INDEX.

NOTE.—The figures in parentheses have reference to the pages in Supplements.

A

Advances in the Science of Water Purification, 861, 889
Advantages of Land Over Artificial Schemes, 162, 206
Advertisement Hoardings, Control of, 885, 897
Aerial Nuisance from Sewage Works, 43, 79
Age Limits for Appointments, 314, 356
A Generous Proposal, 619
Alkaline Waters of the London Basin, 130, 132
Alton, Municipal Work in, 599, 621
American Road Stone Tests, 799
An Anomaly, 155
An Exceptional Opportunity, 513

Annual Reports:—
Belper, 243
Bristol, 220
Calcutta, 839
Cape Town, 640
Fifeshire, 78
Godalming, 635
Johannesburg, 287, 301
Kent, 303
Krugersdorp, 138
Leeds, 281
London, City of, 243
Mid-Lothian, 367
Newcastle-upon-Tyne, 95, 113
Northamptonshire, 73
Sheffield, 653
Tiverton, 879
Warwickshire, 236, 341
Wiltshire, 271, 286
Worcestershire, 879

Antrim Roads, 360
Appointments Vacant:—36, 90, 123, 151, 194, 224, 251, 282, 307, 339, 372, 406, 440, 480, 517, 553, 593, 624, 656, 690, 725, 763, 803, 850, 882, 911
Arbitration Clause, Effect of Recent Decisions upon the, 776, 809
Arbitration Clause, Suggested New Form of, 623
Architects, Officials as, 662, 668
Architects, Tendering by, 887
Architectural Competitions, 668
A Regal Scavenger, 147
Armagh, Road Maintenance in, 289
Artificial Surf Baths, 237
Artistic Treatment of Ferro-Concrete, 388
Asphalt, Macadam, 95, 108

Assistants' and Students' Section:—
Administration, 426
Bending Moments, 394
Books, 22, 301
Building Construction, 611, 749
Cantilever, 504
Cast-iron Stanchion, 464
Concrete Beam, 270
Conversion of Macadamised Road, 464
Deflection of Beams, 174
Design for Highway Bridge, 540
Design of Struts, 868
Floor Construction, 210
Foundations, 898
Hospitals, 75
Hydraulics, 644, 678, 788
Hydrostatics, 868
Leak in Drain Pipes, 142
Masonry Arch, 358
Mechanics, 116, 142, 611, 831
Notes on Reinforced Concrete, 174
Paving, 579
Refuse Disposal, 210
Road Making, 358, 394, 898
Roof Design, 142, 678
Sewage Disposal, 578
Street Gulley, 788
Strength of Materials, 710, 831
Strength of Shafting, 242
Surface Water Drainage, 425
Surveying, 22, 300, 644
Traverse Surveying, 328
Wood Paving, 242, 711

Association of Cleansing Superintendents, 137
Association of Consulting Engineers, 199, 219
Association of Kent Surveyors, 139, 439

Cesspool Emptying, 427, 867
Cheap Heat and Power, 503
Cheltenham, Geology of, 121
Chichester, Sanitary Administration at, 395
Chimneys, Down Draughts in, 675
Chiswick, New School at, 421
Chlorination of Water at Cleveland, Ohio, 389
Chlorine or Hypochlorites? 411, 438
Christmas Gift Problem, Solving the, 879
Civic Government by Commission, 108
Clarification of Sewage, 249
Clitheroe, Municipal Progress in, 171
Coal Washing Water, Pollution of Streams by, 209
Colonel Crompton and Calumny, 410
Colonel Crompton, Functions of, 558, 592
Combined Drainage: Metropolitan Committee's Proposals, 431
Commission, Government by, 486
Compulsory Open Windows, 69
Concrete and Moisture, 629
Concrete, Electrolysis of, 487, 502
Concrete Foundations for Roads and Streets, 630
Concrete in Road Construction, 149
Concrete Institute: Presidential Address, 694, 704
Concrete, Making of, 705
Concrete Paving: Expansion Joints, 8, 32
Concrete Under Water, Methods of Depositing, 28
Concrete Waterproof, 629, 640
Condition of Roads in Ireland, 259
Construction of Isolation Hospitals, 342, 349
Construction, Rapid Methods of, 597
Continental Municipal Engineers' Visit, 575, 614
Continental Visits, 792
Contour Survey of Bushey, Herts, 772, 899
Contractors' Retention Money, 199
Conversion of Old Sewers into New, 225
Copper Sulphate in Purifying Water Supplies, Use of, 30

Correspondence:—
Age Limits for Appointments, 356
Bacteria, 183
Bituminous Materials, 299, 612, 712, 747, 789, 833, 869, 899
Breaking Tests of Concrete Slabs for Road Bridge Floors, 245
Call to Arms, 791
Continental Visits, 792
Contour Survey of Bushey, Herts, 899
Crompton Pavement, 462, 505, 539, 577, 714
Essentials for a Garden City, 274

The Surveyor

And Municipal and County Engineer.

Vol. XLII. JULY 5, 1912. No. 1,068.

Minutes of Proceedings.

Surveyors and their Roads.

A few days ago we were reading a report of an address to engineering students in America, in which there stood out above every other remark and every other argument the statement that what engineers want is not more knowledge and information, but more wisdom. The same principle underlies the interesting letter from Mr. W. H. Baxter which is reproduced in another part of this issue, and the burden of which, if reduced to a practical policy, simply amounts to this—that in road maintenance in this country there should, somehow or other, be brought to bear the broader education, the wider experience and the capacity for appreciating relative values, which have turned local and partial success into general success in other great organisations.

We are not concerned either to criticise or to apologise for Mr. Baxter's methods of putting forward his views. We will only say that, as in other cases, a senior man is entitled to put forward his ideas and the results of his experience with a force which might be regarded as unjustifiable in the case of the best informed amongst junior men in the same profession or concerned in the same affairs. Our readers will not fail to see that a good deal of the substance of Mr. Baxter's letter bears a strong resemblance to much of the matter which has appeared in these columns during the last year or two and previously. As a matter of highway administration we have thought it desirable, and we shall always think it desirable, that if some men reduce the costs of road maintenance considerably and others not only fail to reduce costs but are obliged to face year after year steadily increasing figures for annual maintenance, we should go most carefully into that part of the history of those particular roads which is likely to throw light upon the causes of these differences, entrusting the task of making comparisons and preparing reports to specially qualified engineers whose time would be devoted to these and kindred matters. There is no doubt at all that the practice in one county is in many instances far in advance of the practice in an adjoining or a distant county with respect to similar roads. More than that, there are large areas with similar physical characteristics which may be compared in a way entirely unfavourable to one if we consider the success of the local surveyors in meeting the demands of traffic in another. It is impossible to maintain that all these differences are due to differences in local conditions or in administration or in financial arrangements. As we have frequently pointed out, the best practice of one part of the country is not only not to be found, but is not recognised as a fact, in other parts of the country. The best that can be done with a road crust of ample thickness and made with suitably graded road metal, larger binder and, when necessary, smaller binder, has simply never been approached in some counties. As regards the due proportion of soft binder, Mr. Baxter's remarks are very well worth consideration, and nothing that we have said in favour of the general practice of using considerable quantities of soft binder for roads of a certain class is really contrary to the contention of Mr. Baxter, that on the whole a great deal too much soft binder is used in the construction of road crusts for important roads. A very significant passage is that in which the size of road metal is specified as being determined by the size of a hole, or a *larger* size of a hole in an inclined screen, suggesting the need for definite standards. With Mr. Baxter's criticisms of surveyors generally we are not specially concerned. We leave it to our readers where they feel attacked to reply to definite criticisms and to show, if they deem it necessary, that Mr. Baxter's specific recommendations are either not generally applicable or are wrong.

The Sewerage of New York.

We give elsewhere the suggestion contained in the third preliminary report of the Metropolitan Sewerage Commission of New York. It may probably be taken that the recommendations now made for the disposal of the sewage of the Jamaica Bay division are typical of those which will later be made in the final report for the whole city. In the first report the possibility of collecting all the sewage of New York to one central point for disposal was discussed, with the result that it was found to be impracticable on the ground of expense. The division of the city into several independent areas each with its separate outfall was proposed as an alternative, the possibility of combination at some future date being kept in mind. The second report described the four principal drainage divisions and their requirements. It was pointed out the extent to which New York Harbour needs to be protected is of fundamental importance; that this should be accomplished by means of large collecting sewers and central stations, at which the sewage should be collected and from which it should be discharged after it had received the necessary degree of purification. Further the commission found that

it would not be necessary to keep all sewage out of the harbour, seeing that these waters can absorb a large amount of sewage harmlessly and inoffensively. On the other hand the importance of safeguarding the extensive shellfish interests in Jamaica Bay was emphasised, and one looked forward to the description of some special method of treatment, at any rate for this division.

The commission have, however, only to keep before them the importance of discharging the sewage with a minimum amount of treatment without producing conditions injurious to the public health and welfare, and in the report under consideration they show that, owing to the almost certain development of the shores of Jamaica Bay in order to increase the shipping facilities of New York, it will be practically impossible to use the bay for pleasure purposes and for shellfish culture. Thus, while they do not quite give up the idea of very elaborate sewage disposal works capable of discharging an effluent harmless to shellfish, their estimate only includes settling tanks, filters, and subsidence basins, while all storm water in excess of the ordinary dry-weather flow will have a free outlet after screening. The sludge, which is of course the crux of the whole matter, is to be used to fill in marsh land near the disposal plant, or, if preferred, it can be dumped at sea. One cannot avoid a feeling of disappointment that the commission, after inferring that it would be practically possible to purify the sewage to such a degree that it could be safely discharged in the vicinity of oyster beds, should have come to the conclusion that it will only be necessary to filter the dry-weather flow. Also it seems hardly possible that the dumping of vast quantities of sludge on to the marsh land can be a satisfactory method of getting rid of it. It is well, however, to bear in mind the words of the second report, to the effect that the possibility that a more complete system of protecting the waters may be needed in the distant future, and that this possibility must be kept in mind in preparing the plans. There can be no doubt that, if the shellfish and pleasure uses of the Bay are to be put out of consideration, the proposals of the commission are justified, but experience elsewhere would point to the desirability of dumping the sludge out at sea rather than allowing it to accumulate on land.

A Marylebone Report.

We have received a copy of the last annual report of Dr. Charles Porter, the medical officer of health of Marylebone, which shows that a vast amount of routine and special work has been accomplished by the Health Department during the year under review. The report contains a considerable amount of statistical information which, while being of great public importance, has no special interest for our readers. On the other hand, some of the matters dealt with, such as water supply, housing and combined drainage directly affect both the public health and the engineers' departments. The very useful power given to metropolitan borough councils by the London County Council (General Powers) Act, 1907, to require the provision of a supply of water to the upper storeys of tenement houses has been used with very beneficial results in Marylebone. During 1911 no fewer than 327 such supplies were provided, and in no case was it necessary to issue a summons against the owner. In regard to housing, too, Dr. Porter and his staff have displayed considerable activity. During the year the work of house-to-house inspection has proceeded steadily and has become more distinctly established as one of the routine parts of the administration of the department. The *modus operandi* is as follows: the house-to-house inspector receives his instructions to examine the houses in a certain street, the "sanitary survey" sheets, prepared by the district inspectors, serving as a guide to the streets calling for attention; houses in which defects are noted by him are referred to the district inspectors; the conditions are further investigated by them, notices served and follow-up visits paid till the defects are remedied and the matter written off. Effects of the utmost value in connection with housing have been produced as a result of this work. Numbers of defects have been found which have been remedied under the powers granted by the Public Health Act. Great improvements have also been produced as a result of indirect pressure brought to bear upon owners, who, to avoid the possibility of action being taken in reference to their property under the closing and demolition sections of the Housing, Town Planning, &c., Act, 1909, consented to carry out considerable alterations or even voluntarily to close the premises. In regard to combined drainage, the report shows that Marylebone, in common with the other metropolitan boroughs, finds itself saddled with the cost of maintaining as "sewers" many pipes which were intended as private drains. This admittedly unjust state of affairs must, however, continue pending special legislation dealing with the subject. It only remains to say that the vital statistics of the borough are satisfactory.

* * *

An Attack on the Leadgate Surveyor.

To the eccentricities of human nature, oral and caligraphic, there is no end, but at first blush it would almost seem that a medical gentleman, Dr. Grainger, of Leadgate, had reached something like the finality of extravagant literary style in a letter impugning the character and professional conduct of the surveyor, Mr. W. Robson, which he has sent to the Leadgate Urban District Council. The matter at issue was the conversion of a house owned by Dr. Grainger into two tenements. Mr. Robson had recommended that, owing to the totally inadequate sanitary arrangements for two families, notice should be served on the owner to abate the alleged nuisance by removing one of the tenants. Dr. Grainger's commentary upon this was so extraordinary in tone and style that the councillors, one and all, did not hesitate to describe it as insolent. The author of the epistle opened by alleging that the surveyor had already expressed his approval of the property, and he then proceeded to dot the i's and cross the t's in these choice terms: "I cannot for the life of me see wherein lies his (Mr. Robson's) consistency or his honesty, much less his sincerity, decency, or manliness. Either his tongue or his pen has played the fool with his brain." The letter is punctuated with a series of metaphoric sarcasms, including such phrases as "mad impulse to stagger humanity," "garbled verbosity," "work of an evil mind," "mental twist that should be put under restraint," and "some whim bred of fancy," all directed with the deadly precision of Dreadnought gunnery at the person of the surveyor. The council, obviously not without good reason, characterised the letter as grossly insulting, and concluded to forward it to the Local Government Board. Mr. Robson was, of course, easily cleared of any imputation upon his personal or professional character. One councillor stated that he remembered distinctly what Mr. Robson told the sanitary committee, and he had said the same thing that night. "He felt sure," he added amid the applause of the members, "that the council would exonerate Mr. Robson from all blame in the matter. It was a shame that Mr. Robson, or any of their officers, should be insulted in that unwarrantable and uncalled-for manner, and more especially from a member of an honourable profession."

* * *

Extraordinary Traffic.

The law relating to extraordinary traffic is in itself not a little obscure, and the cases which from time to time arise for decision are usually further complicated by conflicting evidence as to the facts. Such cases are of peculiar importance and interest

just now in view of the fact that heavy mechanically propelled traffic is undoubtedly generally on the increase. We make no apology, therefore, for directing attention to the case heard by Mr. Justice Bray at the Cambridge Assizes, in which the Cambridgeshire County Council sought to recover damages for injury caused to the public highways under their control by heavy traction engines drawing trucks laden with gravel. The defendants' main contention appears to have been that the road in question had been "starved" for several years, so that it was not fit to bear traffic of the kind complained of, which it was submitted was now usual traffic. It was further argued that it was the duty of the council to anticipate and provide for future increased use of a highway. In our view, however, the law was more accurately stated by the plaintiffs' counsel, who submitted that the duty of a highway authority with regard to the maintenance of a road was no greater and no more than to keep it in a state fit for the traffic which it had to bear for the time being. It was further argued on behalf of the defendants that the gravel industry was an ordinary and recognised industry of the neighbourhood, and that the defendants were carrying it on in the ordinary and recognised manner and were therefore, on the authority of *Rayha Highway Board* v. *Monmouth Steam Company*, 1881, 46 J.P., 598, free from liability. The services of the jury were dispensed with at the commencement of the case, so that it fell to the learned judge to decide questions of fact as well as of law, and in the result he gave judgment for the county council and awarded them £534 damages and costs.

* * *

Traction Engines v. Roads.

It would appear to be a universal cosmic law that every form of created thing has some opposing force deliberately and cunningly designed to bring about its speedy destruction—for example, we have cats *v.* mice, Persians *v.* Babylonians, and traction engines *v.* roads; but it is with the last-mentioned antagonistic couple that we are at present more particularly interested. Without running any risk of being unduly complimentary, there is no manner of doubt that that huge, ugly, ponderous monster the traction engine—so common in some parts of the country, is the arch-enemy of road engineers. This unwieldy form of conveyance, with its three lumbering, rickety, and much overloaded trucks trailing behind, is, to the sorrow and regret of all road-makers, unusually common in the county of Kent, where frequent evidence is to be seen of the serious destruction to road surfaces, particularly those coated with tar-macadam. While we are in no sense opposed to mechanical traction of proper form and design, we see no real justification for so cumbrous and destructive a form of transport as the type named. The material to be conveyed is usually such as can be very readily divided up into small parcels or units, such as stone, gravel, bricks and so forth, and it is, perhaps, some small source of comfort to know that the lighter and quicker travelling form of mechanical tractor is fast taking the place of the heavy type of traction engine. There is little doubt that every ratepayer and road engineer will devoutly pray—may they all speedily wear out!

Sanitary Progress in Dumfries.

In addressing the Annual Congress of the Sanitary Inspectors' Association of Scotland, which was held this year at Dumfries, Mr. John Barker, the burgh surveyor, proceeded upon somewhat unconventional lines and made a most interesting excursion into the past history of this ancient town from a sanitary point of view. The records of the council are available from the early days of the sixteenth century, and the extracts which Mr. Barker quoted revealed a condition of affairs which ought to make the present-day inhabitants devoutly thankful for the achievements of modern health science. The existence of a permanent sanitary staff in the service of the municipal authority for Dumfries dates from the year 1704, when George Miller, "indueller in this brugh," was appointed "scaffinger thereof," and it was ordained that the inhabitants should have "tymeous advertisement" of his approach "by touk of drum." It was not, however, until the fearful lessons of the cholera visitations of 1832 and 1848 had been taken to heart that sanitary administration began to develop on modern lines. Even then there was determined opposition to the inauguration of a comprehensive scheme of water supply. This was at last successfully overcome and the works were completed in 1851. They have been improved from time to time and have now reached a high standard of efficiency. Between 1864 and 1871 the problem of drainage was seriously tackled, and since that time there has been continuous extension and improvement, practically the whole of the burgh being now well drained. In 1900 a scheme of sewage purification was undertaken at a cost of over £40,000, and these works are at present in excellent order. Dumfries may now claim to be thoroughly up to date as regards sanitation, and the efficiency which characterises its municipal administration reflects great credit upon all concerned.

* * *

Concrete Paving: Expansion Joints.

The notes from an account of experience with concrete paving in an Iowa city which will be found on another page of this issue relate, as far as results are concerned, almost exclusively to residential streets, the paving of which is receiving much attention in America just now. The drawbacks to the use of monolithic concrete are so well known by some of us that it is not a matter for surprise that the commissioner of Davenport found it desirable to reduce the sizes of his concrete slabs; and some of our readers will perceive that his experience suggests very strongly the advantages of paving with blocks rather than with large slabs. Mr. Compton thinks that as soon as actual tests have proved some scheme for protecting expansion joints, concrete paving will be a success; but another solution is to make the joints so small that they will not need to be protected. This is achieved, with stone, by making small blocks with joints as thin, or almost as thin, as it is possible to get them. Whether it will be found to be good practice to make some compromise between the block method and the large slab method, with wide expansion joints, remains to be seen. The suitability of concrete for a road crust is a separate matter which need not be considered in the present connection, but it may be pointed out that a sand-cement mortar is by no means likely to provide a satisfactory wearing layer.

* * *

A Batley Accident.

An unsuccessful claim against the Batley Corporation was recently made in the Dewsbury County Court. It appears that the corporation have acquired some property which includes some old cellar dwellings, for the purpose of effecting an improvement in Commercial-street. These cellar dwellings are not fenced off from the footpath, and the first step down encroaches nearly a foot on the public way. The plaintiff in the case claimed damages in respect of injuries which he sustained by falling down the steps when passing along the street at about 11 o'clock on the night of November 3rd. The case contained one or two curious features, as the plaintiff did not consult a doctor for some weeks after the accident, and it further appeared that an injury to his hand which had been included in his original claim was not due to the accident at all. The plaintiff was ultimately non-suited on the ground that there was no obligation on an owner to fence property adjoining a highway.

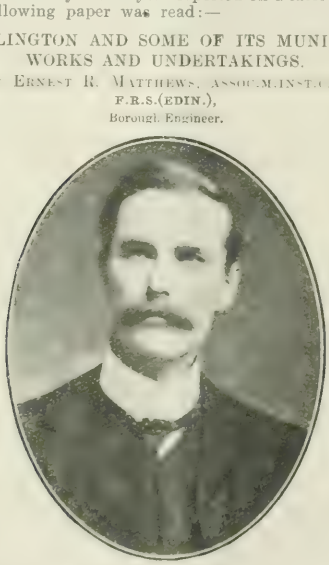
Institution of Municipal and County Engineers.

NORTH-EASTERN DISTRICT MEETING AT BRIDLINGTON.

An altogether pleasant time was spent by those members of the Institution of Municipal and County Engineers who took part in the district meeting of that body on Saturday last. During the greater part of the day the weather was all that could be desired, and the visits which followed the business proceedings were carried out according to the programme laid down. In addition to an account of the municipal works of the town furnished by the borough engineer, Mr. E. R. Matthews, a paper descriptive of the town's waterworks was submitted by Councillor Charlesworth, an interesting discussion following the presentation of the two contributions. The members were the guests of Mr. Frank Massie, the district chairman of the institution, at a luncheon given at the Britannia Hotel, and in the course of the afternoon inspections were made of the Royal Prince's Parade, the Victoria sea defences, waterworks, and other undertakings. Those present at the meeting included: Messrs. A. Beaumont (Beverley), T. C. Beaumont (Driffield), J. E. H. Burton (Wakefield), H. T. Calvert (Wakefield), S. Charlesworth (Bridlington), S. R. Crofts (Bridlington), J. H. Drew (Wath-upon-Dearne), S. Dyer (Bridlington), A. E. Everingham (Bridlington), P. Gaskell (Hull), W. Gibson (Bridlington), A. D. Greatorex (West Bromwich), president, A. E. Green (Castleford), W. Green (Castleford), J. S. Grunwell (Bridlington), J. T. Hill (Bridlington), F. M. Hindle (Chadderton), C. J. Hodgson (Otley), A. Hudson (Wakefield), W. Hudson (Bridlington), J. S. Hurst (Bridlington), L. Ives (Wakefield), J. A. Iveson (Scarborough), A. Light (Otley), F. E. Massie (Wakefield), S. Mason (Grimsby), A. E. Matthews (Bridlington), E. R. Matthews (Bridlington), H. H. Oakes (Ventnor), E. Picker (Beverley), H. Richardson (Scarborough), A. J. Roussell (Whitley and Monkseaton), E. J. Silcock (Westminster and Leeds), J. F. Smillie (Tynemouth), H. W. Smith (Scarborough), J. G. Smith (Beverley), C. G. Southcott (Bridlington), J. Southwart (Rothwell), T. J. Trowsdale (Annfield Plain), T. L. Watchman (Annfield Plain), and W. Welburn (Middleton). Following the official reception of the members by the mayor—reported on a later page—the following paper was read:—

BRIDLINGTON AND SOME OF ITS MUNICIPAL WORKS AND UNDERTAKINGS.

By Ernest R. Matthews, Assoc.M.Inst.C.E., F.R.S.(Edin.),
Borough Engineer.



Bridlington, although one of the oldest corporate towns in the country, is nevertheless one of the most popular health resorts. The town lies due east and its sea front stretches along the shores of one of the finest bays to be found around the coasts, having as Brid[illegible] Head at its north end, and Flamborough Head at its south, the noble promontory which has proved a harbour of refuge for so many mariners during northerly gales. Immediately to the north of Flamborough are Bempton and Speeton where the cliffs rise in places to over 400 ft. The quay existed as a port in Norman times, being mentioned in the charter of King Stephen, confirming to the priory the revenues of the harbour.

PLACES OF INTEREST IN AND NEAR BRIDLINGTON.

Bridlington Priory. — The Augustinian Priory of Bridlington was founded by Walter de Gant, the Norman Lord of Bridlington, in the reign of Henry I. Its charter included the revenues of the harbour, which King Stephen confirmed, with the right to all wrecks on the Flamborough coast. It gradually acquired the rectories of the surrounding parishes, including Filey and Scarborough, and lands in almost every parish in this part of the East Riding. Its nearness to the coast rendering the priory subject to

Mr. J. S. Hurst.
Deputy Borough Surveyor, Bridlington.

descents of sea rovers, it was fortified in the fourteenth century. Of its defences there remains only the principal gateway, there having been originally three others. The church in its present form consists of a nave and side aisles with two western towers. Its dimensions are: Length, 185 ft.; breadth, 78 ft.; height, 70 ft. The original design appears to have been similar to that of Beverley Minster, and the dimensions not inferior.

The Bayle Gate.—The priory entrance, known as the Bayle Gate, near the north end of St. John-street, spans the approach to the precincts of the church. It has two archways, the main and a small side postern, each with beautiful recessed mouldings. Over the main arch is a shield with the three B's, the priory arms. The tower is of three low storeys, the two lower pierced for archery, the upper having three small Early Perpendicular windows. Four buttresses, dividing the front of the tower into three parts, complete the feature of an extremely simple but exquisite architectural composition. The lower rooms of the tower, formerly the porter's lodge and manorial prison, became in later times the town kydcott or lock-up; and the upper chamber, which was the prior's manorial court, became the meeting-place of the lord's feoffees for the transaction of their business. The vista through the main archway towards the western façade and south side of the church is one of the most beautiful views of the kind in England.

Danes' Dyke. This prehistoric wonder is a vast entrenchment, somewhat of the same kind as those which are found in various parts of the Yorkshire wolds. The many flint implements found here in experimental excavations prove that it is of an age earlier than that of the ancient Britons. Danes' Dyke can be easily reached by a short walk about 2 miles along the cliffs in a northerly direction from Bridlington.

Holderness Coast—Coast Erosion.—The coast line extending in a southerly direction from Bridlington to Spurn, about 35 miles in length, is known as the

Holderness Coast of Yorkshire, and has been discussed more than any other portion of our coasts, for the average rate of erosion on this coast is about 11 ft. per annum, and greater than found elsewhere. Many towns and villages which were previously located here have long since disappeared, the sites of some of them being now covered by several fathoms of water at high tide.

When giving evidence before the Royal Commission on Coast Erosion some time ago, the author stated that he estimated that 1 904,194 tons of cliff were washed away annually from this coast, and that since the Roman invasion 115 square miles of land had disappeared between Flamborough Head and Spurn; also that the coast line at that time was about 3 miles further seaward than at present.*

As to the erosion, what is actually taking place is as follows. The boulder clay composing the Holderness cliffs consists of clay, sand, gravel and larger stones; the pummelling action of a wave at the base of the cliff in a short time causes huge fissures to occur in the cliff—these in time open out, until a mass of the cliff falls on to the foreshore. The action of the sea on this is to disintegrate the mass, washing away the sand and fine gravel, and converting the clay into mud, which is also washed away. The larger stones and coarse gravel remain, and these are washed up to the foot of the cliff, affording in a small degree a sort of natural protection to the cliff. Some of the extensive sea defence works (designed by the author) erected during the past few years will be described later. Other places of interest near Bridlington include—

Rudstone (about 6 miles from Bridlington).—In the churchyard of this village, near the north-east corner, is a wonderful monolith of great antiquity, standing some 25 ft. high, and tapering gracefully to the summit; it is said to extend as far below ground as it rises above it. The church has a Norman tower and is itself of great beauty.

Flamborough Caves and Rocks.—A great feature of Flamborough Head is its caves, which are approached by boat from the north landing, and its lighthouse near the south landing. Scores of conveyances (motor and horse) leave Bridlington daily during the season for Flamborough, the charges being: Motor chars-à-banc 1s. 3d. return, horse chars-à-banc 1s. return.

Bempton, Speeton and Burton Agnes.—These are interesting villages a few miles from Bridlington and are well worthy of a visit. The two first-named are the home of the birds' eggs collecting industry.

Filey, Scarborough, and Beverley are also within easy reach of Bridlington.

Other places of interest in Bridlington include the Royal Prince's Parade owned by the corporation, the new spa and gardens, the harbour, and the unsurpassed sands (the children's playground).

GENERAL STATISTICS.

The resident population of Bridlington is 15,000 (if the census had been taken a month later it would have been about 17,000, so many houses being locked up for the winter), the sleeping population during the height of the season being nearly or quite 60,000.

Borough incorporated 1899; rateable value (1912), £96,405; area of borough, 2,751 acres.

Death-rate (1911), 14·81; birth-rate (1911), 20·09.

The rainfall for 1911 was 26·44 in.; the average rainfall for the past five years, 26·55 in.; hours of sunshine (1911), 1,755.

Number of houses in the borough, 4,018, of which only about 40 are empty. Number erected during the past 13 years, 1,200.

Levels: between 21 ft. and 200 ft. above ordnance datum.

Rates.—District rate 7s. 10d.; poor rate (including the county and other small rates and borough rate (3d.), 2s. 6d.; total, 6s. 4d.

SEWERAGE AND SEWAGE DISPOSAL.

Sewerage System.—Up to the year 1878 the drainage system of the district was most defective, several old brick culverts with flat bottoms and arched tops, and built in 4½-in. brickwork with open joints, forming the main sewers of the town. The outfalls were into the harbour and direct on to the north foreshore respectively. The matter came before the Local Board in the year named for their serious consideration, the result being that they instructed Messrs. Brierly & Holt, civil engineers, of Hull, to prepare a main drainage scheme. This they did, and the Local Government Board held an inquiry the same year and sanctioned it, the estimated cost being £11,000. At that time there were in the district only 690 water-closets. This number has since increased to 3,427. The percentage of water-closets to number of houses in 1880 was 33, in 1899 it was 60, to-day it is 80; water-closets have to be put into all new houses. Under this scheme the total length of sewers put in was about 6½ miles, including a 24-in. cast-iron pipe outfall. Several old existing pipe sewers were picked up in connection with the new system.

Between 1880 and 1899 the town developed very rapidly, the population increasing from 7,760 to 12,482. During this period 12 miles of additional sewers were laid and connected up to the main drainage system, and a 12-in. cast-iron pipe outfall was also laid on the north foreshore at the extremity of the borough, and extending well below low-water ordinary spring tides. To this outfall a number of sewers in that part of the town were connected.

In 1899 the author was instructed to examine the sewers in the borough and report as to their efficiency; this he did, and presented a scheme for the remodelling of the system, which included the laying of over 2 miles of surface-water sewers, the construction of 3-ft. by 4-ft. 6-in. in place of 2-ft. by 3-ft. egg-shaped sewers (Fig. 1), and 2-ft. 4-in. by 3-ft. 6-in. egg-shaped sewers in place of 24-in. pipe sewers; also the enlargement of a number of other sewers, the construction of a new screen chamber on the south side of the harbour, the reconstruction of the old screen chamber, and the laying of a new 30-in. cast-iron flanged outfall sewer under the south pier and across the sands in a southerly direction to low-water mark of ordinary spring tides, discharging within a few feet of the old outfall sewer. The outer 615 ft. of the outfall is carried by 12-in. by 12-in. piles (pitch pine), as shown by the drawings.

The scheme also included the putting in of a large number of additional manholes and lampholes, and the building of fourteen automatic flushing tanks, these discharging from 300 to 500 gallons each; twelve additional ventilating shafts were also erected.

The Local Government Board sanctioned this scheme in 1900; the contract was let forthwith, and the whole of the work has now been completed, the total cost being about £12,000.

The redrainage of the Hilderthorpe district was not included in this scheme, but the rapid development of that part of the borough during the past five years has recently necessitated the taking up of several of the sewers and substituting larger ones, and this work has just been completed at a cost of £650. Thus the South Cliff-road 18-in. pipe sewer has been replaced by a 30-in. sewer of concrete tubes laid 4 ft. deeper than the old sewer. The 15-in. pipe sewer in Pembroke-terrace roadway has been replaced by a 24-in. sewer of concrete tubes; these also are laid 4 ft. deeper than the old sewer. A new 15-in. stoneware pipe sewer has also been laid in Hornsea-avenue. New manholes have been built in place of the old ones, and several additional manholes have been added. During the summer months the sewage is screened before being turned into the sea. It discharges at all states of the tide.

WATERWORKS.

The Bridlington waterworks were established in 1865 by the Bridlington and Quay Water Company, Limited, and the works were purchased by the corporation in 1899, the amount borrowed being £70,000. Some important extensions and improvements, costing about £13,000, have recently been carried out, and in connection with these Mr. F. J. Bancroft, B.SC., M.INST.C.E., was engaged to advise the committee. The new pumping station was designed by the author (see Fig. 2), and may be briefly described as follows:—

The cost of these buildings was £2,400, which works out at 4½d. per cubic foot.

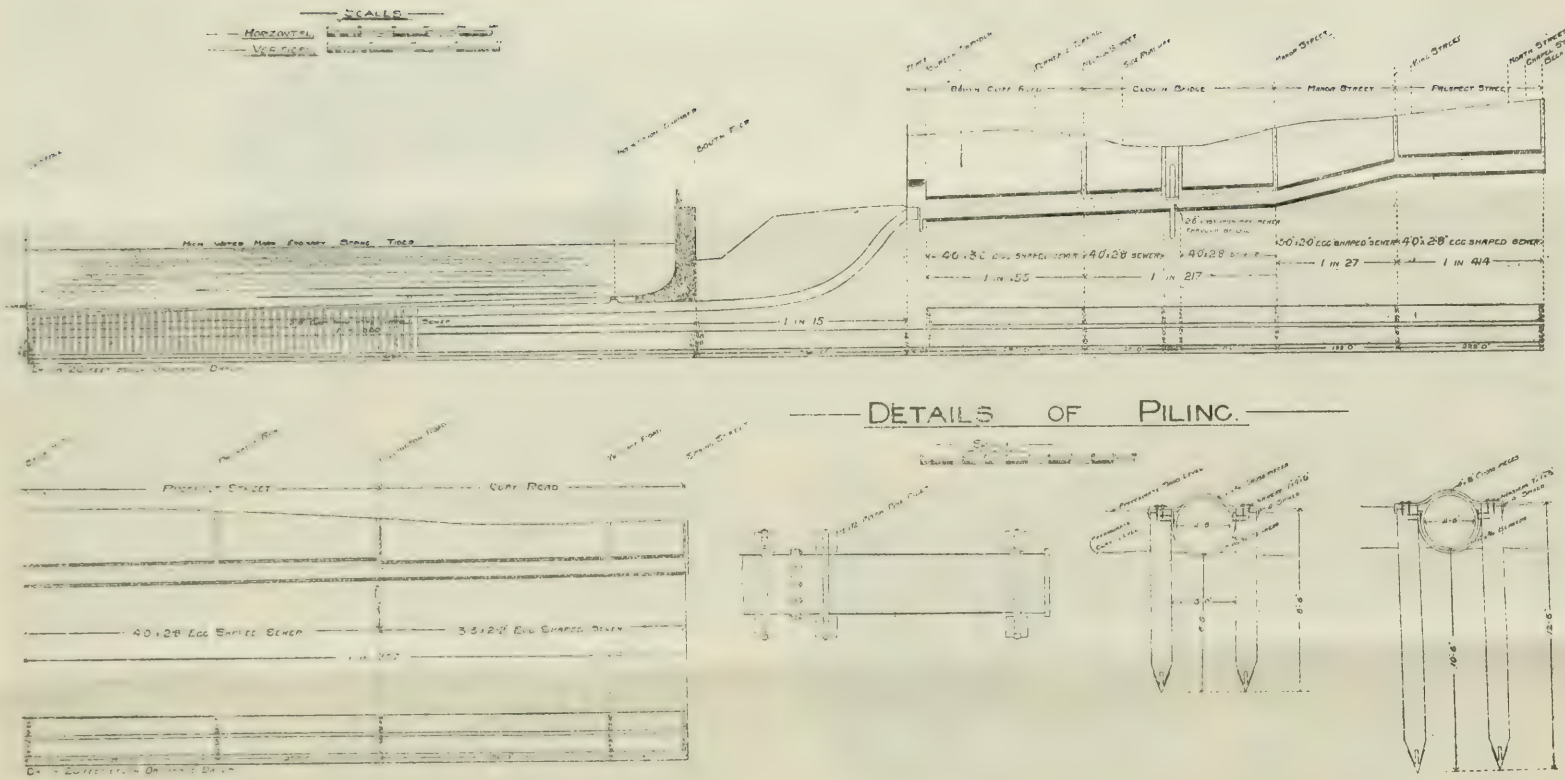
Engine-House.—Floor area, 54 ft. by 28 ft. equals 1,512 ft. super. Height, from upper floor level to underside of girders carrying overhead crane, 14 ft. 3 in.; height to bottom of steel roof trusses, 21 ft. 3 in.; height between bottom and top floors, 9 ft. 6 in.

Boiler-House.—Floor area, 55 ft. by 23 ft. equals 1,265 ft. super. Height (to eaves), 17 ft.

Coal Shed.—Floor area, 42 ft. by 20 ft. 6 in. equals 861 ft. super. Height (to eaves), 11 ft.

E

* Further information on the subject will be found in "Erosion on the Holderness Coast of Yorkshire," by E. R. Matthews (Min. Proc. Inst. C.E. 1904-5); "Coast Erosion and Protection," by E. R. Matthews (*Engineering*); "Towns and Villages which have Disappeared from the Yorkshire Coast," by E. R. Matthews (*Contractors' Record*, June 16, 1909).



REMODELLING OF SEWERAGE SYSTEM, BRIDLINGTON.

(Plate 1.)

Workshop.—Floor area, 29 ft. 6 in. by 20 ft. equals 590 ft. super. Height, 12 ft. 6 in.

The works have been properly drained into the corporation sewer in Scarborough-road. For a fuller description of these buildings see THE SURVEYOR.*

The new machinery has been put in under the supervision of the waterworks manager, Mr. Walter Gibson, who has devoted much care and attention to the overlooking of this important work. The new plant will be described in a paper to be read by Mr. Councillor S. Charlesworth (retired mechanical engineer), deputy-chairman of the Waterworks Committee, and a member of the Works Sub-Committee. The mayor, Mr. Alderman L. Mainprize, J.P., is the chairman of this committee.

STREETS AND ROADS.

The length of roads maintained by the corporation is 33 miles. In the quay portion of the borough some of the streets are very wide, Queen-street being 85 ft. in width, Prince-street 100 ft., and Promenade 60 ft.

Tar-Macadam Roads.—There are several miles of tar-macadam roads, and these consist of 2-in. Scotch granite mixed with boiling tar, and laid to a thickness of 4 in. upon a foundation of brickbats; in some cases where the traffic is heavy the centre of the road has a thickness of 6 in. of tar-macadam. A sprinkling of whinstone chips, and in some cases of fine sea gravel, is added while the road is being rolled.

Where there is light traffic, the top layer of tar-macadam consists of 1½-in. stone. The author has erected a furnace and tar-mixing shed, where the materials are dried before mixing.

Ordinary Macadam Roads.—The macadam roads of the town, for the most part, have a chalk foundation; and, where the thickness of metal in the road is not considerable, in severe frosts the expansion of the chalk causes the road to break up. Two-inch and 2½-in. whinstone, obtained from Messrs. Ord & Maddison, of Darlington, is used for the metalling of the roads.

Tar Surface Treatment.—A great many of the roads in the quay portion of the borough have their surfaces tarred, and this is found to be very beneficial in allaying the dust and lessening the noise caused by the traffic on such roads. The method adopted in tarring the roads is as follows:—

A gang of men, eight in number, first sweep the road surface, the tar (cold) is then applied to the road by hand with ordinary brushes. The work only proceeds when the weather is most favourable, hot, sunny days being selected for this. On top of the tar thus applied ¼-in. screened whinstone chips are then spread, or ¾-in. screened slag, and these are rolled in by a 10-ton steam roller, and the traffic is allowed on the road almost immediately. Tar surface treatment is only applied to roads that are in a good state of repair. The corporation have recently asked the county council to purchase for them a tar-spraying machine.

Tar-paved Footpaths.—Most of the footpaths in the borough are tar paved, the surface being retarred about once in every three years; the tar is applied by hand, limestone dust is spread on the surface, and is rolled in by a 15-cwt. hand roller.

Flagging.—In many of the streets the footpaths are paved with York stone flags, and in a number of the principal business streets the author has laid 2½-in. "Non-slip" artificial stone flags, which, in his opinion, are preferable to ordinary York stone flags. Good examples of work of this kind may be seen in Prince-street, Bridge-street, Cross-street and St. John-street. The cost of laying these flags is given later in a tabulated statement.

Asphalt Footpaths.—The asphalt footpaths consist of tarred limestone laid to a depth of 2 in., and put on in two layers, coarse and fine, and upon the surface of the footpath Derbyshire spar is sprinkled.

STREET WIDENINGS.

The corporation have spent a very great deal during the past ten years in carrying out street widenings and improvements.

Cross-street Widening.—Cross-street was widened from 19 ft. (building to building) to its present width of 50 ft., at a cost of £3,650. The road was covered with tar-macadam, laid in the manner previously described; 12-in. by 7-in. granite kerb was laid, 10-in. by 5-in. York stone channel, and the footpaths were flagged with 2½-in. "Non-slip" flags, and are 8 ft. 6 in. and 9 ft. in width respectively.

Bridge-street Widening.—This street was widened in 1903 from 24 ft. in its narrowest part to 50 ft. in its narrowest part, at a cost of £8,200—£5,084 of which came back by the re-sale of the building sites. A mass concrete retaining wall was built on the east side of the street, and upon this the fronts of the houses and business premises on that side of the street are built. The road and footpath were constructed similar to Cross-street, and this is now the principal street connecting the Quay and Hilderthorpe portions of the borough.

St. John-street Widening (Fig. 3).—This is by far the most important street widening which the corporation have undertaken, and has cost over £30,000. It has been necessary in carrying out this work to pull down about sixty houses, including a public-house and a chapel. Most of the surplus land has been re-sold; new lavatories have been built at the north end of the street, and the present average width of the road is 52 ft., compared with about 20 ft. previously; 8-ft. footpaths have been constructed on the east and west sides of the street. On the east side the footpath is flagged with "Nonslip" flags, and on the west it is covered with asphalt. The kerbing consists of 10-in. by 7-in. hard York stone kerb, and the channel 10-in. by 5-in. York stone. The road is metalled with 2-in. whinstone, laid to a depth of 6 in. on a good brick-bat foundation, which is 12 in. in thickness.

Corporation Horses and Carts.—The highways department have nine horses, which are stabled at the corporation depot, the stables being described later. Three of these horses are used for gathering street sweepings, and are light horses, which are used in connection with the fire brigade when required.

The highways department have to hire a good many horses, and the price paid per day for horse, cart and man is 7s., or if by mileage carting metal to outside roads, for example, the price is 8d. per ton per mile.

Cost of Materials.—(When by rail, includes delivery to Bridlington Station; or, if by boat, delivered into corporation carts):

CARRIAGEWAYS.	per ton. s. d.
2½-in. whinstone	11 3
2-in. ,,	11 6
1½-in. ,, ...	11 9
Whinstone chips .. .	7 1
Unbroken whinstone	9 6
2-in. Scotch granite (by boat)	8 6
Tar painting and coating with whinstone chips, 1½d. per sup. yd.	
Tar-macadam, 3s. per sup. yd.	
Brick bats, 2s. per load and cartage.	

FOOTWAYS.
Tar painting and coating with limestone dust or fine sea gravel, 1½d. sup. yd.
"Nonslip" flags, 6s. 2d. laid, or 5s. 6d. not laid.
2½-in. York flags the same as "Nonslip" flags.
Concrete *in situ*, 3s. 6d. per sup. yd.
Asphalt, 1s. 6d. per sup. yd.
10-in. by 7-in. kerb, 3s. 3d. per yd. laid.
10-in. by 5-in. channel, 2s. 5d. per yd. laid.
Limestone dust, 9s. per ton.
Sea gravel for concrete, 3s. 9d. per ton at depot.

Rates of Wages paid to Highways Workmen.—Road foremen (two), 29s. per week each; stable foreman, 29s. per week; road roller drivers, one at 28s., one at 26s. per week; mason, 8d. per hour; road sweepers, 23s. per week and 6d. per hour overtime; general labourers, 23s. per week and 6d. per hour overtime; cartmen, 23s. per week and 6d. per hour overtime; temporary men, 5½d. per hour. Number of hours worked per week, 55½ in summer and 50 hours in winter. Stone breakers, 3s. per ton, whinstone; cobbles, 2s. 6d.

The average number of men employed in the highways department, 50.

PRIVATE STREETS.

Private streets are made up and taken over under the Private Street Works Act, 1892. About forty-five of such streets have been taken over by the corporation since the author's appointment. On the south side of the town many of the roads, it will be seen, are in a deplorable condition, and there is no doubt some of these will be taken over in the near future.

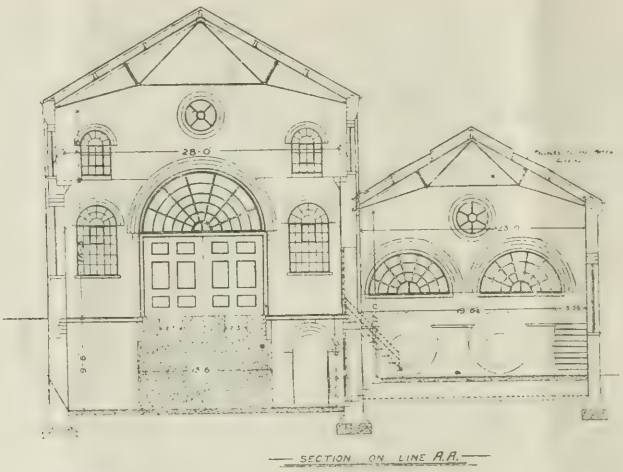
The method of constructing private streets (when being taken over) is the same as that already described in connection with the construction of St. John-street, except that the footpaths are all asphalted. The average cost of private street improvement works is 4s. 6d. per foot frontage. The work is carried out by direct labour. This may seem a very low figure, but in nearly every case the kerbing and channelling has already been put in.

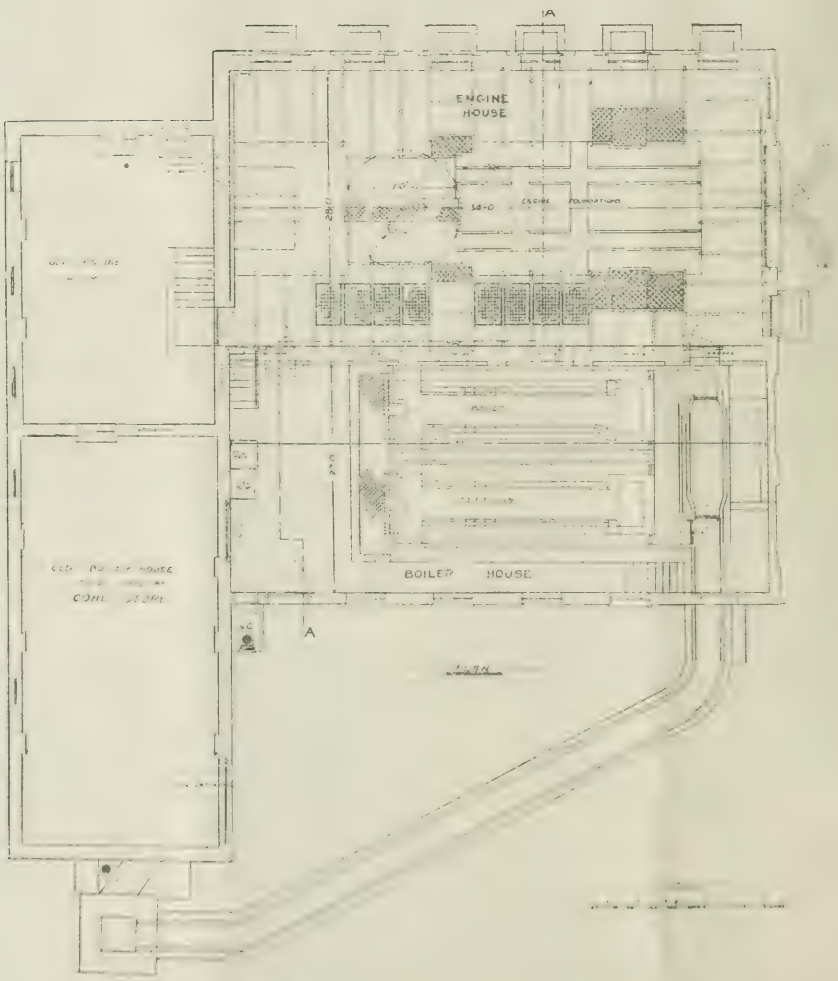
Back Roads.—A number of back roads have also been taken over; these have been covered with tarred macadam on a good brick-bat foundation, and they drain on to a centre channel.

SEA DEFENCE WORKS AND SEA FRONT IMPROVEMENT WORKS.

Bridlington has a frontage towards the sea of about 2 miles. 1 mile south of the harbour and 1 mile to the

* "Notes on the Designing of Modern Waterworks Pumping Stations," by E. R. Matthews, April 23, 1909.





Pumping Station Bridlington New W[illegible]

(Plate 2.)

north. The protection of the portion immediately to the south of the harbour has been carried out by private landowners *viz.*, Messrs. Whitaker Bros. Beyond this a sea wall has been erected by Mr. J. W. Pitt, but this sea defence is just outside of the borough.

On the north side of the borough the corporation have spent during the past forty years in protecting the town against the inroads of the sea and in carrying out sea front improvement works over £100,000, an amount which is larger than the rateable value of the borough.

The works carried out by the author include: The extension northwards and seawards of the Royal Prince's Parade, the construction of the Victoria sea defences, and of the southern portion of the Sewerby sea defences, and of the erection of seventeen groynes upon the foreshore (see Fig. 4). Space will not permit in this paper of a full description being given of these, so that if the members require any additional information on this subject they will find same upon reference to a paper read by the author before the Institution of Civil Engineers, in 1904, on "Erosion on the Holderness Coast of Yorkshire," and one read by him before the Society of Engineers in May, 1905, on "The Parade Extension Works at Bridlington," also in a series of articles on "Coast Erosion and Protection" appearing in *Engineering*.

Royal Prince's Parade.—This is undoubtedly one of the most popular places of resort at Bridlington. The massive sea wall, with the promenade and gardens at the back of same, were constructed about forty years ago, and power was obtained for the parade to be enclosed and a charge made for admission. Since that time, however, it has been so considerably improved and extended that those who have not seen this popular promenade for twenty years would scarcely recognise it to-day. There is covered accommodation for nearly 6,000 people; the grand pavilion at the north end of the parade seats 2,300; here the entertainments, under the supervision of the able manager, Mr. Chas. Palmer, are exceptionally good, some of the best troupes of artists that can be secured being engaged. The floral pavilion, so named because of the delightful manner in which it has been florally decorated by the town's gardener (Mr. S. R. Crofts, A.R.H.S.), also enables visitors to bid defiance to the weather; this building seats about 1,500 people, and it is here that Signor Scoma's well-known municipal orchestra plays during the height of the season three times daily. The Victoria Rooms, a small theatre at the south end of the parade, also provides further entertainment for the people in the shape of cinematograph shows; this theatre seats about 800 people, and has recently been reconstructed throughout, redecorated and re-seated, at a cost of about £400.

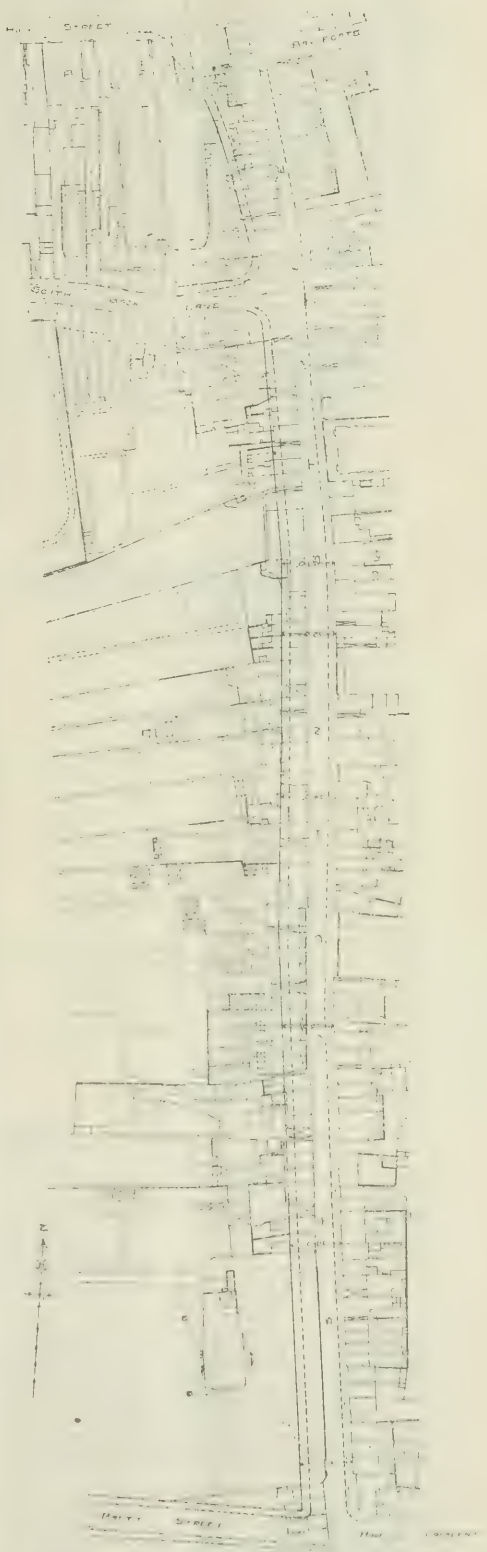
There are also several ornamental colonnades on the parade which afford further shelter.

The floral clock upon the parade is admired by many, and it keeps excellent time; and during the season of 1911 the floral crown designed by Mr. Crofts was a source of great interest. The parade is frequently the scene of fêtes, galas and illuminations, and, being lighted throughout with electric arc lamps, makes an ideal evening lounge. The takings on the parade for the year ending March 31, 1911, were £12,749; the number of tickets sold was 151,634, which does not include special tickets sold on gala nights. The profit was £3,314, and the amount handed over in the relief of rates was £1,750, which equals a rate of about 4½d. in the £, a 1d. rate producing £380.

The lower promenade on the parade has been re-asphalted throughout last spring at a cost of £253 or 1s. 5d. per. super. yard for the asphalting, the cost of preparing the foundations not being included in this. The work has been executed, under the author's supervision, by Messrs. Josiah Smart & Son, of Westminster, the specification being as follows: Total thickness of Derbyshire limestone asphalt, 2 in.; number of layers, two; size of spar sprinkling, ⅜-in.; size of stone in first layer of asphalt, 1 in.; in top layer ⅜-in.

The extension of the Royal Prince's Parade, which the members will no doubt inspect, and the construction of the Victoria sea defences immediately to the north of the parade, were completed in July, 1906, and formally opened, together with the Grand Pavilion, by the Lord Mayor and Sheriffs of the City of London, in the presence of the Lord Mayors and Mayors of most of the cities and boroughs of Yorkshire.

New Sea-Walls.—The new sea-walls are faced with Bramley Fall rock-faced stone, to match the old

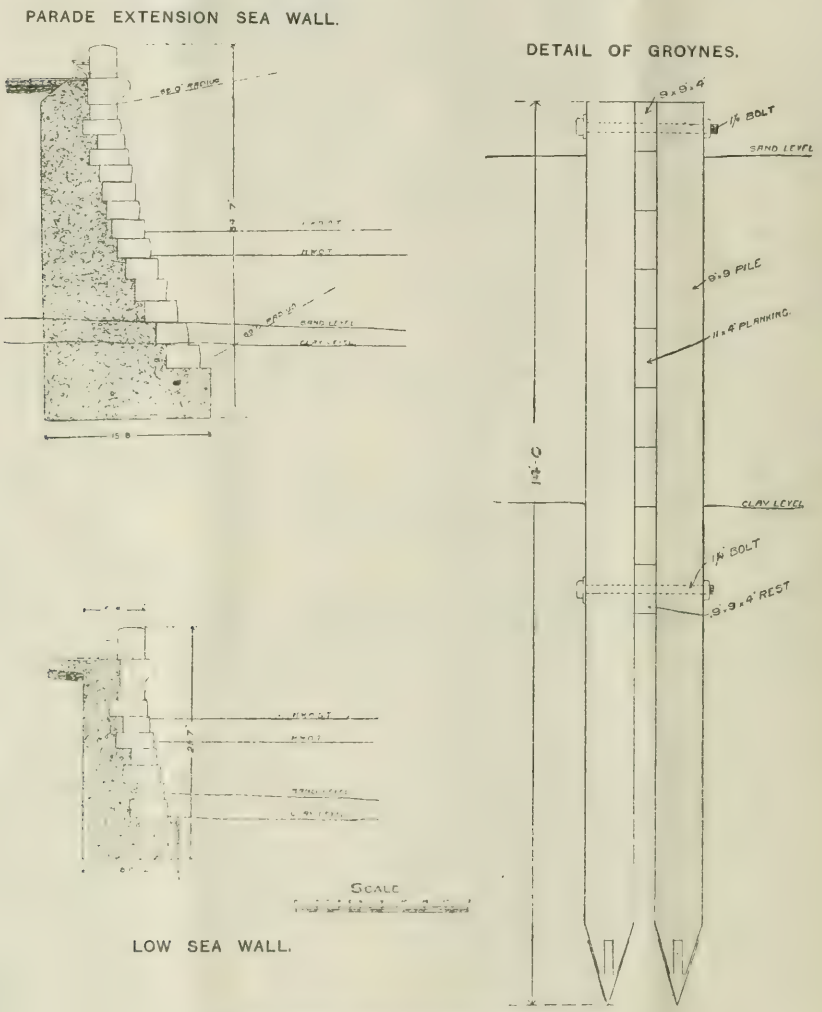


St. John-street Improvement, Bridlington.
(Plate 3.)

Prince's Parade sea-wall. They are built with a stepped face, which, in the author's opinion, is the best type of construction—he considers that where stone can be brought to the site at a fairly reasonable rate, that is the best form of sea wall to construct, as the first cost is the last. The old Prince's Parade wall, which was constructed, as previously stated, forty years ago, has not cost one penny in repairs, except for occasional pointing of the joints. Not only so, but the author's experience teaches him that a wall with a smooth face, especially if it be a curved face, creates a very much greater scour at the base than a wall similar to those under consideration, as the stepped face breaks the force of the wave and pletely tore out the outer half of one of the concrete blocks, and severely damaged several others."*

The cost of the improvements just named—that is, the Parade extension works, new Victoria sea defences, and the Grand Pavilion, was just over £40,000, the Grand Pavilion costing £12,000. This building was designed by Messrs. Mangnall & Littlewood, architects, Manchester, and was the selected competitive design. The foundations, which were of concrete and reinforced concrete, were put in by the author, and certain improvements to the building, particularly the balcony, have since been made by him.

Adjoining the pavilion is a commodious café, sur-



Bridlington Sea-wall and Groynes.

Plate 4.)

becoming a scour at the base of the wall very materially. Walls built of concrete *en bloc* the author appreciates, as they are a constant source of expense. The Alexandra sea-wall at Bridlington is of this construction and is a continual expense, the face of the wall having to be frequently repaired, only the pointing of last year costing £50 in repairs. The stone used in the new sea-walls at Bridlington came from the Leeds district, the railway rate being 6s. 6d. per ton.

* Undoubtedly the most suitable stone to face a sea-wall with is granite or basalt, especially where the foreshore is shelly shingle and H.W.O.S.T. rises to the wall. The author has known cases where a granite wall has been faced with concrete blocks and the force with which the shingle upon the shore was hurled against the wall during a heavy sea com-

mounded by a roof garden. These improvements and extensions were necessary owing to the increased popularity of the Parade.

The terraces at the back of the low sea-wall are paved with 2½-in. "Non-slip" stone flags on concrete; the steps leading from one terrace to the next are of granite, and those which are reached by the sea are of special construction. On the third terrace a large colonnade has been erected, which accommodates several hundreds of people, and the portion of the sea front, as you know, is open to the public.

Floral Pavilion.—The building was erected in 1905, from the designs of Messrs. Mangnall & Littlewood, and has since been considerably improved by the author. It is constructed of wood, iron and glass,

* "Coast Erosion and Protection," by E. R. Matthews (*Engineering*).

with glazed folding shutters at the ends of same, and is a favourite resort with both visitors and residents alike. The cost of the building, including the bandstand, was about £4,080. The Property Committee are now considering the advisability of extending this building, as it is found that if it were double the present size it would not be too large.

Other recent improvements on the Parade include new lavatories for both sexes, and a number of lock-up shops, while the floral clock before referred to and the delightful flower beds add to the charm of the place.

The charges for admission to the Parade are as follows: Day tickets, 6d.; week-end (Saturday to Monday), 1s. 3d.; Friday to Tuesday, 2s.; weekly, 2s. 6d.; fortnightly, 4s. 6d.; three weeks, 6s.; monthly, 7s. 6d.; season, 21s.; children half-price. Bath chairs and perambulators are charged for, and there is an extra fee to pay on the evenings when galas, including firework displays, &c., are in progress.

Groynes.—These may be briefly described as follows:

"The author recommended that the timber groynes adopted should extend seaward, 300 ft. from the sea-walls, but this distance was reduced to 200 ft., on account of the inconvenience which the longer groynes would cause to persons driving along the sands, as low-water mark of ordinary tides is only 390 ft. from the sea-walls. The groynes are constructed of pitch-pine piles and planking. The piles, 9 in. by 9 in., and 14 ft. in length, are shod with 18-lb. wrought-iron pile shoes, and are driven 8 ft. into the boulder clay in pairs, leaving a space of 4-in. between the piles. The pairs of piles are placed 7 ft. 6 in. apart, centre to centre. Planking, 11 in. by 4 in., is inserted in the spaces between the piles, the bottom plank being put down entirely into the clay. At every alternate set of piles a bearer is bolted on for the bottom plank to rest upon. At the intermediate sets of piles the bottom plank is bolted to the piles instead of resting on a bearer, the object being to save excavation around the piles as much as possible, so that their stability shall not be impaired. A crosspiece is fixed at the top of the piles to prevent the latter from rising. The groynes are so arranged that a depth not exceeding two planks usually projects above the sand level. As the sand accumulates, which it does most rapidly when the wind is blowing off-shore, additional planks are inserted, and the groyne is raised without any trouble. The planks are so arranged that one plank spans two bays, and the next three bays, and they are inserted so as to break joint."* The first four (experimental) groynes cost £718, or 18s. per lineal foot, and the remaining thirteen at the rate of 12s. 3d. per lineal foot. This was, however, an exceptionally low tender.

BOROUGH SANATORIUM.

The borough sanatorium, designed by the author, was erected in 1902 at a cost, including purchase of land, erection of buildings and boundary walling, drainage, oil engine, disinfector, road making, furnishing, &c., of about £4,900, or £272 per bed. The site is an admirable one for a sanatorium, being about a mile out of the town and in an elevated position. It is situated on the east side of Bempton-lane, and is from 131 ft. to 168 ft. above ordnance datum. The aspect of the site is south-westerly, and the subsoil consists of gravel on clay overlying chalk. There is plenty of room for extension, as the adjoining 7-acre field on the east side is the property of the corporation.

The buildings consist of scarlet fever pavilion, ward pavilion, observation block, administration block, laundry and disinfecting block, engine-house, stables, and carriage-house, mortuary, and caretaker's cottage.

The accommodation in both the scarlet fever and ward pavilions is for eight beds, and in the observation block for two beds, or a total accommodation for eighteen beds. The buildings are in red brick, with stone dressings. A proper system of drainage has been carried out, with inspection chambers at every deviation in line, and the drains connect into a 9-in. pipe sewer, which conveys the sewage and surface water into a septic tank. The water supply is from a well 8 ft. diameter and 150 ft. deep, sunk into the chalk. The water is pumped up into an overhead tank which is 7 ft. by 7 ft. by 3 ft. 6 in. in depth, and contains just over 1,000 gallons, or two days' supply for twenty-two persons, allowing 25 gallons per head per day.

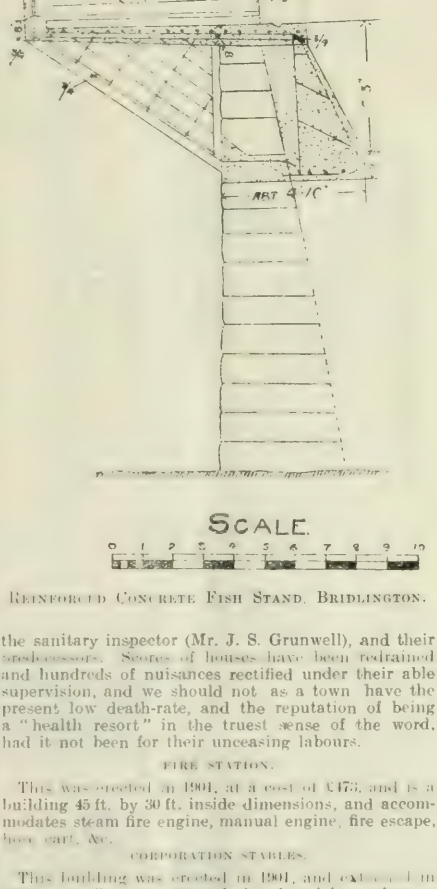
The pumps are worked by one of Crossley's Blake horse power oil engines. From the tank the water flows by gravitation to the various blocks. The wards are heated by hot-air slow-combustion stoves, placed in the centre of the wards. The laundry block is fitted up with wringing machines, stoneware wash troughs, steeping tanks, drying horses, ironing stove, ironing tables, and the usual requisite fittings.

A Thresh steam disinfector is provided in the disinfecting chamber. The present staff consists of a matron, two nurses, wards maid, cook, porter, and laundress.

The Sanitary Committee have recently instructed the author to prepare plans of a new ward block, an extension of the administration block, and the provision of private wards; these improvements he estimates will cost £1,500.

The medical officer of health is also the superintendent of the borough sanatorium.

Sanitary Improvements Generally.—Before leaving the reference to the sanitary improvements carried out in the borough during the past few years the author would not forget to draw your attention to the excellent work in this direction done by his colleagues, the present medical officer of health (Dr. A. K. Jarratt),



Reinforced Concrete Fish Stand, Bridlington.

the sanitary inspector (Mr. J. S. Grunwell), and their predecessors. Scores of houses have been redrained and hundreds of nuisances rectified under their able supervision, and we should not as a town have the present low death-rate, and the reputation of being a "health resort" in the truest sense of the word, had it not been for their unceasing labours.

FIRE STATION.

This was erected in 1901, at a cost of £473, and is a building 45 ft. by 30 ft. inside dimensions, and accommodates steam fire engine, manual engine, fire escape, hose cart, &c.

CORPORATION STABLES.

This building was erected in 1901, and extended in 1906, and affords accommodation for eighteen horses, the cost of the building, including extension, being £1,026.

PUBLIC NURSERIES.

These are situated off Quay-road, and adjoining the [illegible] depot, and [illegible] about 1½ acres. The building consists of five greenhouses and a large palm-house, with a great number of cold frames. It is interesting to know that during the past year (1911)

* "Erosion on the Holderness Coast of Yorkshire," by E. R. Matthews ("Minutes of Proceedings," Institution of Civil Engineers, 1910).

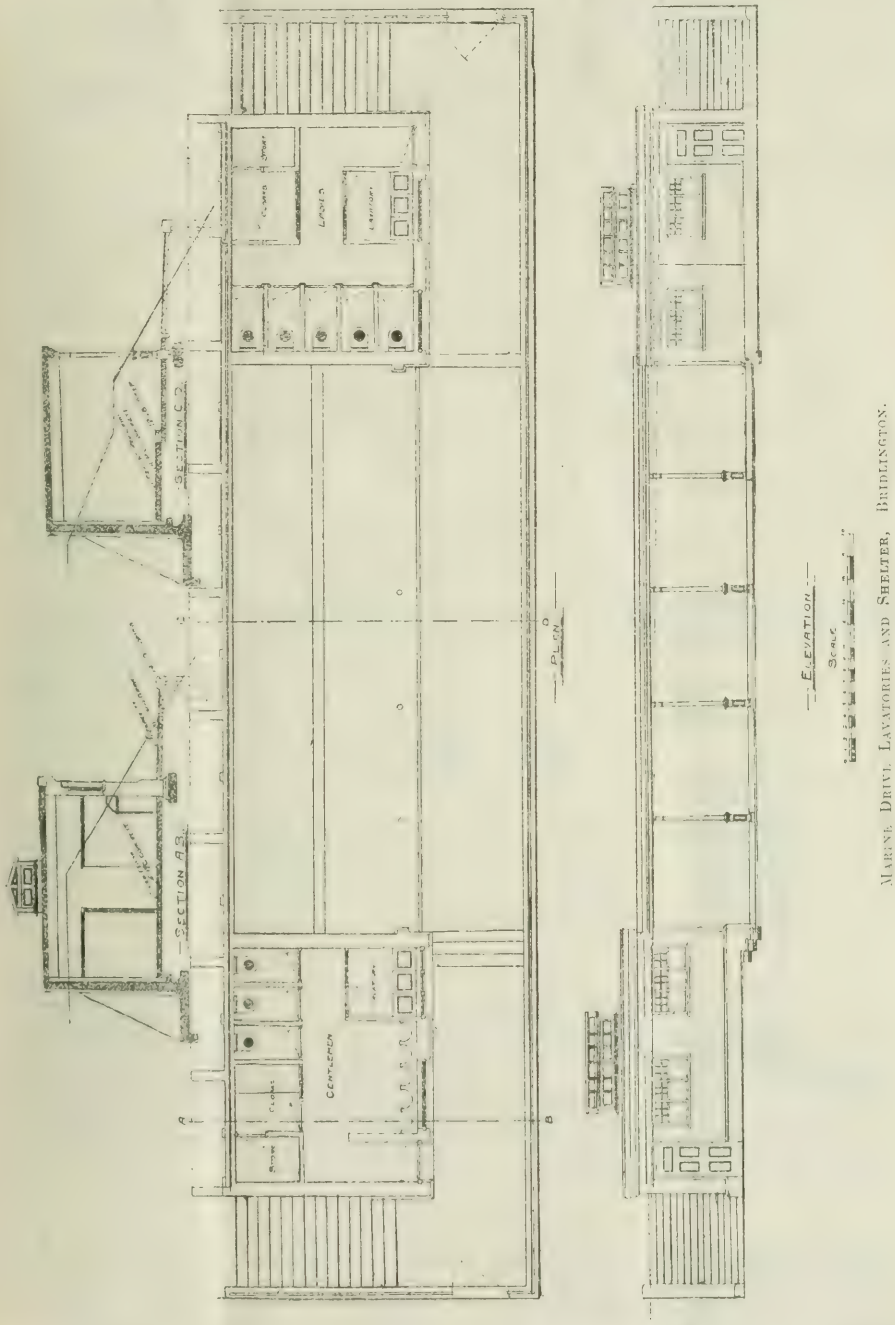
Section on Line A A

Bridlington Electricity W[illegible]

no less than 100,000 plants were here propagated for use on the Royal Prince's-parade, in the various public gardens, and also for decorating purposes, such as mayoral receptions.

The meteorological observations are here taken by Mr. Crofts, and reports are sent daily to various newspapers throughout the country.



MARINE DRIVE LAVATORIES AND SHELTER, BRIDLINGTON.
(Plate 6.

PUBLIC GARDENS.

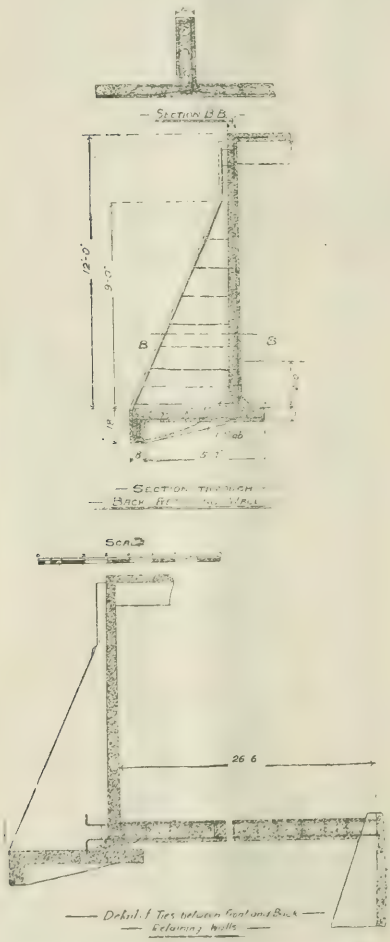
Whenever an opportunity has occurred for obtaining land at a moderate rate for the purpose of beautifying the town by laying out public gardens, the Property Committee of this corporation have been alert, and land has been purchased, the result being that during the past few years the Beaconsfield Gardens, South Cliff Gardens, Pembroke Gardens, Victoria Gardens, Windsor Crescent Gardens, and Vernon Gardens have been laid out and transformed by the skill of our able superintendent of public gardens, Mr. S. R. Crofts (to whom we are indebted to-day for the floral decorations in this building in which we are met), from barren wastes to places of beauty. In connection with the South Cliff Gardens four kiosks and a large colonnade have been erected.

and in the Pembroke Gardens an ornamental shelter has been built.

ELECTRICITY WORKS (Fig. 5).

An Electric Lighting Provisional Order was obtained in 1900. In 1902 it was resolved to proceed with the works. The late Mr. F. H. Medhurst, B.SC., M.I.E.E., of Westminster, was appointed the consulting electrical engineer, and he prepared the scheme, the author designing the buildings, the latter costing £5,562. The sanction of the Local Government Board was obtained to the borrowing of £26,481; this was received early in 1904. In 1906 an additional sum of £8,138 was borrowed, this being for the laying of additional cables, putting in of additional plant, meters, &c.

The charge for street lighting per annum is about £2,504, all the public lighting being by electricity, a thing which occurs in few towns. For private consumption the charge is 5d. per unit up to 500 units



MARINE DRIVE LAVATORIES AND SHELTER. BRIDLINGTON.

(Plate 6.)

per quarter; exceeding 500 and not exceeding 750, 4½d. per unit; exceeding 750 and not exceeding 1,000, 4d. per unit; from 1,000 to 1,500 units per quarter, 3½d.; above this, 3½d. For power and heating, not exceeding 250 units per quarter, 2d.; from 251 to 500 units per quarter, 1½d.; above 500 units per quarter, 1½d. The demand for private lighting purposes, power, public lighting, &c., is equivalent to 34,582 8-candle power lamps. There are now 565 consumers against 300 four years ago. For public lighting there are 54 arc lamps and a number of metallic filament lamps; capacity of plant, 750 kilowatts; maximum load recorded in 1911, 407 kilowatts; total connections to main, 1,037 kilowatts.

From time to time since 1906 further extensions and improvements of the plant have been effected under the able supervision of the borough electrical engineer (Mr. A. J. Beckett), who has designed these.

PUBLIC CONVENIENCES.

During the past few years several public conveniences have been erected within the borough—namely, those in South Cliff-road, Marine Drive, St. John-street, and the Beaconsfield lavatories on the sea front. One of these is illustrated in Fig. 6. There is nothing special about them apart from the fact that reinforced concrete was used largely in their construction.

HOUSING AND TOWN PLANNING SCHEMES.

The Town Council are now considering a scheme for the erection of a number of workmen's dwellings in the old town portion of the borough. These are very much required, owing to the extensive demolition of properties in that part of the town during the past few years for street widening purposes.

A town planning scheme is also being considered by the council, and it might be mentioned that the area which is to be included in this scheme comprises a large portion of the rural district in the vicinity of Bridlington.

EXTENSION OF CEMETERY.

Application has recently been made to the Local Government Board for a loan of £500 for the purpose of extending the borough cemetery in a southerly direction; 1,700 additional grave spaces will be available. The area proposed to be taken in is 1½ acres, and this work it is hoped will be completed in the autumn.

TREES.

There are in the streets of Bridlington 1,017 trees. The varieties best suited for this exposed district are the elm (*Ulmus Campestris*), plane (*Platanus Acerifolia*), service (*Pyrus Sorbus*), sycamore (*Acer pseuda platanus*), and the mountain ash (*Pyrus Americana*). Average cost of planting a tree, including purchase of same, excavating, cartage, &c., 5s. to 6s. Cost of perforated-iron grate, when used, 5s. 3d.—this is placed level with the asphalt, and allows the rain and air to get down to the roots of the tree. The method we find most suitable is to purchase the trees as saplings, about 4 ft. to 5 ft. high, at about 30s. per 100, and grow them in the nursery for five or six years, when they are ready for the streets. By this method they become thoroughly hardened to the district, and grow much more freely than when brought from a distant nursery and planted in the streets forthwith.

USE OF REINFORCED CONCRETE.

This interesting material has been used by the author very considerably in Bridlington, but chiefly in the construction of retaining walls, roofs (slabs and beams), foundations and steps.

Particulars of its use in several works are now given.

BEACONSFIELD LAVATORIES.

A brief description of the reinforced concrete work in connection with these new lavatories is as follows:

*Concrete.** The concrete used was in the proportions of 1:2:3—namely, one part Portland cement capable of passing the standard tests, two parts clean sharp sand, and three parts sea gravel, capable of passing through a 1-in. ring.

Steel.—This had to be of British manufacture, and capable of withstanding a tensile stress of 60,000 lb. per square inch. No reinforcement was allowed to come nearer than 1 in. to the face of the concrete.

Shuttering.—This was substantial, and, for the retaining walls, was formed chiefly out of 7-in. by 3-in. deals and 1¼-in. boarding.

DIMENSIONS OF RETAINING WALLS.

Length	47 ft.
Height above bottom of foundations ...	12 ft. 6 in.
Width of foundations	4 ft.
Thickness of foundations	7 in.
Thickness of walls ...	5 in.
Width of counterforts	2 ft. 9 in.
Thickness of counterforts	7 in.

DIMENSIONS OF REINFORCED CONCRETE BEAMS.

10 in. by 8 in. (longest clear span, 13 ft. 6 in.)

Thickness of reinforced concrete slabs ... 5 in.

Roof Covering. This consisted of 1½ in. of Limmer asphalt, put on in two layers. The cost of the rein-

* "Reinforced Concrete Retaining Walls," by E. R. Matthews (Trans. Soc. of Engrs., August, 1910). *Concrete and Constructional Engineering.*

forced concrete work and Limmer asphalting was £293 2s. 5d.; the estimated cost of monolithic concrete walls and asphalting was £368, saving 20 per cent. "The forms were removed after they had been up four weeks. The roof is in every way watertight, and the walls present a smooth and uniform face. The combined live and dead load allowed for was 2 cwt. per square foot. The period for which the Local Government Board granted the loan was twenty-seven years.

A retaining wall of less height and lighter section was built in front of the lavatories, but as this is of similar design to the back wall, the author will not describe it.

Steps.—Two flights of steps, each 8 ft. in width, were also constructed in this material. The work was carried out by the Trussed Concrete Steel Company under their Kahn system, and the length of loan obtained was thirty years.

St. Johnstreet Lavatories. The roof of these lava-

BEACONSFIELD LAVATORIES, BRIDLINGTON.

MARINE-DRIVE LAVATORIES AND SHELTER (See Fig. 6).

RETAINING WALLS.

Height of back retaining wall (average)	12 ft.
Thickness to foundation slab	7 in. (base) 4 in. (top)
	6 ft. wide.
	7 in. thick

and strengthened by an inverted reinforced concrete beam, 18 in. by 8 in.

Buttresses, 10 in. in thickness and (average) 10 ft. apart.

Roof slab, 4 in. in thickness, supported by 12 in. by 8 in. reinforced concrete beams.

tories was constructed in this material, and consisted of a 4-in. slab, 6-in. by 4-in. lintels carrying the lantern lights.

REINFORCED CONCRETE FISH-STAND.

This is a small but very interesting piece of reinforced concrete work, and is briefly described as follows:

It consists of a cantilever platform, carried by reinforced concrete brackets, which are 5 in. in thickness, spaced at 6-ft. 2-in. centres, and of 4 to 1 concrete. The platform varies from 4 in. to 8 in. in thickness,

is 50 ft. in length, and the over-all measurement as to width is 9 ft. 6 in. "The reinforcement consists of ½-in., ⅞-in., and ¾-in. rods, with special clips and stirrups, and the work was carried out by the Chain Concrete Syndicate of Leeds, their price being £114 12s. 6d., but this did not include the excavation and the cost of the iron railings. The work was completed in December, 1910, and a test load of 2 cwt. per square foot was applied." *

The author has recommended the council to construct a continuous shelter on the sea front in this material.

TOWN HALL.

In conclusion, the author would say—and he is sure that you will agree with him—that, having provided so admirably for the accommodation of the visitors, it is now quite time that the corporation began to consider the desirability of providing for its own proper accommodation, and erecting a town hall worthy of this up-to-date and progressive borough. By so doing the officials would be able to discharge their duties with much less inconvenience than at present; and while the author does not say that the work would be done any better, he does consider that it would be done more expeditiously.

However, this matter, he has no doubt, will receive their consideration at no very far distant date.

From the foregoing *résumé* of the sanitary and other works which have been carried out during recent years at Bridlington, the author thinks that you will agree with him that the town council's policy has been a progressive one, and that they have moved with the times; and he is sure of this, that if they continue to do so there will be little fear of the popularity of this charming health resort waning. Dr. Johnson used to say, "The business of life is to go forward." The author thinks it might be said that the Bridlington Town Council have realised the truth of that statement, and have tried to act up to it.

He hopes that the next time the institution visit us we shall be able to show you our new town hall, workmen's dwellings, municipal common lodging-house, and last, but not least, our refuse destructor.

He would like to acknowledge the valuable assistance of his deputy, Mr. J. S. Hunt, and of his staff in the designing and carrying out of the various works referred to in this paper.

MAYOR'S WELCOME TO MEMBERS.

Saturday's meeting at Bridlington was held at the town hall, where the members on assembling were received by the mayor (Alderman L. Mainprize, J.P.), who said it was his duty and also his pleasure to offer the institution a very sincere and hearty welcome to Bridlington. They had a winter population of about 15,000, but they nevertheless claimed to be a very progressive town, and during the past forty-six years they had borrowed and spent about £380,000 in the carrying out of various improvements and works. Of that amount he was pleased to say they had already repaid about one-third, with the result that to-day their liability, including poor and education rates, the total rates, amounted to only 6s. 4d. in the £. He knew of few towns that had spent so much and had such a small rate as they had in bright, breezy Bridlington. He was glad to welcome them that day, and hoped they would make their stay in the town as long as possible.

The President said it was with peculiar pleasure that he found himself occupying the chair that morning. His knowledge of Bridlington extended over something like twenty years. For about fourteen years he had spent his holidays in their delightful town, and he had watched the very great improvements which had been made by the authorities. There was a time many years ago when the town did not progress as well as it ought to have done, but of late years the corporation had done its best to cater for not only the townspeople, but for the visitors to the town. He had seen from time to time the works which the energetic borough engineer, Mr. Matthews, had designed and carried out, and he had done well in supporting the council in all they had undertaken. They had been accorded that day a true Yorkshire welcome, and he hoped that the meeting would prove of service not only to the members of the institution, but to the town which they were visiting that day.

Owing to pressure on our space we are unavoidably compelled to hold over until next week the report of the discussion which followed the presentation of Mr. Matthews' and Councillor Charlesworth's papers.

* "Reinforced Concrete Construction in Theory and Practice," by Prof. Hy. Adams and E. R. Matthews. (Longmans.)

NEW AND IMPROVED METAL LATHING FOR PLASTER-WORK.

We call special attention to the interesting announcement which appears among our advertisements (p. xviii.), stating that the Expanded Metal Company, Limited, of York Mansion, York-street, Westminster, London, S.W., and Stranton Works, West Hartlepool, have succeeded in producing a new and improved diamond mesh expanded metal lathing which will be obtainable at prices lower than those for the original expanded metal lathings.

The new lathing is made under a recently patented process. It will be known by the trade name of "BB Expanded Metal" Lathing, and the illustration shows the actual size of its meshes. It is made in standard size sheets, 9 ft. long way of mesh by 2 ft. short way of mesh, which is an increase of 1 ft. in length as compared with the original lathings.

"BB Expanded Metal" Lathing has several important advantages over the original expanded metal lathings. First and foremost, its cost is less; then it may be used at wider spacings, and it requires less plaster.

Several practical tests have been made under ordinary working conditions by well-known expert plasterers, who have used many thousands of yards of the original lathings, and their reports all agree that not only is the new lathing stronger and stiffer than the original lathings, but that, on account of the reduced size of the diamond mesh, together with the improved slope of its strands, less plaster goes through to form the "key," and practically none falls off and is wasted.

"BB Expanded Metal" Lathing is now ready for the market, and as it is sold through the merchant trade only, stocks will be held in most large centres. It is listed in three gauges, thus: BB 26-gauge expanded metal lathing; BB 24-gauge expanded metal lathing; BB 22-gauge expanded metal lathing

Reference to the price list issued by the Expanded Metal Company, Limited, shows that, gauge for gauge, a saving of from 25 per cent to 60 per cent is made by substituting the new lathings for the old. But the saving in cost is really more than the difference between the price list rates for equivalent gauges, because of the wider spacings that may be used with the new lathings. To take one gauge only, in the original lathing, No. 1, 24-gauge is not recommended for spacings over 12 in., whereas "B" 24-gauge may be used for spacings up to 15 in. in ordinary horizontal or sloping work, and up to 18 in. in ordinary vertical work.

Tests have been made at these spacings with entirely satisfactory results, both with ordinary lime and hair mortar and with special quick-setting plaster, and these facts should produce a ready and large sale for the new lathing.

Drainage Works and Sanitary Fittings.—A third edition, revised and brought up to date, particularly as regards the questions of concrete sewers, sewer ventilation and flushing, and the Public Health Acts Amendment Act of 1907, still further evidences the success of this little manual,* which manifestly deserves the attention and confidence of all concerned in the important subject with which it deals.—*The Bookseller.*

Aberdeen Water Supply.—An important report on the water supply of Aberdeen has been issued by the engineers, Mr. C. H. Roberts and Mr. C. P. Hogg, Glasgow. The city, they report, is using 41 gallons of water per head per day, and they estimate that a satisfactory extended supply can be obtained from the Dee of an average of 10 000,000 gallons a day for £511,600. Other charges bring up the total to £557,410, with an additional £35,000 for a reservoir if compensation water is required. The engineers also report on Glen Dye as a suitable source of supply. The river Dye is 14 miles long, and the gathering ground is bare of human habitations. A large part of the area is owned by Sir John R. Gladstone, Bart., of Fasque and used as a deer forest. There is an excellent site for a reservoir, and the water has been shown to be of excellent quality for domestic and trade purposes. A supply of 10 000,000 gallons daily could be obtained from this source for £508,000. The engineers recommend the second scheme, and urge that the work should be commenced without delay.

Third International Road Congress.

LONDON, 23rd TO 28th JUNE, 1913.

On the invitation of the Government of the United Kingdom of Great Britain and Ireland, the Third International Road Congress will be held in London, in 1913, in order to continue the studies, begun in Paris in 1908, regarding the construction and maintenance of roads in view of modern methods of locomotion. This congress, at which the Governments of the different States have been invited to be officially represented, will open on June 23rd and will last six days.

PROGRAMME OF QUESTIONS.

First Section—Construction and Maintenance.
Sub-section A—Construction and maintenance of roads outside towns.
Sub-section B—Construction and maintenance of roads in towns.
Sub-sections A and B sitting together—Questions common to both.
Second Section—Traffic and Administration.
Sub-section C—Traffic and vehicles.
Sub-section D—Administration, finance and statistics.
Sub-sections C and D sitting together—Questions common to both.

1st Section.

CONSTRUCTION AND MAINTENANCE.

Questions common to Sub-sections A and B.

1st Question—Planning of New Streets and Roads.
(*a*) Old towns: 1, in central districts; 2, in the suburbs.
(*b*) In new towns.
(*c*) In the rural areas.

Importance of directness of route—Alignment—Longitudinal and cross sections—Curves—Analysis of practical and economic value of width under various circumstances—Steps necessary to ensure the security of and regularity of the various currents of circulation—Whether local or through traffic—Reconciliation of requirements of each of the former—By-pass roads avoiding towns and villages—Treatment of crossings and corners—Arrangement of metalled carriageways, footpaths, special tracks, taking into account the presence or absence of tramways, of bicyclists, and of the various methods of circulation generally in use.

2nd Question—Types of Surfacing to be adopted on Bridges, Viaducts, &c. (fixed or movable bridges, suspension bridges, railway bridges).

Cost—Wear—Durability of various surfacings—Methods of maintenance and repair, of remaking.

Communications common to Sub-sections A and B.

Communication 1—Improvements adopted since the Second Congress in Machinery Used in the Construction and Maintenance of Macadamised Roads.

Sweepers—Watercarts—Machine rammers—Light rollers—Mixers—Stone driers and heaters—Transport wagons.

Communication 2—Tests of Materials Used in the Construction of Macadamised Roads.

Laboratory and practical tests—Testing machines and appliances—Comparative value of various tests—Statistics of results obtained.

Sub-section A.

3rd Question—Construction of Macadamised Roads—Bound with Tarry, Bituminous, or Asphaltic Materials.

Which are the best methods and materials for the construction in open country of macadamised roads bound with tarry, bituminous, or asphaltic materials?

NOTE.—Reports sent in under this heading must include all or some of the following heads, and furnish, as much as possible, data obtained from practical experience, and more especially on the results obtained in the various trials that have taken place since the Second Congress.

1. Foundations and drainage.
2. Sizes and shapes of broken stone for bituminous-bound surface crust.
3. Use of partially-worn materials in bituminous-bound surface crust.
4. Thickness and composition of the strength crust and of the super or wearing crust under different conditions.
5. Life of surface crust under different conditions of traffic, weather, subsoil, &c.
6. Relative importance of patching, repairs, and periodical renewals of surface crust.
7. Extent of wear permissible before renewal of surface coating.
8. Measurement of wear and appliances used for this purpose.
9. Various methods of bituminous treatment
   (*a*) Mixing methods: 1, in factories, 2, on the spot.
   (*b*) Grouting methods.
   (*c*) Carpeting methods.
   (*d*) Other methods.
10. Relative advantages and use of tar, tarry compounds, asphalt, bitumen, and other materials.
11. Tests and chemical analysis of tarry, bituminous, and asphaltic compounds.
12. Climatic effects causing slipperiness of the roadway—Remedies.
13. Effect on public health, fish life, or vegetation.
14. Specification of the methods of construction.
15. Cost data.
16. Cleansing and watering.

Communication 3—Construction of Water-bound Macadamised Roads.

Which are the best methods of construction and maintenance for water-bound macadamised roads, used in country or suburban districts since the second congress?

NOTE.—Reports sent in under this heading must include all or some of the following heads, and furnish, as far as possible, data obtained from practical experience.

1. Foundations and drainage.
2. Choice of materials.
3. Sizes and shapes of broken stone and of chippings.
4. Use of partially worn materials in the formation of the surface crust.
5. Thickness and composition of the strength crust under different conditions.
6. Life of the surface crust under different conditions of traffic, weather, subsoil, &c.
7. Relative importance of patching repairs and periodical renewals.—Methods of resurfacing.
8. Specifications of the methods of construction.
9. Cost data.
10. Cleansing and watering.

Communication 4—Technical and Economic Study of the Comparative Advantages of Different Types of Roads.

Under what circumstances and conditions of traffic are the following types of road preferable from the point of view of the traffic and from that of economy?

1. Stone setts.
2. Metalled roads, bound with tar, pitch, asphalt or bitumen by
   (*a*) Mixing or grouting methods.
   (*b*) Carpeting methods.
   (*c*) Other methods.
3. Metalled roads—Water-bound.

Sub-section B.

4th Question—Wood Paving.

Choice of wood—Methods in use—Resistance to wear—Methods of maintenance—Cost—Cleansing and watering.

Communication 5—Various Types of Stone Paving in use.

Advantages of unification.

2nd Section.

TRAFFIC AND ADMINISTRATION.

Questions in common to Sub-sections C and D.

5th Question—Methods of Lighting.
(*a*) The public highway.
(*b*) Vehicles.

Sub-section C.

6th Question—Observations noted since 1908 as to the various causes of Wear and of Deterioration of Roadways.

1. In towns.
2. In suburban districts.
3. In open country.

Effects produced by sun, frost, snow, or any varia-

tions of temperature—Effects due to the circulation of self-propelled and horse-drawn vehicles—Mixture of fast and slow traffic, aggregate volume and density in busy hours—Effect of speed, weight, construction, position of the exhaust, width and diameter of wheels, various kinds of tyres, shoeing of horses.

7th Question—Regulations for Fast and Slow Traffic on Roads.

Conditions to be observed with a view to the safety of the public—Precautions to be taken during progress of repairs—Regulations for the use of the roads during frost and thaw—Positions of lamp-posts and other obstructions.

Communication 6—Direction and Distance Sign-Posts.

Communication 7—Development since the Second Congress of Self-propelled Public Service Vehicles.

Dimensions—Weight Capacity—Cost of upkeep—Mileage worked.

Sub-section D.

8th Question—Authorities in Charge of the Construction and Maintenance of Roads, Functions of Central Authorities and Local Authorities.

Advantages and disadvantages of centralisation and decentralisation—Area and organisation for construction, maintenance, repairs—Staff employed, its composition and whence drawn—Systems of inspection.

9th Question—Finance of the Construction and Upkeep of Roads. Provision of Revenues.

Special taxes—on what classes of persons, vehicles, or objects would the taxes weigh? bases on which the incidence of taxation should be founded—Borrowing for road construction and renewals—Methods of repayment.

Communication 8—Qualifications of Engineers and Surveyors in Charge of the Construction and Maintenance of Roads. Wages and Conditions of Service of Foremen and Roadmen.

Communication 9—Statistics of Cost of Construction and Maintenance.

Methods of keeping accounts—Repartition among the various authorities, boards, &c., interested—Comparative statistics per unit of population, mileage, traffic, &c.

Communication 10—Terminology adopted or to be adopted in each Country relating to Road Construction and Maintenance.

CONGRESS PROGRAMME.

Monday, June 23rd.

9 a.m. to 6 p.m.—Registration of members at the Surveyors' Institution, Great George-street, Westminster. Issue of membership cards, badges, invitations, tickets, programmes, &c.

10 a.m.—Meeting of the Permanent International Commission of the Road Congress at the Institution of Mechanical Engineers, Storey's Gate, Westminster. Consideration of the report of the Permanent Council.

11.30 a.m.—Meeting of the Permanent Council, appointment of General Committee and Sectional Committee and officers of the Third Congress.

2.30 p.m.—Opening meeting of the Congress. The honorary president of the Congress, the Right Hon. the Chancellor of the Exchequer, in the chair.

Opening address by the Right Hon. the Chancellor of the Exchequer.

Address by the chairman of the Organising Council, Sir George S. Gibb.

Address by president of the Permanent International Association.

Replies by delegates of Foreign Governments.

5.15 p.m.—Reception of members of the Congress at the Road Exhibition at the Royal Horticultural Hall, Vincent-square, Victoria-street, S.W., by the president of the Exhibition Committee, the Right Hon. Earl Beauchamp, H.M. First Commissioner of Works.

Afternoon tea and music.

7.45 p.m.—Reception and conversazione at the Guildhall, City of London. Members of the Congress will be received by the Lord Mayor and Corporation of the City of London at the Guildhall, City.

Tuesday, June 24th.

10 a.m.—Meetings of the sections for the consideration of papers and reports.

1st Section. Sub-sections A and B combined, at the Institution of Civil Engineers, Great George-street, S.W.

Question 1.

2nd Section. Sub-sections C and D combined, at the Institution of Mechanical Engineers, Storey's Gate, S.W.

Question 5.

3 p.m.—1st Section. Sub-sections A and B combined, at the Institution of Civil Engineers, Great George-street, S.W.

Question 2 and Communications 1 and 2.

2nd Section. Sub-section C, at the Institution of Mechanical Engineers, Storey's Gate, S.W.

Question 6.

Sub-section D, at the Surveyors' Institution, Great George-street, S.W.

Question 8.

Wednesday, June 25th.

10 a.m. and 3 p.m.—Meetings of the Sections for the consideration of papers and reports.

1st Section. Sub-section A, at the Institution of Civil Engineers, Great George-street, S.W.

Question 3 at 10 a.m.

Communications 3 and 4 at 3 p.m.

Sub-section B, at the Surveyors' Institution, Great George-street, S.W.

Question 4 at 10 a.m.

Communication 5 at 3 p.m.

2nd Section. Sub-section C, at the Institution of Mechanical Engineers, Storey's Gate, S.W.

Question 7 at 10 a.m.

Communcations 6 and 7 at 3 p.m.

Sub-section D, at the Surveyors' Institution, Great George-street, S.W.

Question 9 at 10 a.m.

Communications 8, 9 and 10 at 3 p.m.

9 p.m.—Reception by the Institution of Civil Engineers at the Albert Hall, or the new premises of the institution (if completed) in Great George-street, S.W.

Thursday, June 26th.

Group "A."—Inspection of roads in Surrey, Middlesex, Berkshire, Buckinghamshire, Hertfordshire and Essex, in motor cars provided by members of the Royal Automobile Club, and organised by the committee of the club. This group, which will be limited in number, will be divided into parties which will make inspections under the guidance of a leader assisted by gentlemen able to act as interpreters. (Number limited.)

Group "B."—Visit to Windsor Castle, on the gracious invitation of H.M. the King, to afternoon tea.

A special train will leave Paddington Station about 2 p.m., returning from Windsor about 6 p.m. (Limited to 1,000 members.)

Group "C."—River Party.—A special train will leave Paddington Station about 10 a.m. for Henley, and a launch will be provided to enable the members of the party to see one of the prettiest reaches of the river Thames, from Henley to Goring and back. Lunch and tea will be provided on the launch. Return train from Henley about 5 p.m. (Limited to 150 members.)

9 p.m.—Reception of the members of the Congress at the Royal Automobile Club by the chairman, the Hon. Arthur Stanley, M.P., and the committee of the club.

Friday, June 27th.

10 a.m.—Meeting of the Permanent Council.

10 a.m.—Further meetings of the Sections which have not completed their business.

2.30 p.m. Final meeting of the Congress at the

Institution of Civil Engineers, Great George-street, S.W.

3 p.m. to 7 p.m.—Garden party, given by the president, council and members of the Surveyors' Institution. (Number limited.)

Visit of the members of the Congress to representative London theatres:—

(1) Drama.—His Majesty's Theatre, limited to 276 seats in the dress circle.

(2) Musical Comedy.—The Gaiety Theatre, limited to 168 seats in the dress circle.

(3) Variety Entertainment.—The Coliseum, limited to 979 seats in the stalls and dress circle.

Saturday, June 28th.

Group "A."—Programme to be arranged by the Automobile Association and Motor Union.

Group "B."—Inspection of roads in Kent, including the section on which tests of road materials have been made at Sidcup. The members will be divided into parties which will make inspections under the guidance of a leader assisted by gentlemen able to act as interpreters. (Number limited.)

Group "C."—Visit to Garden City at Letchworth.

Group "D."—Visit to the National Physical Laboratory at Bushey, and to Hampton Court Palace.

7.30 p.m.—Banquet at the Hotel Cecil.

SPECIAL INSPECTIONS AND EXCURSIONS.

June 30th to July 5th.

A programme will be arranged for the week following the Congress of visits and inspections to places of interest, quarries, engineering workshops and roads in West of England, the Midlands, North Wales and Scotland, of which announcements will be made at a later date.

EXHIBITION.

An exhibition of road materials and machinery will be held at the Royal Horticultural Society's Hall and in adjacent ground during the session of the Congress. The Royal Horticultural Society's Hall is situated in Vincent-square, Victoria-street, S.W., and is about five minutes' walk from the halls of the institutions in which the sectional meetings are held.

W. REES JEFFREYS,
Hon. General Secretary.

Queen Anne's Chambers,
Westminster, S.W.

Town Planning in Sussex.—A motion has been carried at this week's meeting of the Shoreham Urban District Council affirming that at a meeting to be held on a date not earlier than two months from July 2nd the council will consider a resolution empowering them to make application to the Local Government Board for authority to prepare a town planning scheme for the district.

Municipal Work at Wednesbury.—It is the intention of the Wednesbury Electricity Committee shortly to bring forward a new scheme for making electricity extensions on a new site, which will be on the canal or railway, or both, although the present station will be useful for stores, offices, and for generating purposes. With respect to the proposed extensions of the municipal buildings and public baths, it has been necessary to ask for £6,000 instead of £5,000, owing chiefly to the increased cost of materials.

Municipal Engineers and Town Planning.—From an editorial article in the *Contract Record* of Canada we quote the following: "It would seem that the first popular belief to be overcome is that city planning schemes mean the hiring of a number of artists to make the city 'beautiful'; that under such enterprises the city will be bankrupted, industry hampered, and old landmarks destroyed. These ideas are most delusive. City planning, to be successful, must be the work of several experts, each skilled in his special line. The city engineer should take a more important part in this field. It is difficult to understand why this is not more appreciated when it is considered that city planning involves so many engineering works with which the municipal engineer is so prominently identified. We are inclined to think that this has been due rather to lack of appreciation on the part of the public than to lack of initiative on the part of the engineer. Certain it is that city planning will never meet with a fair measure of success in Canada until the municipal engineers throughout the country are enrolled in the work."

CORRESPONDENCE.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesie."
— GEO. HERBERT, "*The Temple*."

THE WORK OF ROAD SURVEYORS.

To the Editor of THE SURVEYOR.

SIR,—I detest to repeat myself, and I did hope that my letter which appeared in your issue of October 29th, 1909, would have caused some of our do-as-others-say road repairers in the North to try and think out the problem, Why. In that letter I thoroughly condemned 3 in. broken stone for macadam, tar grouted or otherwise grouted roads. The Great North Road one has heard so much about, and which so many have visited, is still being repaired with 3 in. hand and machine broken stone, between Berwick and Newcastle. Many other roads are being treated likewise, while the only reason for this must be Mr. So-and-So recommends it. Near Berwick I found them, after tarring the stone, grouting it with engine ashes; or was this intended as a binder? Is there any wonder at the present state of the rocky road to Berwick from Newcastle?

Why do our road surveyors continue this impossible smooth road method? Is it because Macadam did otherwise, and I have so often and so long condemned it? I have never seen a failure of all stone of 1½ in. and ½ in. material; one road I see daily has been down six years, a water-bound all-stone road, and it still remains a smooth road to walk or drive over. The Thames Embankment demonstrated that 1½ in. was better than 2½ in., for the larger the stone the more muck in all or any form (ashes included) is required, the latter the worst material that can be used.

Taking the whole country generally, one continually comes across samples of broken stone, or a large proportion equally as bad as was condemned thirty years ago by the then practical road surveyors (not boys from school). Why do our present so-called road makers accept chippings, and chipping shaped unangular, material such as can be often seen on our road sides, when stone can be broken by the latest and best machinery, better and more uniformly in size than by present-day hand-breaking?

The country, our towns and counties, are not being governed: they are drifting as the water drifts into the sea, and the brains of the population are doing likewise, for Acts of Parliament are making it more difficult year by year for practical men to rise to superior positions and become employers instead of employed. There are fewer practical experienced employers and supervisors, and when the practical experienced man finds it impossible to step upwards, we only drift all the faster into the depths, like the water to the sea. Our roads suffer as well as mankind, for what is everyone's duty becomes no one's duty, not even to think how to improve one's self: hence we are relying more and more on Acts of Parliament to remedy every evil. If, however, we preserved and used our brains, we should realise that all things necessary for the good of mankind must come from the individual, good roads included. Once more I say think, and if men in position of supervisors of our roads cannot or will not think, let them make room for someone else who can and will think out the problem why roads become bumpy, full of holes, and wear irregularly almost as soon as the road-roller leaves the surface, and why some roads last for years and do not wear into holes.

Why can some men reduce costs 75 per cent and have better roads, and others increase cost 100 per cent and have worse roads? Once again, large stone, with or without muck to bind it, never can nor ever did make a lasting smooth road surface that would wear smooth, not even a large sett-paved road on concrete, for the larger the setts, more concussive the road becomes, and as 3 in. setts make better roads than 6 in. setts, so would 1½ in. setts make better roads than 3 in. setts, and so does 1½ in. macadam make better, smoother, and more durable roads than 2½ in. or 3 in. macadam. Then do as Macadam did, who used his brains 100 years ago, and which I have seen wherever 1½ in. has been used ever since 1881. If such a road was, as soon as thoroughly consolidated, tarred and coated with ⅜ in. sharp angular broken material, free from dust, once a year, not soft sand, as used by those who will not think, not soft sand, which, with tar after rain, works up into slurry and is gone, few other systems would be more economical,

This I first recommended to Dr. Guglielminetti at Monte Carlo more than nine years ago, and its value has been proved by Mr. Prescott of Eastbourne, during his surveyorship there.

Some ask what is 1½ in.? It is broken stone, good, sharp angular material, free from chippings, which has passed through holes in an horizontal screen with 1¾ in. round holes, or a declining screen with 2 in. holes. Try it grouted with a good covering of ¼ in. free from dust. Do not sprinkle it after a larger portion of muck has been used, as I see done in the West Riding of Yorkshire, but cover it, using nothing else except it be tar and not less than 20 per cent to 80 per cent of 1½ in., and it cannot fail, either as a water-bound stone road or a tar macadam or tar grouted road, when the under foundation surface is first coated with tar. Here we get the surest preventive against failure: hence the Gladwell and Rocmac systems of first sealing the prepared foundation by giving it a coating of fine prepared waterproofing material to bed the broken stone into, and not using muck.

Why do rocky roads continue? We are getting rid of them in Leeds by tarring the prepared foundation and using not larger than 1½ in. material (tar macadam) and finished with ¾ in. red, untarred granite. Why not all roads from John o' Groats to Land's End? It is cheaper than muck and stone (or anything softer than stone), and if such a road was tarred and coated with ⅜ in. once a year, what a pleasure it would be to all, users and makers, and why not? My answer is, after thirty years' study, it is want of brains and the power to think and take one's own responsibility, hence such can only do as some one else suggests. If the suggestion is by a man with a title, or letters after his name, it is all right to put the cause of failure, if it proves one, upon him.

First learn how to preserve your brains, then you will have the power to learn how to make and preserve roads. It is simple, but it requires each one to take his own responsibility and make the necessary effort. Some have done it and benefited thereby. Demonstrate ye highway men before the 1913 Road Congress, and do not give any foreigner the chance to say we can teach old England something which its forty years of Government education, school and office trained road-makers have forgotten. The education and training given has been repetition and not practical, something memorised from a book, to pass an examination, to obtain their now altered M.INST.C.E., or some other title. Subsequently the examinee refers to a book, and does as others recommend, instead of solving difficulties by practical experiment and brain effort. This process, like that of Government, of Town and County Councils' procedure, means drifting, not initiating; copying, not creating. Come back to individual action and responsibilities, then rocky roads to anywhere will be roads of the past, as well as many other troubles; nor should I feel it my duty to try to wake up my fellow-Englishmen and fellow-workers in the interests of good road-repairing by having to repeat the proved results of practice and experience. They ought to press such as myself to assist in providing the necessary machinery to do it better every time.—Yours, &c.,

W. H. Baxter.

Leeds, June 20th, 1912.

STANDARDISATION OF ROAD MATERIALS.

To the Editor of The Surveyor.

Sir,—With reference to the Conference on the above subject held on June 21st at the Surveyors' Institution, do we understand that it is the intention of the Committee to standardise or specify any one particular bitumen for road-work? If this is the case it will not only be creating practically a monopoly of the bitumen so specified but it will also put a ban on research work and the experience that any may have had in the manufacture of bitumen, &c.

It would, we consider, be grossly unfair to specify our or any other make of bitumen materials for road construction, and seeing that there are bitumens from various parts of the world that have never yet been used for this particular purpose, and as the length of life of these materials is all-important, might we ask how the committee will decide as to their suitability?

It is agreed by all authorities that bitumen is a natural product, and we only, of course, refer to it as such, and not to those bituminous products obtained as the result of destructive distillation or by other artificial means.

It has also been proved by practical experience that the characteristics of native bitumen are not shared by artificial products, and will these and all other important points be taken into consideration by the committee? With all due respect to the delegates, we do not recognise in the list you give of those present at the meeting the names of very many who are authorities on bitumen.—Yours, &c.,

A. E. H. Dussek (The Dussek Bitumen Co.).

SEWAGE DISTRIBUTORS.

To the Editor of The Surveyor.

Sir, In case there should be any misapprehension on the part of those of your readers who may have been interested in the account of the meeting of the Association of Managers of Sewage Disposal Works at Southall-Norwood which appeared in your issue of the 28th inst., I would like to say that I only touched upon "fixed sprays and revolving sprinklers," and did not refer to travelling distributors as obviously, so far as cost is concerned, they would be more expensive than either of the other types. The reference under "Effect of Spray" as to the number of nozzles being 625 should obviously read "arranged on the *former* principle." Referring to the question of costs, Mr. Watson, the president of the association, whose presence was appreciated by all, gave figures prepared by Mr. Hart, the sewerage engineer of Leeds, showing costs for 1-acre beds at Hampton (£200 18s.), Nuneaton (£202 15s.), Birmingham (£131) and Hanley (£212), and in connection with these I would like to point out that the whole of the figures, except Birmingham, were for *travelling* distributors (and not for revolving sprinklers), some of them being *power driven*.—Yours, &c.,

Reginald Brown.

21 Old Queen-street,
Westminster, S.W.
June 29, 1912.

SYMONS'S METEOROLOGICAL MAGAZINE.

To the Editor of The Surveyor.

Sir,—This small Magazine, which is published post-free at 5s. per annum, gives an account of the meteorological conditions during the preceding month throughout the British Isles, and sets out not only useful information as regards the weather, but, what is more useful to those in charge of sewers, sewage treatment works and water supplies, giving details which are not got in any of the annually published tables. Unfortunately the small circulation of the Magazine does not allow of its being as full as it might be, and it has occurred to me that brother Surveyors and Medical Officers of Health would derive much useful information if the Magazine were more generally procured.—Yours, &c.,

C. H. Cooper, M.INST.C.E.,
Borough Engineer, Wimbledon.

June 28th, 1912.

[From a perusal of a recent issue of the Magazine we feel fully justified in endorsing our correspondent's view as to its merits and his plea for support for it.—Ed. Surveyor.]

Brighton Water Profits. The water undertaking of Brighton shows a profit for the past year of £5,116.

Where Microbes Nest.—On the ground that wood paving becomes sodden and "a veritable nest of microbes," a deputation, headed by Dr. Angus, has asked the Paddington Borough Council to lay down asphalt.

The Growth of Motor Traffic.—The growth of motor traffic in London is shown by figures given by Mr. John Burns on Tuesday. The motor vehicles registered with the London County Council in 1904 numbered 4,941 cars, no "heavy cars," and 3,327 motor cycles; for 1911 the figures were 8,703 cars, 1,069 "heavy cars," and 3,294 motor cycles. The totals from January 1, 1904, to December 31, 1911, reached 18,701 for cars, 3,379 for "heavy cars," and 16,874 for motor cycles, or a grand total for the eight years of 68,945. If the first half of this year equals last year's figures, this grand total must have increased now to over 75,000.

THE DISPOSAL OF NEW YORK'S SEWAGE.

PRELIMINARY REPORT NO. 3.

The third of the preliminary reports issued by the Metropolitan Sewerage Commission of New York deals with the collection and disposal of the sewage of the Jamaica Bay division.

In the previous reports the commission has shown the desirability of separating the City of New York into a number of divisions to facilitate the design of a system of main drainage. It is proposed to deal with the sewage of each district separately, with due regard to the possibility of combination in the future if this is ever required. In the present report plans and sections are given showing the scheme for the Jamaica Bay division. This area includes a thickly settled district in Brooklyn, many separate villages. Parts are strictly rural territory, there are large stretches of salt marshes, and there are also some largely attended day summer resorts, such as Coney Island and Rockaway Beach. It appears that the shores of the bay are now devoted almost exclusively to the uses of a transient summer population, and the waters to sailing, bathing, and the cultivation of shellfish. The shellfish interests are extensive; but, important as they undoubtedly are, it is clearly the intention of the commission to recommend their abandonment. "The future development of the bay will make shellfish culture unsafe from the standpoint of disease."

So far as the commission can foresee, the future of Jamaica Bay will be on the lines proposed by the Jamaica Bay Improvement Commission, an agreement having been entered into between the United States Government and the City of New York for that purpose. Moreover, outline plans have been officially adopted and money appropriated to begin the work. It therefore appears reasonably certain that the shellfish interests will have to go. The proposals involve extensive engineering works, the construction of a substantial and regular shore line, deep, wide channels for ocean-going vessels, and harbour approaches for the entrance at Jamaica inlet. It is also proposed to construct a number of canals on the northern shore, each about 300 ft. to 400 ft. wide, and from 4,500 ft. to 12,000 ft. long, so as to increase the water front. The object of this development is to increase the shipping facilities of New York by providing additional wharves, storehouses, terminal facilities, and space for handling vessels.

On the other hand, the commissioners are of opinion that Coney Island and Rockaway will long remain pleasure resorts, but if the waters are to be kept pure enough for bathing, boating and shellfish culture, it is quite evident that the method of sewage disposal suggested will be insufficient. We are told that the development of the bay for commerce must necessarily exclude its use for pleasure; hence it is difficult to see how such places as Coney Island and Rockaway can continue their existence as pleasure resorts, at any rate in the same degree as they have hitherto existed.

The population of the division was 366,000 in the year 1910, but the scheme brought forward by the commission will provide for a population of 1,415,700 persons.

GENERAL OUTLINE OF SCHEME.

It is proposed to collect the sewage by the separate system as far as possible, while allowance is made for an unavoidable inflow of ground water. Where sewers are designed on the combined system it is proposed to intercept the dry-weather flow only, and to provide storm overflows above the points of interception. Grit chambers and screens will be placed at the storm-water outlets, but reliance will be placed on dilution for the purification of the liquid discharged.

The sewage will be pumped to Barren Island or carried to Jo Cos Marsh, and will be treated at these places before it is discharged into the sea. As to the purification works, little is said. We are told that the degree of purification required is unknown at this time, but that a rough computation indicates that if all the sewage which would naturally drain to Jamaica Bay by the year 1960 were thoroughly diffused therein, the sewage would, under ordinary conditions, be diluted by about 147 volumes of water at times of low tide. This would be about six to seven times the amount of theoretical dilution required to provide sufficient oxygen to digest the organic matter during the summer months, the most unfavourable of the year. As this ideal condition, however, cannot be relied on, treatment to remove the grosser solids and a certain amount of the dissolved impurities must be ultimately provided. Thus for estimating purposes it is assumed that sewage will have to be treated in settling tanks, and that the tank liquid will be treated in sprinkling filters and settling basins. With regard to the sludge difficulty—the crux of all works of this kind—we are informed that "the inoffensive sludge from the settling tanks can be used for many years to fill in marsh land near the plant," or, "if preferred, it can be dumped at sea."

The total estimated cost of construction for the system is $11,830,000, or £2,464,583.

It is also to be noted that a warning is given with regard to the projected canals. It is stated that there will be but little flow in them, and practically no flushing effect from the tides. These long canals may become nuisances similar to Gowanus Canal and Newtown Creek, and others which could be named. We are told that this must inevitably happen "unless proper measures are taken to protect them." On this point the commission are at present silent, but the question is one of considerable importance, and should be dealt with later.

Housing at Liverpool.—The Liverpool Corporation have resolved upon another important demolition and reconstruction scheme for the following areas: Prince Edwin-street, Rathbone-street, Mason-street, Saltney-street, Blenheim-street, Penrhyn-street, Gore-street, Sparling-street, and Jordan-street. The approximate cost of clearing the land, demolishing existing insanitary property, and building new dwellings will exceed £200,000.

Putney Bridge.—The town clerk of Fulham has communicated with the London County Council urging the necessity, in the interests of public safety, for the widening of Putney Bridge. Accidents which have recently occurred in Fulham-road have directed the attention of the local authority to the matter, and the condition of the bridge is described as dangerous on account of its inadequacy to deal with the great volume of traffic. The Fulham Council has applied for the imposition of a speed-limit for motors from Stamford Bridge to Putney Bridge.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for June is divided between

MR. H. F. WILKINSON,
Borough Engineer's Office,
and Tottenham,

MR. G. B. R. PIMM,
Melrose Gardens,
Wexford,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

252. Girder Bridge—Design a girder bridge to carry a 24-ft. road over a river and railway (at an angle of 60°) of two spans, 70 ft. and 42 ft. respectively. The mean height of road surface above bed of river is 21 ft. 6 in., and 17 ft. above rails, and the foundation is clay. Please show calculations and give an estimate of the cost. ("Nomad.")

253. Hospitals.—Give a typical cross-section of an infectious hospital ward. Specify for finishing the internal surfaces. Give detail sketches of a window. ("M. and C.E.")

256. Leak in Drain Pipes.—What is a reasonable amount of leakage to be expected in newly laid stoneware drain pipes of 6 in. and also 12 in. diameter? State the type of joint, average depth of trench, and class of soil. Is one gallon per mile of pipe per hour a permissible amount? ("Welsh.")

257. Brick-plant. Sketch and describe a plant for making bricks and flags from refuse destructor clinker. (T. R.)

REPLIES TO QUESTIONS.

254. Books.—Would any of your readers kindly recommend any books on bridge construction and tramway construction suitable for the examination of the Institution of Municipal and County Engineers? (F. H. H.)

The following books are recommended for the subjects mentioned:—

"Bridge Construction," by T. Claxton Fidler. Price 30s. Charles Griffin & Co.

Tramway Construction.—"Electric Tramway Traction," by A. D. Greatorex. Price 2s. 6d. St. Bride's Press, Limited.

"Model Answers to Questions set at recent Examinations of the Incorporated Association of Municipal and County Engineers." Price 3s. 6d. St. Bride's Press, Limited. (W. D., *Dudley.*)

255. Surveying.—What effect has a steep hill of moderate height on a survey whose accuracy is important. It is obvious that if the reading of the chain line was taken and plotted the resultant plan would be distorted. Describe the means taken to obviate this distortion. (H. S. G., *Ashford.*)

In surveying, all measurements upon the ground are *reduced* to the *horizontal*, as when plotted the survey represents a perfect plane; and in chaining the line every length should be exactly equal to the base of a right-angle triangle, whose hypotenuse is the corresponding length of slope. Now if the length of the line was measured along the slope of the hill, and this line was plotted as exactly measured, it would be longer than it should appear, and consequently the plan would be distorted. There are several ways to obviate this distortion in making the survey of the hill—namely, by

(1) "Stepping."

(2) Reducing the hypotenusal measure by calculation, having obtained the angles of slopes with the clinometer, Abney level, or any suitable angular instrument.

(1) In "stepping" short lengths of the chain are held in a horizontal position and the extremity transmitted to the ground by means of a plumb bob; the greater the angle of slope the less will be horizontal distance for a given length of slope.

(2) The angle of slope is generally taken with the Abney level, the necessary reduction in the chainage being done as the work proceeds, by setting back the chain the required number of links, as is shown in a table corresponding to the angle of slope observed. Another way is to take the angle of slope and the measurement of the sloping ground and reduce for inclination when plotting. The writer is of opinion, however, that stepping is the best method, as any offsets that may be required will be more easily got by that than by the other methods. (W. D., *Dudley.*)

NOTES.

The errors corrected by the Editor in "C. F. B.'s" answer to Question 238 are received by him with thanks. The figures are a simple clerical error and should be $27 \times 6 \times 6 = 972$ cubic feet = 6,075 gallons. With regard to the detritus tank it was already stated to be too large, and if the plant is for sewage only it is not necessary. Further the word *septic* was inserted by mistake in my reply, as I by no means intended to infer that they were septic tanks. Again, as to the filter it is based on W. Stoddart's figures, and I personally have found it quite sufficient with land treatment—*viz.*, 1 cubic yard for every 10 persons. As to the walls and distributor, that depends entirely upon circumstances. The walls may be strengthened with an earth embankment, probably with soil removed from the site for making the works; and lastly I should advise "Somerset" to use Stoddart's Distributor with the special drip points. When sending in my answer I was taking into consideration the fact that this plant was only required for about 6 years. (C. F. B.)

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTHERN DISTRICT.

A meeting of the above will be held at Keswick on Saturday, July 13th.

PROGRAMME.

10.15 a.m.—Meet at Town Hall. Short paper by Mr. P. M. Hope, on "Keswick and Its Municipal Undertakings."

11.0 a.m.—Leave Town Hall for Thirlmere Waterworks (Manchester supply).
Light refreshments at Nag's Head Hotel, Wythburn, after inspecting waterworks.

1.30 p.m.—Drive to top of Dunmail Raise to inspect new road made by the Cumberland County Council.

2.0 p.m. Drive west side of Thirlmere Lake (over road made and maintained by the Manchester Corporation) to inspect dam and valve house.

2.30 p.m.—Inspect Smaithwaite Bridge and drive through Vale of St. John's to Threlkeld.

3.0 p.m.—Inspect Threlkeld Granite Quarries with the kind permission of the Threlkeld Granite Company.

4.0 p.m.—Return journey to Keswick.

4.40 p.m.—Dinner at Keswick.

Members who are obliged to arrive in Keswick on the Friday evening will be accommodated at the Queen's Hotel (bed and breakfast 4s. 6d. each).

The charge for the motor char-a-banc will be 5s. per head.

The return train leaves Keswick on Saturday evening at 6.29, arriving in Newcastle at 11.5.

JOHN ROBINSON,
Hon. District Secretary.

Union Offices,
Darlington.
July 4, 1912.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Abersychan U.D.C. (June 25th. Mr. Edward Leonard).—£26,000 for the purpose of erecting 156 houses under the provisions of the Housing of the Working Classes Act, being 50 houses at Talywain and Garndiffaith respectively and 56 at Pontnewynydd. Dr. J. W. Mulligan, the medical officer, stated that there had been some overcrowding, and that there were insanitary properties in the district, and that when the council's houses were erected they hoped to deal with the insanitary dwellings.

Alfreton U.D.C. (June 20th. Mr. Edgar Dudley).—£500 for the purposes of public conveniences for women. The council have provisionally acquired premises in King-street, Alfreton, from Mr. Morewood, and it is proposed to construct the conveniences, which will be managed by the present tenant of the shop premises. The clerk, Mr. Cleaver, explained the application, to which there was no opposition.

Crediton U.D.C. (June 27th. Mr. A. W. Brightmore).—£16,300 for the purposes of sewage disposal, including the execution of works in the parish of Crediton Hamlets. The clerk, Mr. J. Symes, stated that of the £16,300 loan, £8,500 was in respect of land, for which a period of 80 years was asked, and £7,800 for sewage works, which it was proposed to repay in 30 years. The chairman of the council, Mr. H. Elston, said they only required five acres of land, but the owner refused to sell that quantity, and they were forced to buy 61 acres. It was proposed to let the remainder for small holdings. Mr. N. Paul Jasper, the engineer, explained the scheme in detail, and evidence was also given by the surveyor, Mr. T. Jones.

Dawlish U.D.C. (June 26th. Mr. W. O. E. Meade-King).—£350 for the widening of the narrow entrance to High-street from the Exeter-road.—There was no opposition.—The clerk (Mr. F. S. Cole) stated that the present balance of loans owing by the town was £9,230.

Falmouth T.C. (June 27th. Mr. W. O. E. Meade-King).—£600 for effecting improvements at Green Bank, and £65 for improvement in Swanpool-street.—It was stated by the borough surveyor (Mr. J. S. Walton) that with regard to the proposal for the improvement at Green Bank it had been brought about by the collapse of the existing retaining wall. With respect to Swanpool-street the borough surveyor said the improvement gave an average widening of about 6 ft. and a width of 18 ft., measured from the existing centre of the present street, and the line had been set out to allow for a continuation of the widening at any future time.

Kirkby-in-Ashfield (June 18th. Mr. R. G. Hetherington).—£10,000 for purposes of sewage works.—There was no opposition to the application.—The inspector made a very exhaustive inquiry into the scheme, which proposes a new line of sewer from the northern point of Low Moor-road to the outfall works; new sewer in Prospect-street and Victoria-road, and a large amount of new work and revision of existing plant at the outfall works.—The inspector afterwards visited the various points affected.

Leeds T.C. (June 14th. Mr. H. R. Hooper). - £58,960 for the purpose of providing additional generating plant with the necessary boilers and accessories at the Whitehall-road station.—The town clerk, Mr. R. E. Fox, stated that it was proposed to put in a 7,500 k.w. turbo alternator with the necessary condensing plant at a cost of £23,000; four boilers and accessories costing £11,300, and switch gear, &c., the estimated cost of which was £9,650.—The plant was not required to replace any existing plant, but was an entirely new addition designed to meet an increase in the demand for electricity. It took twelve months to construct, and several months must be allowed for experimental running. In view of the urgency of the matter the contract had been let pending the inquiry.

Penzance T.C. (June 28th. Mr. W. O. E. Meade-King).—£2,350 for works of water supply.—The town clerk, Mr. T. H. Cornish, stated that in 1902, with the consent of the Local Government Board, they sank a well 100 ft., equipping it with an engine and engine-house, and driving an adit. Now the corporation wanted to extend the adit 360 ft., having discovered that the farther the adit went the greater the supply. To prove that they were proceeding in the right direction the council sank a borehole at Hendra, about a quarter of a mile away, and that hole had just been completed. The bore was put down 120 ft., and they struck a very heavy stream of water. The borough surveyor, Mr. Frank Latham, said the only way to obtain a greater quantity in a given time was to let down the water from the upper country more quickly. This could only be done by extending the adit farther into the elvan formation, which it was proposed to do.

Rawtenstall T.C. (June 18th. Mr. T. C. Ekin).—£2,600 for the purposes of extending and heating the central market hall; £7,500 for purposes of the electricity undertaking; and £423 for the purpose of widening Miller Barn-lane, Waterfoot.—Mr. James Whalley, town clerk, stated that the existing market hall, which was opened on January 18, 1906, was too small, and applications for stalls from existing and intending stallholders were being made. In addition, the existing passages between the stalls were too narrow for the convenience of the public and the stallholders. No arrangements at present existed for the heating of the market hall, and during the winter months it was found to be too cold; hence the reason for the proposals to heat and underdraw the existing and proposed new portions. The application for the loan of £7,500 for the electricity station was made on account of the general development of the work.

Sheffield T.C. (June 25th. Major J. Stewart).—£43,025, of which £27,727 is required for sewage and £15,298 for paving.—Mr. R. M. Prescott, town clerk, said the policy of the council was to expedite as far as possible the conversion of all the existing defective rubble or stone sewers into brick or earthenware pipe sewers. Since 1898, when that policy was inaugurated, the length of the defective sewers in the city had been reduced from about 119 miles to 35 miles. Works of sewerage forming the subject of that inquiry affected sixty-three streets in various parts of the city. In regard to the paving, the town clerk said there were back lanes for which it was sought to get sanction to the borrowing of £9,953. It was proposed to spend £2,812 on Manor-lane from City-road to the ruins of the old Sheffield Manor. The portion of the main road to Rotherham to be paved out of the proposed loan, at an estimated cost of £2,533, was situated in the Tinsley area recently added to the city by the Sheffield Extension Order, 1911. It was an indication that the corporation were giving supervision to their new responsibilities, and looking after their added areas. Mr. W. J. Hadfield, surveyor of highways, asked by the inspector to give reasons for early sanction to the borrowing of the money, stated that it was proposed to double the existing single tramway tracks in Barber-road and Crookes-road, but before doing that they wanted to put the sewer right. In Wilfred-road they wanted to carry out private street works and desired to get the sewer done first.

South Shields T.C. (June 25th. Mr. H. R. Hooper).—£8,301 for new municipal buildings.—The town clerk (Mr. J. Moore Hayton) stated that the corporation obtained their borrowing powers for the municipal buildings under their Act of 1903, the specific sum of £60,000 being fixed for the completi n of the work.—They had expended the £60,000 sanctioned by the Act, and the Local Government Board also sanctioned the further loan of £8,231. The corporation were now asking for sanction to borrow a further sum of £8,301, which would make the total cost of the scheme up to the time of the application £76,532. He was afraid, however, that it would be necessary to apply for a further sanction in respect to the balance due to the architect, and also the costs in connection with an action brought by the architect against the corporation, which, he was glad to be able to say, had now been settled. The settlement of the action was a great relief to the council, who felt that the committee who had charge of the negotiations had come to a very favourable compromise. He estimated that £3,000 of the £8,301 was well within the mark for extras ordered by the corporation, and the litigation accounted for the balance.

Sunderland T.C. (June 26th. Mr. H. R. Hooper).—£37,207 for the purpose of developing the electricity undertaking. Mr. G. D. Duncan, assistant town clerk, said that the application was necessary because of the revival of activities in the shipbuilding and engineering world, the output having largely increased during the past year, and it was necessary to be prepared for the coming winter. Alderman Bruce asked that the Local Government Board might give an early decision, and the Inspector replied that it was clear that additional plant was very desirable, and he would advise the board accordingly.

Tottenham U.D.C. (June 14th. Mr. F. O. Stanford).—£3,021 for inverting and culverting a portion of the Stonebridge brook near the Midland Railway at South

Tottenham, at the rear of Townsend-road, and lowering the invert under the railway bridge. Mr. V. A. Hall, assistant clerk, supported the application on behalf of the council, and said the section under consideration formed part of a comprehensive scheme which the council desired to carry out. The total cost involved in the present work was £4,817, of which the Midland Railway were contributing £1,000 and the Middlesex County Council £796. Mr. W. H. Prescott, Assoc.M.Inst.C.E., said the necessity for the work arose owing to Hornsey sending a considerable quantity of surface water into Tottenham, which frequently had the effect of flooding the Green-lanes and St. Ann's districts, and it was hoped when this improvement was carried out it would relieve those districts.

Winchester T.C. (June 18th. Mr. W. O. F. Meade-King).—£4,361 for the provision of a cemetery at Magdalen Hill Down, in the parish of Chilcomb Without. —The city surveyor, Mr. W. V. Anderson, gave a detailed description of the site and proposed works. The site was chalk, with an overlying surface of 5 in. or 6 in. of soil only. The surface water would be disposed of by surface pits. It was proposed to build a lodge which would give full accommodation for the public on the ground floor, and the first floor would be for the caretaker.

APPLICATIONS FOR LOANS.

Battle U.D.C.—£1,550 for the provision of workmen's cottages.

Bexhill T.C.—£1,190 for the protection of the sea-wall, £300 for groynes, and £140 for road widening.

Branston R.D.C.—£1,375 for the erection of eight cottages.

Chester-le-Street R.D.C.—£2,824 for improvements at Pelton.

Chorley T.C.—£656 for automatic meters and cookers.

Coventry T.C.—£67,000 for municipal buildings.

East Grinstead U.D.C.—£1,000 for works of sewerage.

Glossop T.C.—£7,725 for the provision of new schools.

Southwick (Sussex) U.D.C.—£450, further loan for sewerage works.

Todmorden T.C.—£7,746 for paving works.

Twickenham U.D.C.—£675 for constructing an inclined embankment, faced with stone, along the river-side at Radnor Island.

Wellingborough U.D.C. £3,500 for a road improvement.

LOANS SANCTIONED.

Bexhill T.C. £3,163 for the construction of a new road.

Bishop's Stortford U.D.C.—£1,650 for an improved water-supply scheme.

Eastbourne T.C.—£3,475 for sewerage purposes.

Fulham B.C.—£3,200 for electricity purposes.

Halifax T.C.—£24,000 for the construction of an outfall sewer.

Halstead R.D.C.—£400 for experimental waterworks at Earls Colne.

Haslingden T.C.—£6,250 for street improvement works.

Lancaster T.C.—£1,200 for the provision of a refuse tip.

Llanelly U.D.C.—£770 for the purchase of land for a housing scheme, and £3,900 for the erection of the houses.

Mansfield T.C.—£1,225 for street improvements, and £2,150 for sewerage works.

Nuneaton T.C.—£3,910 for a cookery centre.

Penge U.D.C.—£519 for making up passages.

Penybont U.D.C. £3,690 for sewerage and sewage disposal works.

Southend T.C.—£5,000 for the erection of a swimming bath on the Western Esplanade.

York T.C. £5,423 for the purchase of properties and a new street.

Sewage Disposal at Trowbridge.—With regard to the proposals for extending and improving the sewage disposal works at Trowbridge, the surveyor, Mr. H. Lailey, has prepared plans embodying the conversion of the sedimentation tanks on the "Fieldhouse" principle and double percolation and humus tanks.

Matlock Sewerage.—In connection with the new sewerage scheme at Matlock, the tender of Mr. J. Cottele, of Southport at £24,993, has been accepted for laying the pipe track from Matlock to the outfall works at Cromford, and the tender of Mr. J. W. Wildgoose, of Matlock and Chesterfield at £12,076, for the construction of the outfall works.

Municipal Engineering (Edited by Sydney G. Turner, Assoc.M.Inst.C.E. Price 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.).—This volume consists of model answers to questions set at recent examinations of the Institution of Municipal and County Engineers, and is the second edition. It is practically identical with the first issued. It is not suggested that it should take the place of recognised text-books, but it provides useful summaries of various subjects, as well as indications as to how different types of questions may be answered. Every effort has been made to render the answers as accurate and comprehensive as possible, though they contain more than a candidate would be expected to supply. The answers are founded upon examinations held in Birmingham, London and Manchester. The appendix contains examples of questions on sewerage, sewage disposal, tramway construction, bridges, water supply, road construction, buildings, sanitary science as applied to towns and buildings, drainage, and other matters. It will be seen, therefore, that the book is comprehensive, practical and exhaustive.—*Local Government Journal.*

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Coventry £60,375, Glasgow, Glossop £7,725, Hackney £5,280, Liverpool £60,000, Wandsworth; housing and town planning—Chelmsford; roads and materials—Camberwell £9 291, Middlesex £7,563, Stafford £10,000; sewerage and sewage disposal—Coventry £40,000, Ellesmere, Goole, Middlesbrough £33,000; water, gas and electricity—Margate £17,000.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

ADMINISTRATION.

Bishop's Stortford U.D.C.—In the course of a report to the council on the recent audit the district auditor, Mr. Herbert Lyon, writes: "During the past year the duty of paying the wages to the labourers employed by the council has been transferred from the surveyor (Mr. R. S. Scott) to the clerk. I find that the clerk provides himself with the necessary cash every Saturday morning—about £40—and hands it to the foreman, who carries this considerable amount of cash on his bicycle to the depot, and there pays the men. I understand that the surveyor was relieved of this duty with the view of lightening his work, and I hesitate to recommend anything likely to add to his duties, which seem to me to be even now more than he is easily able to carry out single-handed. I may perhaps be allowed to incidentally mention here that I am informed the surveyor, in order to cope with the work of his office, finds it necessary to be on duty every day from early morning till 10 o'clock every night, as well as half the day on every Sunday. If the surveyor was in a position to employ some clerical assistance in his office, I should recommend that he should be responsible for the payment of the labourers' wages, and that this should be done by means of cheques with endorsed receipts. This practice is one which is adopted by a large number of local authorities, and has many advantages. For this purpose the surveyor would, of course, open a highway account at the bank."

BUILDINGS.

Coventry T.C.—The tender of Messrs. H. Wilcock & Co., of Wolverhampton, for the erection of municipal buildings, at £60,375, has been accepted, subject to the receipt of the necessary sanction of the Local Government Board. Plans are being prepared for two more swimming baths, intended chiefly for school children.

Dumbartonshire C.C.—It has been decided to purchase South Hutcheson Farm, near Drumchapel, consisting of 119 acres, for the sum of £3,250, as a suitable site for the erection of a small-pox hospital, and also in view of the possible arrangements for the erection of sanatoria in conformity with the provisions of the Insurance Act.

Glasgow T.C.—The tender of Messrs. R. McAlpine & Sons, at £13,303, has been accepted for the construction of two bridges over the Forth and Clyde Canal at Dalmuir and Kilbowie, so as to allow the corporation cars to run up to where the Dumbarton and Balloch cars start.

Glossop T.C.—It has been agreed to build a new elementary school, at a cost of £7,725, and to ask the Local Government Board to extend the repayments of the loan over sixty years.

Hackney B.C.—It is proposed to build a branch library in Northwold-road, at an estimated cost of £5,280. The building, of brick with stone dressings, will be arranged on two floors, with similar accommodation to that provided at the Homerton and Dalston branches. On the ground floor there will be a combined news, magazine and reading room, with a juvenile reading-room, the whole being controlled from the porter's room in the entrance hall. The lending library will be on the first floor on the open access system, with bookcases arranged round a gallery over the reading-room, affording the attendant supervision of both the lending library and the reading-room.

Kirbymoorside (Yorks) R.D.C.—The surveyor, Mr. W. D. Rickaby, has been authorised to carry out the widening of two bridges and three large culverts on the Welburn to Nunnington road, at an estimated cost of £150.

Liverpool T.C.—It is reported that the Mersey Docks and Harbour Board have approved the plans and elevation for the new Pierhead Baths which the corporation propose to erect. The site cost £18,500, and it is intended to erect a building for £60,000, to include offices which will probably produce about £1,500 in rent.

Selby U.D.C.—The council have accepted a tender of over £2,000 for the erection of fifteen cottages in East Common-lane. It was decided to negotiate for land in Cow-lane for other working-class dwellings. Eight cottages built on land owned by the council are about ready for occupation, the rents being 5s. 3d. per week clear.

Spalding R.D.C.—The tenders of Mr. George Barnsdale, of Donington, at £998, for the Donington cottages, and that of Mr. John William Derby, of Boston, at £736, for those at Moulton, have been accepted.

Wandsworth B.C.—A letter has been received from the London County Council stating that the council propose in a short time to obtain tenders for reconstructing the bridge over the river Wandle at High-street, Wandsworth, and that in connection with the widening of the road in front of the public baths it is proposed to erect from the river to the entrance gates a wall similar to that at present there, and to re-erect the existing iron railings on the other side of the entrance gates.

HOUSING AND TOWN PLANNING.

Chelmsford T.C. The council have approved of the scheme of the borough surveyor, Mr. P. T. Harrison, for the erection of forty-eight additional houses on the Rainsford-lane site, and the borough surveyor has also been instructed to prepare plans, specifications and estimates for fifty-five more cottages, so as to complete his scheme.

PARKS AND OPEN SPACES.

Bath T.C.—The improvement of Orange-grove is to be carried out, at an estimated cost of £3,500.

Wallasey T.C.—A shelter and pleasure grounds were formally opened at Egremont Ferry on Tuesday last.

REFUSE COLLECTION AND DISPOSAL.

Middlesbrough T.C.—The borough surveyor, Mr. S. E. Burgess, has presented a report, which the Sanitary Committee have approved, for the disposal of the town's refuse by the construction of a staith dock and barge to sea. The suggestion was to build a staith dock on the vacant land at the ferry. There would be an inclined road to a tip from which the refuse would be tipped into the barge lying in the dock at all states of the tide, and then taken out to sea. The dock would be covered with a steel and corrugated-iron roof, and there would be sprinklers working to keep down the dust and smell. Asked if the smell would not still be there and cause a nuisance, Mr. Burgess observed that "people often see smells," and the barge would be out of sight, and if dealt with as was proposed the refuse would not cause any nuisance. The annual cost of the scheme would be £1,317 for the disposal of 20,000 tons, or 1s. 4d. per ton.

ROADS AND MATERIALS.

Berwickshire C.C.—The East District Committee intend to carry out an extensive road improvement on Tower Bridge and Glenfyn roads, and it has been intimated that the Road Board will give a grant of £3,300 towards the total cost, which is estimated at £4,480.

Bexhill T.C.—The tender of Mr. S. Carey, at £1,465, has been accepted for the construction of a new road from North-street to Alexandra-road.

Camberwell B.C.—The Works Committee recommend that Pickwick-road be taken over under the 105th sec. of the Metropolis Management Act, 1855, as a new street.—The same committee recommend that the west side of Peckham Rye from Nigel-road to Barry-road be paved with specially dressed granite setts laid to a close joint, in accordance with the report of the

borough engineer, Mr. W. Oxtoby, at an estimated cost of £9,291, the work to be done by direct employment of labour.

Chelmsford T.C.—The Road Committee have directed the surveyor, Mr. P. T. Harrison, to prepare a scheme for paving with asphalt-bound granite High-street, Springfield-road (between High-street and the iron bridge), and Moulsham-street (between the bridge and Writtle-street). He has also been requested to report on the financial effect of the scheme in regard to the main roads expenditure for a period of five years.

Edinburgh T.C.—The Streets and Buildings Committee have again considered the question of the smooth paving of Montague-street and Learmouth-terrace. The council referred back the previous recommendation of the committee, which was that there be accepted the estimate of the Limmer Asphalt Company for compressed asphalt for Montague-street and of mastic asphalt for Learmouth-terrace. In the first case the estimate is £1,099, and in the second £1,053. The committee adhered to their former recommendation, including paving at High-street, Portobello, at an estimated cost of £1,197.

Galway C.C.—Owing to the increasing disinclination of contractors to tender for road work, the county surveyor, Mr. Moran, has been authorised to increase by 25 per cent the amount of the estimate for each work.

Greenwich B.C.—Tenders are being invited for the forming and paving as a "new street" of that portion of Thorley-place, East Greenwich, which has been added to the "ancient highway" on the south side.

Guildford T.C.—The North-street improvement has been carried out at a cost, as regards work only, of £290. Alderman Ellis said the fact that the estimate for this work was £400, and it had been carried out for £290, reflected great credit on the borough surveyor, Mr. C. G. Mason, and he was entitled to the thanks of the council.

Halifax T.C.—The borough engineer, Mr. J. Lord, has received instructions to reconstruct part of the tram track, at an estimated cost of £2,890.

Islington T.C.—With regard to the proposed scheme for avoiding the expensive widening of Ball's Pond-road for tramway purposes, by making a short length of line through Dorset-street, the council have approved the recommendation of the Joint Committee of the Works Committee and Parliamentary Committee that consent should be given to the county council to proceed with the electrification of the track on the old lines (with passing loops at certain intervals), pending Parliamentary sanction for the Dorset-street line, which will ultimately take the inward traffic.

Kingston (Surrey) T.C.—Under the direction of Mr. R. H. Clucas, the borough surveyor, the contour of an important section of the Portsmouth-road has been improved by raising both carriageway and footway on the riverside, and treating the road surface, formerly water-bound, with "Roadamant." The work has occupied six weeks.

Middlesex C.C.—The wood paving in the Edgware main road from the Metropolitan Railway Bridge to a point near Ash-grove is to be relaid, at an estimated cost of £7,563.

Roxburghshire C.C.—The Hawick District Committee have agreed to lay portions of the Carlisle-Edinburgh road between Mosspaul and Groundistone with Rocmac, at an estimated outlay of over £1,000, and to apply to the Road Board for a contribution towards the work.

Southend T.C.—Warrior-square and the Broadway-market are to be made up under the Private Street Works Act.

Southwick (Sussex) U.D.C.—The surveyor, Mr. G. W. Warr, has been instructed to communicate with the local owners of property with the object of ultimately forming a through road from New Church-road, Hove, to the Southwick railway station.

Stafford T.C.—A scheme has been advanced for the formation of a new road between Laurmascote-road and Lichfield-road, at an estimated cost of £10,000.

Wellingborough U.D.C.—It is estimated that the improvement at the corner of the main road from Finedon leading into Cambridge-street, will cost £3,500. The corner is probably the most dangerous in the town being a right-angle turn at the bottom of a hill.

SEWERAGE AND SEWAGE DISPOSAL.

Birmingham T.C.—An expenditure of £19,000 has been authorised on the construction of a mile of extension of the large main sewer along Highfield-road and Robin Hood-lane. It has been agreed to authorise the committee to reconstruct the culvert of the Hockley Brook under Factory-road and Newton-place, and to carry out other works for preventing the flooding of the Factory-road area, at an estimated cost of £2,700. Drainage and sewerage works are also to be carried out in Wheelwright-road and neighbourhood, at an estimated cost of £3,340.

Chesham U.D.C.—The tender of Mr. W. Wright, of Chesham, at £5,893, has been accepted for the construction of the new sewage outfall works, and the tender of Messrs. A. Mead & Son, of Chesham, at £1,090, for works of sewerage.

Coventry T.C.—The Sewage Farm Committee have in contemplation a scheme for the extension of the system of bacteria filtration, at an estimated cost not exceeding £40,000.

Easingwold R.D.C.—The tender of Messrs. T. Wood & Sons, at £116, has been accepted for the work in connection with the Huby drainage scheme.

Ellesmere R.D.C.—The council have consulted Messrs. Berrington, Son & Watney, engineers, of Westminster and Wolverhampton, with a view to the preparation of a complete sewerage and sewage disposal scheme for the village of Baschurch.

Coole U.D.C.—Tenders are to be obtained for the construction of a pumping station and outfall at Westfield, and also for five main trunk sewers.

Littleborough U.D.C.—The tender of Messrs. Ham, Baker & Co. has been accepted for the supply of sprinklers, iron pipes, and closing valves for the sewage disposal works.

Middlesbrough T.C.—It has been agreed to adopt a portion of the drainage scheme prepared by the borough engineer, Mr. S. E. Burgess (referred to in last week's SURVEYOR), at a cost of £33,000.

Radcliffe U.D.C.—A sewerage scheme for Bank Top is to be carried out at an estimated cost of £900.

South Westmorland R.D.C.—A sewerage scheme is to be carried out for the village of Milnthorpe, at a cost of £341.

Southwick (Sussex) U.D.C.—The council have adopted the original surface-water sewage scheme, as submitted by the surveyor, Mr. G. W. Warr, at an additional total estimated cost of £915. The scheme will be submitted to the Local Government Board with an application for sanction to borrow a further sum of £450 to carry out that portion of the proposed works from the north end of the Green to the termination of the works covered by the present sanction, the balance of the required amount to be applied for when required.

WATER, GAS, AND ELECTRICITY.

Coventry T.C.—It has been agreed to purchase land from Nuneaton Grammar School trustees for erection of the reservoir at Coundor, and to procure an additional supply of water from the Birmingham Corporation.

East Cowes U.D.C.—A report has been approved recommending the adoption of a new water supply by means of a pumping station. The site suggested for the experimental works was the one selected by Mr. Percy Griffiths, M.INST.C.E., in the chalk south-east of Newport, at Burnt House.

Manchester T.C.—The nett surplus of the electricity department for the year ended March 31st last was £28,319, against £27,573 in the corresponding period of last year.

Margate T.C.—The council propose to provide a new pumping engine and pumps at the Wingham pumping station, the plant to be capable of pumping 3,500,000 gallons in twenty-four hours through the existing 18-in. rising main. The estimated cost is: Engines and pumps, £12,375; necessary new well, engine foundations, new engine-house, £4,625, making a total of £17,000.

Newton Abbot R.D.C.—A water supply scheme for Olchard, Ideford, estimated to cost £208, has been referred to the Parochial Committee.

Oldham T.C.—The nett profit of the gasworks undertaking for the past year, after transferring £7,500 to the borough fund, is £10,137.

Oystermouth (Glam.) U.D.C.—The award of the arbitration recently held at the Mumbles respecting

the price to be paid by the council for the Oystermouth Waterworks has just been made known. The amount is £7,740, and the costs of obtaining the Act are £1,250, which, with the costs of the arbitration, make the total cost of acquiring the works £10,000.

Prestatyn U.D.C.—It has been decided by the council to borrow £1,500 for gasworks extensions, and to devote £500 of this sum for the laying of a new main in the estate of Lord Aberconway, which is being developed upon the conditions that the trustees guarantee a return of 15 per cent on the capital outlay.

Skelton (Yorks) U.D.C. — The tender of Messrs. O'Doherty, of Stockton, at £699, has been accepted for a water supply scheme.

Slough U.D.C.—In the matter of the purchase of the waterworks by the council, the umpire, Mr. A. J. Ram, K.C., has made an award for the payment of £90 623 for the undertaking.

MISCELLANEOUS.

Bushey U.D.C.—Messrs. P. W. Macvay & Co., civil engineers, 19 Old Queen-street, Westminster, have been instructed by the council to prepare a contour survey of the whole of the district—which is over 3,000 acres in extent—showing every 10-ft. variation of altitude.

Coventry T.C.—Application is to be made to the Board of Trade for sanction to a loan of £220,538 for the purchase of the tramway undertaking.

Watford U.D.C.—Three horses have been purchased at £56, £64, and £65 respectively.

PERSONAL.

Mr. Hugh Owen, borough surveyor of Flint, is, we regret to state, indisposed.

Mr. M. J. O'Boyle has been appointed assistant county surveyor of Mayo.

Mr. J. H. Hill has been appointed joint surveyor and sanitary inspector of Ripon.

Mr. T. Bowen, borough surveyor of Cardigan, has had his salary increased by £10 per annum.

Mr. J. A. Iveson, surveyor to the Scalby Urban District Council, has had his salary increased by £10 per annum.

Mr. W. J. Howard-Smith, of Westminster, has been retained by the Bootle Corporation to advise on tramway matters.

Mr. E. H. Essex, engineer and surveyor to the Leyton Urban District Council, has had his salary increased to £400 per annum.

Mr. J. A. Budge, deputy road surveyor of Birmingham, has been appointed chief road surveyor, as from July 1st, at a commencing salary of £400.

Prof. A. H. Blanchard, of Columbia University, has been retained by the Board of Water Supply of New York City as consulting highway engineer.

Mr. A. J. Lyddon, ASSOC.M.INST.C.E., P.A.S.I., of the Essex county surveyor's department, Chelmsford, has recently been appointed deputy county surveyor of Essex.

Mr. R. S. Scott, surveyor to the Bishop's Stortford Urban District Council, recently received congratulations upon having completed twenty-five years' service with the council.

Mr. W. E. Jones, sanitary inspector, has been appointed surveyor and building inspector for the Llangendeirne district by the Carmarthen Rural District Council at a salary of £120 a year.

Mr. R. O. Wynne Roberts, M.INST.C.E., we learn from a cable which reached London on Tuesday night, is among those who escaped unhurt from the terrible typhoon visitation which has just cost so many lives at Regina.

Mr. Oswald J. Wilkinson, ASSOC.M.INST.C.E., of the firm of Messrs. Jas. P. Wilkinson, MM.INST.C.E., of Manchester, has been instructed by the Barton-on-Humber Urban District Council to prepare a report on the Sewerage and Sewage Disposal of the district.

Mr. John A. Brodie (the city engineer of Liverpool) returned to his office on Tuesday, and (the *Liverpool Post* says) received the congratulations of many colleagues and other friends on his healthful appearance after a strenuous Eastern tour. It was pleasing, also, to learn that Mrs. Brodie had benefited by the visit to India, and especially by the rest at Delhi while her husband was engaged in the great scheme of the town planning of the new capital.

Mr. Sidney Reginald Drake, surveyor to the Leatherhead Urban District Council, was married on June 26th, at the parish church of the town, to Miss Ethel May Williams, daughter of Mrs. L. Williams, of Leatherhead. The presents numbered about 100. The bridegroom presented the bride with a gold and pearl bracelet, and the bride gave the bridegroom a travelling bag. The members of the urban council presented Mr. Drake with a marble clock, and the council employees gave him a silver rose bowl.

Mr. James Gray Lindsay, the city engineer of Belleville, Ontario, was born in Belfast in 1870, his early training being received from Mr. J. J. McDonnell, C.E., J.P., of that city. Among his experiences are an engagement with the contractors on the Belfast main drainage scheme, a project involving an expenditure of £300,000, and acting for the British Government in the West Indies. He was afterwards offered the position of colonial engineer on the Gold Coast, West Africa but declined it in view of the climate.

Mr. T. Salkield, the city engineer of Delhi, who is at present on leave in England, has just had conferred upon him the Kaisar-i-Hind decoration, which is awarded as a distinction for "important and useful services rendered to His Majesty in his Indian Empire in the advancement of the public interest of such Empire." Municipal engineers generally will congratulate Mr. Salkield upon this well-deserved reward, not only for its personal bearing, but for its recognition of the part municipal engineering plays in "the advancement of the public interest."

Mr. Edwin Ault, of the firm of Shone & Ault, consulting engineers, 47 Victoria-street, Westminster, and Wrexham, died, we greatly regret to learn, at Lahore, on the 24th ult., from heatstroke. Mr. Ault had for many years devoted himself to sewerage and sewage disposal work, and had been connected with a number of important works, both at home and in the East. He was so engaged when death overtook him. He was a member of the Institution of Mechanical Engineers, a Fellow of the Surveyors' Institution, and a member of the Royal Sanitary Institution, among other bodies.

Mr. John Spencer Killick has been appointed an assistant engineer to the Road Board. For nearly eight years Mr. Killick has held the position of surveyor of highways under the Croydon Rural District Council, one of the most important rural areas in England. Between 1899 and 1904 he held a similar appointment under the Maidstone Rural District Council, in 1898 he was an assistant surveyor under the Wombwell (Yorks) Urban District Council, in 1897 an assistant in the surveyor's office under the Hoyland Nether (Yorks) Urban District Council, and in 1894 was articled for three years to the present county surveyor of Oxfordshire. Mr. Killick is an associate member of the Institution of Civil Engineers, and a member of the Institution of Municipal and County Engineers.

Mr. Ernest Richard Lewis, surveyor to the Cranbrook Rural District Council, and brother of Mrs. Oswald A. Bridges, wife of the town surveyor of Bognor, was married to Miss Mary Frances Parson, of "Rodboro," Richmond-terrace, Bognor, at St. Mary Magdalene Church, South Bersted, on Wednesday, June 27th. Among those who were present were Mr. H. W. Bowen, county surveyor of West Sussex, Mr. Frank Harris, surveyor to the Tonbridge Rural District Council, Mr. Oswald A. Bridges, town surveyor, Bognor, Mr. Joseph Tubb, town clerk of Bognor, Mr. Herbert Beadle, Gravesend, Mr. Councillor Edwards, Cranbrook Rural District Council, Mr. Councillor Wm. G. Grice, Bognor Urban District Council, and Mr. F. Pye, gas engineer, Chichester. The guests numbered seventy, and the bride and bridegroom were the recipients of many very handsome presents.

Akonia and the French Motor Race.—The Dieppe Circuit, covering a distance of nearly 50 miles, was most successfully treated with Akonia for dust prevention on the occasion of the Grand Prix Race, organised by the Automobile Club of France. The work, which took about 200 tons of Akonia, and had to be executed within two days, was carried out under the personal supervision of agents of Akonia, Limited. It was found that, independently of the road being dustless, the surface was marvellously smooth—a fact much appreciated by the competitors—and in a splendid state of preservation, even after the race.

METHODS OF DEPOSITING CONCRETE UNDER WATER.

This was one of the subjects reported upon by the Committee on Masonry at the annual meeting of the American Railway Engineering Association. The replies to a circular letter of inquiry (says the *Contract Record*) covered nine methods, as follows: (1) Bottom-dump bucket; (2) tremie (or closed chute); (3) open chutes; (4) sacks; (5) sacks withdrawn; (6) paper bags; (7) open depositing; (8) pneumatic grouting of broken stone; (9) concrete blocks. From an examination of the replies the committee has drawn the following conclusions:

(1) Concrete may be deposited successfully under water, if so handled as to prevent the washing of the cement from the mixture.

(2) Cofferdams should be sufficiently tight to prevent current through the pit, and the water in the pit should be quiet.

(3) The concrete should be deposited in place either by means of a drop-bottom bucket or a tremie, and should not be allowed to fall through the water.

(4) Where a bucket is used, it should be carefully lowered to the bottom and raised to the surface, so as to cause as little disturbance as possible.

(5) Where a tremie is used, it should be kept filled with concrete up to the top of the water level; the discharge end should be kept buried in the freshly deposited mass to prevent emptying, and raised a few inches at a time as the filling progresses.

(6) The surface of the concrete must be kept as nearly level as possible, to avoid the formation of pockets which will retain laitance and sediment.

(7) Where concrete is not deposited continuously, all sediment should be removed from the surface of the concrete, by pumping or otherwise, before depositing fresh concrete.

(8) The concrete should be a 1: 2: 4 mixture and of a "quaking" consistency.

(9) Freshly deposited concrete should not be disturbed.

(10) In open water or where flow of water through the pit cannot be prevented, concrete should be deposited in cloth sacks.

AN AMERICAN ROAD CONGRESS.

The American Road Congress will hold its first annual session in Atlantic City, from September 30th to October 5th. The event will mark the consolidation of forty of the most important road organisations in the United States, and will be presided over by President Taft. The active president will be Prof. Logan Waller Page.

In conjunction with the congress the National Association of Road Machinery and Material Manufacturers will organise an exhibition at which, it is stated, every industry relating to the building and care of roads and bridges will be represented. The exhibit of the U.S. Office of Public Roads will consist of a complete set of miniature working models of rollers, crushers, and various equipment operated by tiny electric motors. The Government's priceless collection of models showing the development of transportation from the primitive human burden-bearer to the modern automobile and locomotive may also form a feature of the exhibition. "Old Trails" exhibits, recalling scenes along the famous old roads, and trails such as "The Old Cumberland Road" and the "Santa Fé Trail," will add picturesqueness to the display.

One of the principal organisations composing the Congress will be the American Association for Highway Improvement, composed of about 1,500 members, who are leaders in their respective lines of activity throughout the United States. Thirty-five organisations for road improvement are identified with the association, and twenty railway companies are giving it their support.

The first two days of the congress will be assigned to the road users under the auspices of the American Automobile Association, the second two days to the great problems of legislation, finance and economics under the auspices of the American Association for Highways Improvement, while the last two days will be given up to the engineers, who will discuss problems of construction and maintenance, and to the various associations which will meet and map out their plans of action, correlate their efforts, and make definite arrangements to pull together in what is called "the greatest campaign for road improvement and wise conservative management ever undertaken."

ROYAL INSTITUTE OF PUBLIC HEALTH CONGRESS IN BERLIN.

THE MUNICIPAL ENGINEERING, ARCHITECTURE AND TOWN PLANNING SECTION.

The Congress of the Royal Institute of Public Health, which opens on Thursday, July 25th, in Berlin, and extends over three days, will be conducted in five sections, the one of special interest to our readers being that devoted to Municipal Engineering, Architecture and Town Planning—over which Mr. P. C. Cowan, D.SC., M.INST.C.E., chief engineer of the Local Government Board of Ireland, will preside, among the vice-presidents being Prof. Henry Adams, M.INST.C.E., Sir Alexander R. Binnie, M.INST.C.E., Mr. John A. Brodie, M.INST.C.E. (city engineer of Liverpool), Mr. W. B. Bryan, M.INST.C.E. (chief engineer of the Metropolitan Water Board), Mr. A. D. Greatorex, M.INST.C.E. (borough engineer of West Bromwich), Sir James Lemon, M.INST.C.E., Mr. T. de Courcy Meade, M.INST.C.E. (city engineer of Manchester), Prof. W. C. Unwin, F.R.S. (president of the Institution of Civil Engineers), Mr. G. W. Willcocks, C.B., M.INST.C.E. (chief engineer to the Local Government Board), and Sir John Wolfe-Barry, K.C.B., F.R.S. Mr. A. J. Martin, M.INST.C.E., is one of the secretaries of the section.

The papers to be read during the three days on which the section will meet include:—

"Water Supply in London," by W. A. Richardson, ASSOC.M.INST.C.E., assistant engineer to the Metropolitan Water Board.

"British Practice in Sewage Disposal," by A. J. Martin, M.INST.C.E.

"Sewer Ventilation," by T. de Courcy Meade, M.INST.C.E.

"Building By-Laws," by J. D. Casswell.

"Town Planning," by Thos. Adams, town planning assistant to the Local Government Board.

"Legal Aspects of Town Planning," by R. E. Willcocks.

"Use of Reinforced Concrete in Architecture," by Prof. Henry Adams, M.INST.C.E.

"The Use of Reinforced Concrete in Engineering," by J. H. Waller.

Papers dealing with the sewage arrangements of Berlin, water sterilisation and street cleaning will be contributed by German delegates to the congress.

Visits to a large number of public institutions in and around Berlin have been arranged in connection with the gathering.

FOR OTHER ADVERTISEMENTS
See End of Paper.

COUNTY BOROUGH OF WEST BROMWICH.
REMOVAL OF TRAMWAY CENTRE POLES.

The Council is prepared to receive Tenders for the Removal of the existing Centre Poles, the Supply and Erection of additional Tramway Poles and other Works in connection therewith.

Plans, Detail Drawings, Specification and Conditions of Contract may be inspected at my Office.

Sealed Tenders, endorsed "Removal of Tramway Poles," must be forwarded to my Office not later than noon on the 16th day of July, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

A. D. GREATOREX, M.INST.C.E.,
Borough Engineer and Surveyor.

Town Hall,
West Bromwich.
July 1, 1912.

ASSISTANT (20), two years articled with Surveyor to growing Urban District, three months Assistant, one year Assistant Draughtsman and Estimating Clerk in large Contractor's offices, Surveyor, Leveller, good Draughtsman; private street works, sewage disposal, buildings, roads, office routine, &c. Excellent references.—BOX 1,168, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

FOR SALE. About 100 second-hand tree guards, 6 ft. high, 2 ft. 3 in. diameter; in good condition. —S. J. Lee Vincent, A.M.I.C.E., Borough Surveyor, Newbury.

Institution of Water Engineers.

SUMMER GENERAL MEETING AT CHELTENHAM.

The following papers were among those presented at the final day's sitting of the recent summer general meeting of the Institution of Water Engineers at Cheltenham:—

THE SELF-POLLUTION OF WATER BY NATURAL GROWTHS.

By J. H. Garrett, M.D., D.P.H., F.L.S.,
Medical Officer of Health, Cheltenham.

The organic polluting material found in all water is derived from living organisms immediately or more remotely, and water often becomes polluted by the decaying bodies or products of the fauna and flora to which it supplies the natural medium of existence.

It is said that hard waters are more given to develop organic growths than soft waters, and there are numerous organisms that require a considerable quantity of inorganic material as a constituent of their skeletal parts. But a very small quantity of contained material, whether of organic or inorganic nature, suffices to allow of some growth taking place in water, microbic growth for example, which, though consisting of an enormous number of individual living units, has an almost inappreciable weight of substance. It may be remembered, however, that water to which the air has free access has power of dissolving the several gases of the air, and that these may supply the nitrogen, oxygen and carbon required by living organisms of various sorts to build up the solid substances of their bodies and that these substances from being at first a part of some living animal or plant will sooner or later suffer death and decay and so come to add an organic pollution to the water.

Thus so long as water is hidden in the deep strata of the earth out of reach of the air it remains of the same composition, but the same water brought to the surface and left for some time exposed to the air in reservoirs or receptacles becomes the habitat of organic growths which, in the course of time, prove themselves capable of altering the chemical composition of the waters, sometimes resulting in such considerable pollution as to render a water, which was in the first instance a spring water of excellent potable quality, quite unfit for drinking.

Apart from organisms of bacterial species of very minute size, and certain other large organisms, the admission of light to the water whose surface is exposed to the air is essential to the development of the living organic bodies that are destined to become water polluters. This is the case with all green growths, light being essential for the development of the chlorophyll, and many plants, being dependent on chlorophyll for their existence, cannot grow except with the assistance of daylight. This is an important point to remember when it is required to keep water free from such growths, and from the effect they produce upon the quality of the water, a dark reservoir proving a sufficient preventive to the undesired phenomenon.

It appears that the water derived from certain rocks exhibits a preferential tendency to develop certain polluting organisms. The water that has filtered through the limestone of the inferior oolite of the Cotswold Hills, for example, is particularly prone to develop the troublesome water plant chara, which affects all water derived direct from springs situated at the base of these rocks, when such water is stored for any considerable time in reservoirs. It is possible that small quantities of phosphate and nitrate contained in the water derived from this source may stimulate the growth of this plant, which also seems to require the presence of carbonate of lime, for it exhibits a peculiar power of forming accretions of calcium carbonate in and about its cells.

CHARA.

This chara is a plant of unique appearance, of a sea-green colour, possessing a stem and whorled arrangement of branches which arise at nodes in regular sequence, and under the microscope the whole plant is seen to have a simple structure consisting of very large cells. During the summer months the plant vegetates apace, reaching a height of more than a foot where it grows in large patches upon the sides and bottom of the reservoir, which serves it best when offering a rough surface, such as that of common brickwork, or loosely laid stones, and serves it ill when consisting of quite smooth cement or concrete, into which it is impossible for roots to penetrate. In fact, the covering of the brickwork with a smooth layer of cement has proved preventive of the growth, at least for a considerable time.

Towards the end of summer the chara begins to die down, its green growth losing in substance and becoming duller in colour, and in connection with its decay numerous minute organisms appear and swarm the water. The most prominent swarming organism in the case of our own reservoirs that are affected with chara is volvox globator. This prevailing secondary growth swarms through the water in the form of green moving balls, with a sparkling reticulated surface, just sufficiently large to be plainly visible to the naked eye when a glass of the water is held up to the light. The decaying chara, together with its accompaniments, entirely spoils the water for drinking purposes, imparting to it a disagreeable odour and taste, and on several occasions we have had to turn to waste a quantity of water so affected. From time to time, as opportunity offers, the reservoirs are cleaned of the chara, when many tons of stinking weed have been removed.

A chemical effect of the growth of chara and its accompaniments in our reservoirs is to add considerably to the organic content dissolved in the water, and to reduce the small quantity of nitrate naturally contained in the water to nitrite. This is learned on comparing the results of analyses of the water as it enters the reservoir from the springs with those of the water from the bulk contained in store. The pity of it is that the water, which as delivered from the springs is of the purest nature, is destined to be deteriorated in this manner.

CRENOTHRIX.

Water containing a trace of iron is liable to be affected by the microscopic filamentous alga crenothrix, which contains no chlorophyll, and is capable of growing in the dark, as within water mains, for example, and the thick coating sometimes found deposited upon the inner surface of water pipes may consist of this organism, together with carbonate of lime and iron rust. But crenothrix sometimes swarms through the water of a reservoir, giving it a red-brown colour for a time. The water supplies of several Continental towns have been visited in this way, but in England, I believe, the only recorded instance is that of our own town of Cheltenham, where in the early spring of 1896 the Dowdeswell reservoir, receiving the head water of the small river Chelt, was affected in a very marked manner with crenothrix. There are some oozings of iron-stained water at several places in the banks of the reservoir, and in the year that the water was affected the reservoir was never filled to overflowing, as it generally is, and the water contained was consequently less well aërated, and more concentrated in local constituents than usual. The organism swarmed through the water, rendering it red in appearance, through the presence of flocculent red-brown masses, or zoogloeæ, and innumerable round spore cells of the size of micrococci, which had also a reddish colour. Filtration removed the greater part, and the dirty sand of the filters had a very unpleasant odour, and from this sand the organism was obtained in concentrated numbers, consisting of threads sprouting from the cell masses, or zoogloeæ, and spores. The water pipes were infected by members of the crenothrix that escaped the filters, and the organism underwent further development and multiplication in the pipes, producing there particularly many of the flocculent cellular zoogloeæ and filaments. The experience afforded a charming microscopic and chemical study, the result of which was published in *Public Health* in October, 1896. The water yielded a bad analysis during the period it was affected, and many complaints in regard to it were received, but no harm to health appeared to follow its consumption. The visitation lasted for about six weeks, when it cured itself spontaneously and completely in a manner remarkably analogous to a zymotic malady in the animal body, in which for a time a microbe swarms, reaches its acme of development, and then dies out.

The waters of the lakes in the Pittville Garden-

at Cheltenham is always turbid, and sometimes in the summer this turbidity becomes very marked, the water being untransparent and of a yellowish green colour, and giving off some amount of odour when at its worst. This is chiefly due to the swarming of the water by a biflagellate protozoon of the monad type. This organism renders the water unsightly. In the upper of these two lakes there appeared in the latter part of the summer of one year an appearance resembling what one might expect if a quantity of blue-green paint had been poured upon a considerable part of the surface of the water of the lake. This was due to an extensive multiplication of the small cellular needle-like organism oscillatoria. It gave off a foul smell.

Similarly, organisms allied to the last-mentioned and resembling under the microscope strings of beads (nostoc and anabæna), and a species of diatom (asterionella), as well as other organisms, have given trouble by developing in water supplies in America and elsewhere.

The nature of the odours given off by these several organisms has been studied in America by Calkins and others, who have shown that they are due to the secretion of essential oils in the substance of the organism, similar, but less pleasant, in odour to the essential oils secreted by odorous plants generally, such as peppermint.

One interesting point in connection with the growth of chara in some of our reservoirs is the fact that the numerous organisms that feed and depend upon this weed make excellent food for trout. The fish that are put into the Hewletts reservoirs, which contain the plant, develop with quite amazing rapidity, quickly outgrowing fish of the same size and sort placed at the same time in our larger reservoir where there is no chara. This fact may be of interest to pisciculturists, or at least to those who are using the Cotswold Hills water, or a water similarly charged with carbonate of lime, in the rearing of trout.

THE USE OF COPPER-SULPHATE IN PURIFYING WATER SUPPLIES.

By George Embrey, F.I.C.,
County Analyst, Gloucestershire.

In the year 1870 the author had frequent opportunities for observing the evil effects of plant growth in the artificial lakes of Sutton-Coldfield, Warwickshire. These were used as fishponds and for pleasure-boats, but the growth of weeds was so extensive as to render them almost useless. Attempts were made to destroy the weeds by fixing scythes to the bottom of a punt and dragging this through the water, afterwards removing the weeds by means of rakes. This method was very costly, and not very effective, but in 1872, in the construction of a railway between Sutton-Coldfield and Walsall, an embankment which passed over the end of one of the lakes was constructed with ferruginous sand, and this, washing into the lake, effected in one season what the cutting method had failed to accomplish in seven; the vegetation was entirely destroyed, and this particular pool (Blackroot Pool) was effectually cleared of weeds.

On coming to reside in Gloucester in 1873, the author observed the bad odour and colour of the drinking water, and on inquiry was informed that this was due to plants growing in the reservoir. He at once suggested the use of ferrous-sulphate to the city surveyor, Mr. R. Read, and an experiment was made on one of the reservoirs. About this time some trouble arose at a tannery due to oxide of iron from rusty pipes staining the skins red; this being wrongly attributed to the iron used in the reservoir, the experiment was discontinued, and for many years the weeds were removed by rakes at considerable expense without any satisfactory result.

The establishment of Bell's filters in 1901 to a considerable extent overcame the difficulty, but the author's attention was at that time directed to the reports of experiments made by the United States Department of Agriculture with copper-sulphate, which seemed to be an effective remedy. In the course of that year some watercress beds were treated with copper-sulphate which was found to destroy the algæ, especially spirogyra, without injuring the watercress. In 1904 and 1905 numerous investigations were made to determine the amount which could be used for the destruction of the lower forms of plant life without destroying the fish or rendering the water unfit for human use. It was found that quantities of 1 to 1,000,000 parts by weight of water, but quantities of 1 to 3,000,000 were sufficient to destroy the algæ which were believed to cause the trouble.

In 1908 permission was given by the Sanitary Committee to carry out an experiment at Witcombe reservoirs, which were at the time choked with Chara Vulgaris. This plant is propagated by means of spores contained in an archegonium, and, fertilised by antheridia from an antheridium, the bursting of the archegonium sets free myriads of minute greenish cells, which, with the countless anthrozoids, give the water a distinct colour and a fishy odour. In consequence of this odour it has been suggested that the particular chara was a new species named Chara Fœtida, but the author does not find that the plant differs in any material respect from the well-known Chara Vulgaris, except in regard to the odour. This, however, was removed by washing the plants, and an examination of the washing water revealed the presence of numerous Spongilla fluviatilis, which gave out a distinctly fishy odour. A portion of these was used to inoculate a nutrient agar medium, which, on incubation, yielded Proteus Vulgaris, a microbe well known to evolve a "fishy" odour, and the author therefore believes that this, and not the much-maligned chara, is the cause of the odour.

METHOD OF APPLICATION.

The author's method of applying the copper-sulphate differs from that usually adopted, which is to place the crystals in a canvas bag and trail this at the stern of a moving boat. The defect of this method is that the copper-sulphate solution is very much diluted before reaching the bottom of the reservoir. This, however, is overcome by scattering the fine crystals over the surface of the water, as in sowing seed, the crystals falling rapidly to the bottom before dissolving. The sulphate is used in the form of a fine powder containing 98 per cent of the salt, the present price of this being 28s. per cwt.

The three reservoirs have capacities, when filled, of 60,000,000 gallons (No. 1) and 30,000,000 gallons each (Nos. 2 and 3), and for these 4 cwt. of sulphate is used, giving approximately a proportion of 1 to 3,000,000. Each reservoir is allowed to stand at least three days, and, if convenient, a week, at the end of which period not a trace of sulphate of copper can be found in the water.

The water should be treated in the early spring (about February), when the bottom is usually covered with diatoms only; in March and April the confervæ make their appearance, and later the chara begins to grow. It has been found that if the treatment is applied in the early stages the diatoms are destroyed, and neither the confervæ nor the chara appear.

The Gloucester reservoirs are stocked with trout, and it has been important not to destroy these. In the author's opinion the roach disappeared, not by their having been poisoned, but owing to the removal of the vegetable food on which they live, and this view is supported by the result of an experiment made at the end of last summer, when, No. 3 reservoir being nearly empty, the rest of the water was, with the sanction of the city surveyor, drawn off, and, the trout having been removed to No. 2 reservoir, only a few starved roach were found remaining.

As regards the question What becomes of the copper-sulphate? it has been suggested that it unites with CO_2, and becomes carbonate, but the author has been unable to find this salt. He has, however, noticed that the stones with which the reservoirs are partly lined become coated with the two oxides of copper, bands of red cuprous oxide being traced, which, after exposure, becomes black by oxidation to cupric oxide. After four years' experience the author can confidently say that the odour and colour so frequently met with in reservoirs containing water collected from the upper lias and inferior oolite can be perfectly removed by the use of sulphate of copper, and that no danger need be feared if the operation be performed with care and under proper supervision.

DISCUSSION.

Mr. William Watts (Wilmslow) wrote: Before animal and vegetable growths can exist in water there must be food in it for them to live upon, and attention should be given to the sources whence the supplies come for preventive remedies. Plants and animals feed on the substances in solution and in suspension in water, and if these substances can be kept out of it the chances of such life surviving are destroyed. Streams supplying water in a flooded condition should be diverted and not allowed to mix with potable supplies, and all water for domestic use should be aerated and atmospherically bleached by exposure as much as possible. Natural springs flowing sufficiently high should be collected and piped direct

to a covered receptacle feeding the supply main, and should not see the light of day until it is drawn from the tap of the consumer. Water retained in darkness for some time appears to have an affinity for collecting atmospheric and other impurities more readily than water from a suitable drainage area. Shallow depths should not be allowed in reservoirs more than can be helped. They are favourable cultivating places for chara and other forms of aquatic plant life, and the breeding and nursing ground for many low forms of animal life. It is a wise plan to lower the water in the reservoirs from time to time when the weed is thriving in order to kill, or at least to check, its growth. Plants and vegetable growth of the kind alluded to in the paper do not grow in deep water, therefore it is better, if possible, to excavate the ground in the shallow edges of reservoirs, using the excavated material in the embankment. The working capacity of most reservoirs is confined in the main to the upper half in the depth of it, and it is in this zone where the removal of the excavations should be made. The area submerged by the rise and fall of the water as it is decanted for use should be stone-pitched, not only to protect the slopes from the wash of the wavelets, but also to retard the growth of plant life. The slopes are naturally sweetened by occasional exposure to the air, and the life forms complained of destroyed. Weed of all kinds should be removed as soon as it appears. Moorland water flowing from the Pennine Hills, treated in this way, requires little or no filtration, especially if the flood water be carefully separated from the normal flow of the streams feeding the reservoir. Peaty discoloration, however, is complained of, but it is harmless, and the stain is largely removed by exposure in the reservoirs. By frequently lowering the water in a reservoir it is possible to destroy the small univalve shells, and aqueous plants growing in it. It is unwise to keep the water at a common level too long, especially in the summer months. Money spent in making the water pure at the source is preferable to chemically treating it in any way. Chemical compounds added to the domestic supply of water to cleanse it of impurities give one a feeling that it passes through a chemist's shop before it reaches the consumer.

Mr. W. T. Burgess said that, as an analyst, he had read Mr. Garrett's paper with interest, but he suggested that analyses might have been given of the water in its normal state and when it was suffering from the effect of the chara. The analyses of these waters from the spring head was so very difficult that only those having considerable experience could possibly recognise the changes taking place. The only thing in favour of storage was the reduction of hardness which it effected. He had occasion some years ago to examine a sample of weed, and at once recognised it as chara of the variety which had the power of attracting to itself CO_2. He found from the analysis that 1 cwt. of the weed contained no less than 20 lb. of CO_2, so that they could calculate how many tons were taken out of the reservoir.

Mr. A. B. E. Blackburn (Sunderland) gave an account of a service reservoir, the bottom of which was lined with limestone, in which he had had a growth corresponding to the description of chara referred to. It grew from between the loose stonework on the floor of the reservoir to a height of 4 ft. or 5 ft. but when he had the bottom relaid and smooth surfaced the growth stopped altogether.

Mr. Luke Hill said he had had what was perhaps a unique experience in connection with the storage of water for the supply of a town. In Georgetown, where he had been engaged in work the rain water was made use of, the storage amounting altogether to about 8,000,000 gallons, and although it was collected by means of the roofs of buildings it was always of a pure nature, one reason for that being the absence of smoke from chimneys, while they had a purifying agent in the mosquitoes which fed on any impurities in the water. It had been suggested that in connection with the measures adopted for the prevention of malaria and yellow fever they should make a trial of a system of screening, a well-known water authority in particular trying to impress on the authorities the necessity for that being done. The contention of that gentleman was that it had never been proved that mosquitoes were the means of purifying the water, but as it seemed clear to him that the mosquitoes fed on something, he (the speaker) inquired what they fed on. The reply he got was, "Heaven knows." The general water supply was brought into the town by means of open canals, and in these they were greatly troubled with natural growths, such as had been referred to by Dr. Garrett. These growths sometimes became so thick that they had to be cut away; in length they were often as much as 4 ft., and they were of a branching nature.

Mr. R. Read (Gloucester), replying to the remarks made with reference to Mr. Embrey's paper, said, in answer to Mr. Burgess, that chara was commonly found in limestone water; in a soft limestone like the oolite it grew very freely. He agreed that chara did not grow on the cement bottom of a reservoir, for a few years ago he cemented the bottom of one of his reservoirs, with the result that there had been no growth since. The covering of a reservoir would, of course, have the same effect, but it was out of the question to cover 27 acres of water. With reference to Mr. Hill's remarks, there was no doubt rain water was very much neglected in this country, and it was surprising that more use was not made of it, considering its usefulness in various directions.

Dr. Garrett, in the course of his reply, said there was no doubt as to the effect which chara had in removing carbonate of lime from water; the reduction was as much as 2 deg. He had been very interested in the remarks of Mr. Burgess, and should like to have an opportunity of seeing the analyses he referred to. These growths naturally did pollute the water chemically to a very great extent. They had been discussing the possibility of covering the bottoms of their reservoirs, in order to get over the difficulty, and Mr. Blackburn's statement would encourage them to do that. The larger green growths were, of course, met with more extensively, and although they were not such gross polluting agents their periodical decay was the means of adding smelling products to the water. Mr. Mill's experiences in British Guiana were new to them. The conditions were, of course, very different to what they were here. In that country they were obliged to store in house cisterns, whereas here it was the general desire to draw off the main direct. They had to depend very largely on the rainfall obtainable from the house tops, but although the conditions were so different in this country, there was no doubt the rainfall might be made more use of than was done at present here. He, however, discouraged the practice of collecting rain water in waterbutts in back yards, where the water became extremely foul. In regard to Mr. Hill's further remarks, medical officers of health were doing their best to kill the larvæ of mosquitoes, on the supposition that the mosquito was an intermediary for the spread of malaria, so that his (Mr. Hill's) assertion that the larvæ was a means of purifying water was at variance with prevailing ideas.

(To be concluded.)

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangement well suited for easy reference.—*The Law Times.*

London County Council Tramways.—In submitting the annual tramway accounts at a recent meeting of the London County Council, Mr. W. J. Squires, chairman of the Highways Committee, said the traffic receipts showed an increase of £123,363 on 1910-11. After meeting debt charges, providing for renewals, and making good a deficiency of £11,966 on the horse lines, there remained a surplus of £84,551, which had been placed to the general reserve fund. The electric traction working expenses were 6·63d. per car mile, compared with 6·48d. last year, an increase due to the increased rateable value of the permanent way. It was hoped that at the end of the year only seven miles of horse tramways would remain to be electrified. He regarded the financial position of the tramways as satisfactory, but the council had a heavy responsibility in providing cheap transit facilities for London and in making provision for street widenings, for which the tramway accounts were debited to the end of last March with a sum of £334,792. The council had repaid debt amounting to £2,079,518 out of revenue. In the case of a private company this sum would have been available for dividend.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By Sydney G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

CONCRETE PAVING IN RESIDENTIAL STREETS.

EXPERIENCE IN AN AMERICAN CITY.

The following notes are from an article by Mr. A. M. Compton, Commissioner of Public Works, Davenport, Iowa, appearing in a recent issue of the *Contract Record*:—

The first concrete paving to be put down at Davenport was laid in the autumn of 1909, and in the following year about 16,000 sq. yds. were laid. By the spring of 1911 the condition of this paving, some of which had been through two winters, was such as seemed to warrant the continued use of concrete, and about 18,000 sq. yds. were put down during the year. In the neighbouring village of Bettendorf concrete paving was laid in the main street for a length of about a mile, the area being 29,000 sq. yds. It is intended to pave another 40,000 sq. ft. with this material in Davenport during the present year. With one exception all the concrete paving in the city has been laid in residential streets where there is no continuous, heavy traffic. It has withstood weather and traffic in a satisfactory manner. In 1910 the contract price varied from $1.27 to $1.37 per sq. yd. (5s. 3½d. to 5s. 8½d.). This was for a 5-in. base of 1: 3: 5 concrete, of 1½-in. limestone and river sand, with a wearing surface of 1: 1 sand mortar, corrugated with grooves about 8 in. apart. A transverse expansion joint, filled with pitch, was provided at every 50 ft.

The blocks of paving, 30 ft. wide and 50 ft. long, developed irregular contraction cracks, and in 1911 the specifications were altered, a 5-in. concrete base of 1: 3: 5 concrete being provided, with a 2-in. wearing surface of 1: 2 sand-cement mortar, a 2-in. transverse expansion joint every 25 ft., a 1-in. expansion joint along each kerb, and a 1½-in. contraction joint midway between the transverse expansion joints. All joints were filled with asphalt. This divided the work into blocks 30 ft. by 12½ ft. The contract rates were from $1.25 to $1.30 per sq. yd. (5s. 2½d. to 5s. 5d.).

A REINFORCED CONCRETE PAVING.

In the same season, 1911, a reinforced concrete pavement was put down in a street with a treacherous subsoil, and subjected to heavy and fast traffic. It consisted of 7 in. of 1: 3: 5 concrete with ½ per cent steel mesh reinforcement near the lower surface. This was wire fencing, and cost 93 cents (3s. 10½d.) per sq. yd. The results have been, so far, promising, for although the kerbing settled badly during heavy rains there were no signs of failure in the pavement itself.

With a view to obtaining a thoroughly satisfactory paving at a moderate first cost, Mr. Compton has recently changed his specification, the 5 in. base of 1: 3: 5 concrete being surmounted by a wearing layer not less than 1½ in. thick in any part, and consisting of 1 part of cement, 1 of sand, and 1 of ½-in. to ¾-in. granite chips. Transverse expansion joints of creosoted, long leaf yellow pine, 1 in. thick, with the grain vertical, are placed 20 ft. apart, and there are 1-in. asphalt joints along the kerbs.

So far the first cost of concrete paving at Davenport has been about 65 per cent of the cost of brick paving, and about 59 per cent of the cost of asphalt paving. In order to reduce the glare from the concrete surface, lamp-black is mixed with the cement, from ½ lb. to 1 lb. with each barrel of cement. One of the difficulties encountered is the length of time that must elapse before the paving is fit for traffic, the usual period allowed being ten days; but sometimes as much as thirty days are necessary. Mr. Compton is of opinion that the expansion joint is the weak point of this type of paving, and "as soon as actual test has proven some scheme for protecting expansion joints successfully, then is concrete paving a success."

Bournemouth Street Lighting.—The Town Council of Bournemouth have decided to abandon electric lighting in the main roads in favour of gas. It is estimated that about £662 will be saved yearly.

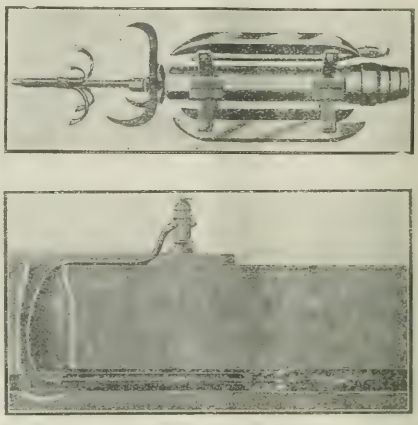
New City of London Subway.—Work is soon to be commenced on the subway beneath Cannon-street from the Mansion House Station to a point opposite Bow-lane. The cost of the work is to be £18,000.

New Bridge at Leeds.—A new bridge spanning the river Aire has been opened at Kirkstall, Leeds. The structure is 156 ft. long and 40 ft. wide, and, including the temporary wooden bridge, the cost was £14,000. The contractors were Messrs. H. Arnold & Son.

SEWER CLEANING DEVICE.

A unique sewer-cleaning machine has recently been developed. It consists of a nozzle supported on runners which discharges through a small turbine water motor, causing one or two sets of hook-shaped blades to revolve rapidly. In so doing the blades stir up the dirt and sediment in the sewer to a thin grout, which the waste water from the turbine carries out. The machine is drawn slowly through the sewer by means of cables operated by windlasses.

A bucket shaped like a half cone and smaller in



Diagrams illustrating Operation of Turbine Sewer Cleaner.

diameter than the sewer is first drawn through backward as far as possible over the dirt, then on pulling forward, the pull comes from the upper back corner of the bucket, and forces the digging edge to the bottom of the sewer. As it is drawn out it carries to the manhole not only the bucket full of dirt, but also a considerable amount of dirt which is pushed ahead of the bucket.—*Scientific American.*

New Use for Sewers.—A Lancashire evening paper two or three days ago advertised in its wanted column: "Wanted, a good sewer, to live in." One of the awkwardnesses of our surprising spelling.—*The Manchester Guardian.*

Alert Siam.—It may be taken as evidence of the widespread interest in modern methods of road improvement, and perhaps also as an indication of the cosmopolitan circulation of The Surveyor, that we should have received recently from Mr. Anuruth Deva, Director-General of the Department of Ways of Communication of Bangkok, the capital of Siam, an order for a copy of "Practical Road Engineering for the New Traffic," edited by H. Percy Boulnois, M.INST.C.E.

The Hours of Roadmen.—The surveyor to the Kirby-moorside (Yorks) Rural District Council, Mr. W. D. Rickaby, at a recent meeting, submitted a revised set of rules under which the roadmen should work, and these contained reference to the hours at which the men should leave home in a morning. Mr. Horton ridiculed the idea of stipulating the hour at which a man should leave home, and said the stipulation should be as to the hour at which the men commenced work. The surveyor replied that such a thing would not work, and would not be quite fair to the men. If a man had to go 3 miles to work in winter, and be on the job at such an hour, it would be unfair. Mr. Horton asked the surveyor if he knew a single farmer in the district who allowed his men to start work at different times. The surveyor replied that he did, and remarked that a roadman started work as soon as he left home. The chairman said he believed it would be very difficult to make the men be at the scene of their work at the hour stated, a lot of them had 4 or 5 miles to go, and he believed it had always been a rule with that council and with other councils to have a fixed time for the men to leave home. The rules suggested were approved.

DISINFECTANTS, ANTISEPTICS AND DEODORANTS, WITH EXAMPLES OF EACH.

By HUBERT S. JACKSON, A.R.SAN.I.

A true disinfectant should destroy sources of infection. Infection is carried by small organisms or germs, each infectious disease claiming a specific organism to itself. Therefore, when we say a disinfectant destroys infection we mean that it destroys organisms which give rise to infection. Temperature has much to do with the prevalence of germs. For instance, a low temperature renders most germs inactive, a medium temperature is conducive to their multiplication, and a high temperature results in their destruction.

We have only to think of the Fire of London in the year 1666, which followed the never-to-be-forgotten plague, to recognise that heat is our greatest disinfectant. Destruction by dry heat, although so sure, is, of course, an expensive way of dealing with infection, and disinfection by dry heat is far less efficacious than by steam, in that a higher temperature can be attained with the latter without danger of scorching, and the steam displaces all the air from the interstices between the fibres of woollen or other material, thus obtaining an even temperature throughout; whereas a bad conductor, such as flannel, would not, if folded, conduct heat to its inner layers. Boiling can be relied on as a safe disinfectant, steam being chiefly recommended in the case of woollen and such other material as cannot be boiled.

On the market at the present time we have disinfectants in every conceivable form—*i.e.*, (1) gaseous, (2) vaporous, (3) liquid, and (4) solid. In the case of gaseous disinfectants, the most frequently practised nowadays is undoubtedly the burning of sulphur (or brimstone) in air. During this process the following chemical action takes place:—

$$S. + 2O_2 = 2SO_2.$$

Sulphur and oxygen yield sulphur dioxide.

It is claimed that sulphur dioxide or sulphurous acid fumes is a great disinfectant, but its efficiency is not determined or fairly tested in a dry atmosphere. Where the atmosphere is damp this disinfectant is most active. It is often used conjointly with a spray disinfector, and the two together are very reliable for safe disinfection. There is, however, a great deterrent to the use of burning sulphur, in that it is a bleaching agent, and also has an action on brass and copper which renders universal use undesirable. As a destroyer of fleas, flies or other vermin, sulphur dioxide has no superior. This disinfectant is also obtainable in a liquid form. It liquefies at −8 deg. Cent., and is then kept under pressure in a sealed vessel and gives off a gas when exposed to air at ordinary temperature. Although this is similar to the product of burning sulphur, it cannot be recommended for the disinfection of rooms, because it has to displace the air before it can itself permeate throughout the room.

A vaporous disinfectant which is well known and used extensively by sanitary authorities is "Formaldehyde." It consists of a white solid that, when heated, gives off a pungent vapour which has very active germicidal properties. If it has a disadvantage it is due to its inability to destroy vermin. A housefly left in a room undergoing disinfection by this method, and hermetically sealed for four hours, becomes stupefied at the end of that time, but readily recovers its vitality on the reopening of the room.

Of the numerous recognised liquid disinfectants carbolic acid is the oldest, but, owing to its poisonous property, it cannot be used with safety. Many others bearing different trade names are extensively used. In calculating the germicidal strength of a disinfectant, carbolic acid is always taken as the unit. For instance, one might read in connection with a disinfectant, "guaranteed coefficient of 16," meaning that such a disinfectant claimed to be sixteen times more active in its germicidal properties than carbolic acid. The present system of standardisation, known as the Rideal-Walker test, is accepted by sanitary authorities in view of the fact that it is the only guide they have in the choice of a disinfectant. A carefully compiled list, giving the germicidal strength of the numerous disinfectants, determined by an independent expert, would be welcomed by many public health officials. At present the test is carried out by the manufacturers themselves, and, while not for a moment doubting the veracity of their figures, it would be better both for sellers and buyers if some independent authority could be mentioned when the coefficient is quoted. But to return to my subject. While not agreeing with everything that is claimed for liquid disinfectants, there is no doubt they are all valuable, if only for the antiseptic properties which they nearly all, if not all, possess.

Of the solid disinfectants, usually sold in powdered form, there is little good to be said. They cannot even claim to be deodorisers, for often they are used merely to blind a smell, security being felt in the fact that the odour from the powder predominates over some vile smell from decomposing matter or the like. Sanitary authorities, who are aware of the misuse of this form of disinfectant, purchase a highly smelling, but cheap, powder for distribution among residents who are ignorant of the snare it really is, and pin their faith to its property of creating a strong, but not unpleasant, odour, which in its intensity blinds all other smells, notwithstanding that they still exist, and will make their presence known when the odour from the disinfectant loses its intensity.

Unlike a disinfectant, an antiseptic does not destroy germ life. It, however, arrests their growth and stops their action and, possessing this property, prevents putrefaction. If an apple is cut in two and left for a short time, it soon becomes a reddish brown. This is due to putrefaction, brought about by germ life. If you cut another apple and smear it with lard you will find that the reddish brown colour does not appear. Lard is an antiseptic, and prevents the action of the germs of putrefaction. In fact, any greasy matter—such as fat, tallow, oil, and the like—possesses antiseptic properties. The reason why an antiseptic prevents putrefaction is due to the fact that one of the necessaries to the germ life has been removed. Let us study their necessities. In order that the germs of putrefaction may thrive and multiply, they must have (1) oxygen, (2) moisture, and (3) warmth. If one of these is absent they are rendered inactive, and cannot thrive. Taking the first—oxygen—for an example, let us consider tinned meat from which all air (oxygen) is excluded. This would keep for an indefinite period so long as the tin remained unopened, whereas, if exposed to the air, putrefaction would render the meat unfit for food in a very few days. The second—moisture. Dried fruit, such as figs, sultanas and currants, remain sound for weeks in dry places, but would soon become unsound if exposed to a humid atmosphere. And the last—warmth. Chilled and frozen meat are examples where the absence of warmth is utilised to prevent putrefaction. Thousands of tons of meat are sent yearly in such state from New Zealand to this country. If raised to an ordinary temperature, putrefaction would soon result in unwholesomeness. In reality, therefore, an antiseptic prevents putrefaction by its property of excluding from that to which it is applied the essentials to germ life.

A deodorant does not destroy germs, neither does it prevent putrefaction. Its function is to remove bad smells, and this is usually brought about by oxidation of decomposing matter from which practically all smells are derived. Oxygen and ozone are rapid deodorants, but the greatest and most reliable of all is soil. Soil absorbs all evil smells, which in reality are gases. These gases are oxidised in the ground, adding to its value for plant production or diffusing into obscurity. To use a highly scented article to blind some evil smell is not only useless, but dangerous. Beyond the deodorants I have mentioned, I know of none that could be recommended with safety.

Town Planning at Huddersfield.—The Housing and Town Planning Committee of the Huddersfield Corporation are inviting competitive designs from architects and surveyors for the laying out of certain areas within the county borough and part of an adjacent suburb prizes of £100, 50 and 25 guineas respectively being offered. The designs, as will be seen from the official advertisement which appears in this issue, are to be sent in by October 31st next, and all particulars as to the competition can be obtained from the borough engineer, Mr. K. F. Campbell, M.INST.C.E. We venture to congratulate the Huddersfield Corporation and its engineer on this latest evidence of the enlightened enterprise which characterises the administration of the city. The result of the competition will be watched with keen interest, and will no doubt have far-reaching effects on future town planning schemes.

IMPROVEMENTS IN ROAD MACHINERY.

At a meeting of the committee appointed by the Local Organising Council of the International Road Congress (London, 1913), to report on machinery used in the construction and maintenance of roads, it was resolved that information relating to improvements effected during the last two years, in sweeping machines, water vans and carts, light and heavy rollers, tar-macadam and concrete mixers, stone driers and heaters, transport engines and wagons, stone crushers, pulsometer pumps, wood block renovators, and any other machinery used for the purpose should be collected.

Manufacturers and others willing to supply particulars are invited to send catalogues to Mr. J. S. Killick, engineering inspector, the Road Board, Queen Anne's Chambers, Westminster, S.W.

£5,000,000 School Building Scheme.—A report providing for the erection of new schools and the enlargement and modernising of existing schools, so as to provide 121,270 additional places, was adopted at a recent meeting of the London County Council. The work will be spread over a period of fifteen years, and the estimated cost is £5,150,000.

Business Announcement.—Messrs. Samuel Deacon & Co., the well-known firm of advertisement agents and contractors, established at Snow Hill over a century ago, who have occupied No. 154 Leadenhall-street for the past fifty-seven years, have removed to No. 7 Leadenhall-street, nearly opposite. We understand their premises have been acquired by a large insurance company for reconstruction.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. Albert D. Greatorex, M.Inst.C.E., Borough Engineer and Surveyor of West Bromwich.

WEST MIDLAND DISTRICT MEETING AT STOURBRIDGE.

A West Midland District meeting is to be held at the Town Hall, Stourbridge, to-morrow (Saturday).

Programme.

10.30 a.m.—Assemble at the council chamber, town hall, where members will be received by the chairman of the urban district council.
District business, minutes, &c.
The following papers (which will be taken as read) will be discussed: "Some Municipal Works at Stourbridge," by Mr. F. Woodward, surveyor to the urban district council. "New Boring Operations" for the Stourbridge and District Water Board, by Mr. W. Fiddian, consulting engineer to the board. "Description of Stourbridge Gasworks and Tar Plant," by Mr. C. H. Webb, engineer and manager, Stourbridge gasworks.

12 noon.—Inspect the engineering works of Messrs. Jones & Attwood, and oil gas plant, and tar dehydration plant at Stourbridge gasworks.

1.30 p.m.—Lunch at the Talbot Hotel, by kind invitation of the urban district council.

2.30 p.m (prompt).—A trip on the Kinver light railway, by kind invitation from the Dudley and District Tramway Company (destructor works and sewage pumping station can be seen *en route*).

3.15 p.m.—Start from Stewpony Hotel (by brake) and drive through the sewage farms belonging to the Stourbridge and Upper Stour Valley Boards.

4.30 p.m.—Inspect as many of the following as time will permit: Public baths, Rocmac road, free library, and secondary school buildings, and tar-macadam plant.

5.30 p.m.—Tea at the town hall, by invitation of Mr. Woodward.

H. Richardson, Assoc.M.Inst.C.E.,
Hon. District Secretary.

Council House,
Handsworth,
Birmingham.

THIRTY-NINTH ANNUAL GENERAL MEETING.

The annual meeting of the institution will be held in the Council Chamber, Caxton Hall, Westminster, on Thursday and Friday, July 11th and 12th, and at the County Hall, Aylesbury, on Saturday, July 13th.

Programme.

Thursday, July 11th.

9.30 a.m.—Meeting of the subscribers to the Orphan Fund.

10 a.m.—Council meeting.

10.30 a.m.—Annual general meeting.
Annual report of council.
Presentation of premiums.
Presidential address.

1 p.m.—Adjournment for lunch.

2 p.m.—Discussion on the following papers (to be taken as read):—
(1) "Masonry Dams," by F. C. Uren.
(2) "Bacteria," by W. Ransom.
(3) "Town Planning in Sheffield," by C. F. Wike.
(4) "Town Planning," by W. H. Price (Student).
(5) "Standardisation," by E. J. Elford.
Adjournment.

6.30 p.m. for 7 p.m.—Reception in the Oak Room of the Hotel Cecil, by the president. Annual dinner in the Victoria Hall. Ladies are especially invited to be present.

9.30 p.m.—Concert.

Friday, July 12th.

10 a.m. Discussion on the following papers (to be taken as read):—
(6) "Maintenance of Sewers in Hampstead," by O. E. Winter.
(7) "Bituminous-bound Carriageways," by J. S. Brodie.
(8) "Road Maintenance in County Armagh," by R. H. Dorman.
(9) "Scottish Roads," by Allan Stevenson.
(10) "How the New District Committees may Promote the Progress of the Institution," by A. H. Campbell.

1 p.m.—Adjournment for lunch.

Programme of Visits.

Friday, July 12th.

Party "A"—Norwood.

2.30 p.m.—The party will assemble at Victoria Station (London, Brighton and South Coast Railway). Members will book independently.

2.43 p.m.—Depart for Crystal Palace (change).

3.20 p.m.—Arrive Norwood Junction.
Proceed to inspect reinforced concrete subway, 9 ft. 6 in. diameter, by invitation of Mr. G. F. Carter, who will kindly conduct the party over the work.

Party "B"—Sidcup.

2.40 p.m.—The party will assemble at Charing Cross Station (South-Eastern and Chatham Railway). Members will book independently to New Eltham.

2.50 p.m.—Train leaves for New Eltham, where members will alight on the outward journey.

3.32 p.m.—Inspection of sections of road, of various materials, laid for testing by the Kent County Council, for the Road Board, *en route* to Sidcup.

Party "C"—Hampstead.

2.45 p.m.—The party will assemble at Golder's Green Station. Guides will meet the party to conduct them through the Hampstead Garden City. Members will travel independently.

Party "D"—Westminster.

2.45 p.m.—The party will assemble at Westminster Bridge (south side) at the London County Council County Hall, in course of erection by Mr. Ralph Knott and Mr. W. E. Riley, and proceed to inspect the works, by kind invitation.

Saturday, July 13th.

Visit to Aylesbury, Tring, &c.

9.15 a.m.—The members will assemble at Marylebone (Great Central Railway).

9.25 a.m. Depart for Aylesbury.

10.45 a.m.—Arrive Aylesbury. Proceed to the County Hall. The members will be received by Mr. Tonman Mosley, C.B., chairman of the Buckinghamshire County Council, and Mr. H. L. Nippin, J.P., chairman of the Aylesbury Urban District Council.

Discussion on the following paper (to be taken as read):—

(11) "Municipality Work in Aylesbury," by W. H. Taylor.

Proceed by conveyances along roads bituminously bound, tar-painted, &c., to the Chiltern Hills Spring Water Company's works, near St. Leonards (by kind permission of the chairman and directors), where members will be received by Mr. H. A. Callon, assistant manager.

1.45 p.m.—Leave for Tring.

2 p.m.—Luncheon at the "Rose and Crown" Hotel.

3 p.m.—The Honourable Walter Rothschild will receive the members at his museum, over which he has kindly consented to conduct the party.

It is hoped that arrangements can be made for affording members an opportunity of seeing the grounds of Tring Park.

4 p.m.—Leave for Aylesbury.

4.45 p.m.—Arrive at Aylesbury, where tea will be provided at "The Chantry" by the president.

Ladies are invited to attend the annual meeting and the visits. The permission of the president may in their case be assumed, but due notice must be given on the reply form.

CHAS. JONES, M.INST.C.E.,
Hon. Secretary.

Mr A. D. Greatorex, the president (W.M. Edile Lodge), writing from Grovecrescent, West Bromwich, says:—

"In connection with the annual meeting it has been arranged on the second evening, Friday, July 12th, to hold a meeting of the Ædile Lodge of Freemasons at the Liverpool-street Hotel at 7 o'clock. The lodge is composed of local government officers, including many municipal engineers, and it is felt that it will afford a good opportunity for bringing together those engineers and surveyors who are concerned with the craft."

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Members attending the annual meeting are invited to use the Municipal County Club as hon. members.

THOMAS COLE,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. STICKLAND, ASSOC.M.INST.C.E., Borough Surveyor, Windsor.

COUNCIL MEETING.

At a meeting of the Council, held on June 22nd, the following applicants were recommended for admission:—

To Membership: Messrs. A. W. Humpherson, borough surveyor, Bewdley, and Levi John, surveyor, Conway and Glen Conway Rural District Council.

To Associate Membership: Messrs. P. W. Smith, Public Works Department, Georgetown, British Guiana, and J. W. Hart, deputy engineer and surveyor, Hindle Urban District Council.

Transfer to Membership: Mr. E. J. Edgar, Public Works Department, New South Wales Government.

Transfer to Associate Membership: Messrs. M. R. Boyce, surveyor's office, Tilbury Urban District Council, and H. A. Scott, surveyor's office, Esher and the Dittons Urban District Council.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

NEW MEMBERS, &c.

From the applicants recommended for admission at the last meeting six associate members were elected.

ROYAL SANITARY INSTITUTE CONGRESS.

A delegate was appointed to attend the congress to be held at York in July on behalf of the institution.

N.A.L.G.O.

The following resolution, passed by the Southern District Committee: "That the council be asked to forward to all members of the institution a short statement of the work and objects of the N.A.L.G.O., with a request that members either join the association direct or form themselves into local associations in their respective districts," was considered, and was ultimately referred to the Special Purposes Committee for report.

COUNCIL MEETING.

The next meeting will be held on Wednesday, July 24th, at 6 o'clock.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*
June 24, 1912.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—MR. JOHN D. WATSON, M.INST.C.E.

ANNUAL GENERAL SUMMER MEETING.

The annual general summer meeting of the Association of Managers of Sewage Disposal Works will be held at Wolverhampton to-morrow (Saturday).

PROGRAMME.

11 a.m.—Reception by the Mayor (Councillor T. W. Dickinson, J.P.), to be followed by papers:—(1) "Notes on Methods of Differentiating Soils for Sewage Purification." Dr. G. J. Fowler, F.I.C., and Mr. Wm. Clifford, ASSOC.M.INST.C.E.

(2) "Deodorisation Methods in Use at Stratford-on-Avon for the Prevention of Aerial Nuisance from Sewage Containing Brewery Waste." Mr. Herbert D. Bell, manager, Stratford-on-Avon.

1 p.m.—Lunch, Star and Garter Hotel.

2 p.m.—Assemble for conveyance by brakes to sewage works and farm.

2.30 p.m.—Arrive at works. Description by manager (Mr. Wm. Clifford).

3.30 p.m.—Visit farm.

4.30 p.m.—Tea, by invitation of the Sewage Works Committee. Votes of thanks.

ROYAL SANITARY INSTITUTE.

ANNUAL CONGRESS AND EXHIBITION AT YORK.

The annual congress of the Royal Sanitary Institute, which is to take place this year at York, will open on July 29th. The proceedings will commence with a reception of the members and delegates in the Mansion House by the Lord Mayor, a public luncheon following, and in the evening the inaugural address to the congress will be delivered by the Archbishop of York.

On Tuesday, July 30th, a conference of municipal representatives and of engineers and surveyors will be held in the Exhibition Buildings, and on Friday, August 2nd, and the following day, the Engineering and Architecture Section will meet in the Museum. Mr. A. D. Greatorex, M.INST.C.E., borough engineer and surveyor of West Bromwich, will preside at the conference of engineers and surveyors, and the section devoted to engineering and architecture will have as its chairman Mr. J. Walker Smith, M.INST.C.E., chief engineering inspector to the Local Government Board for Scotland.

At the conference of engineers and surveyors discussions will take place on, among others, the subjects of Housing and Town Planning Progress, to be opened by Mr. H. Gilbert Whyatt, ASSOC.M.INST.C.E., borough engineer and surveyor, Grimsby, and Sewage Disposal in Rural Districts, to be opened by Mr. Ascough Rodwell, surveyor to the Skipton Rural District Council. The question of the modification of the Model Building By-laws from the rural point of view will be considered in the Engineering and Architecture Section.

The opening of the Health Exhibition arranged in connection with the congress has been fixed for Saturday, July 27th.

INSTITUTE OF SANITARY ENGINEERS.

President—Mr. A. J. Martin, M.Inst.C.E., F.G.S., F.R.San.I.

SUMMER VISIT TO BIRMINGHAM.

Arrangements have been made for a week-end visit to Birmingham from July 12th to 14th. The Midland Hotel, where a private sitting-room will be set apart for the party, and where the reception dinner, attended by the Lord Mayor, will be held, has been selected for headquarters.

Friday, July 12th.

9.10 a.m.—Train leaves Paddington.
11.10 a.m.—Arrive in Birmingham and proceed to Midland Hotel.
1 p.m.—Reception by the Lord Mayor, Alderman Bowater, at the Council House.
Sessional meeting in the afternoon, discussion on papers.
7 p.m.—Dinner, the president in the chair.

Saturday, July 13th.

10 a.m.—Leave hotel by coaches to visit sewage farm, filter-beds, &c., and return to hotel.
Visits to University and other places of interest.

Members (who may bring friends) intending to join the party are desired to communicate as early as possible with the secretary.

P. N. Hasluck.
Secretary.

120 and 122 Victoria-street, S.W.

ROAD CONGRESS DELEGATES' EXPENSES.

LOCAL COVERNMENT BOARD'S STATEMENT.

The Chairman of the Organising Committee of the International Road Congress, 1913, having written to the Local Government Board stating that the committee were anxious to secure small contributions from the local highway authorities towards the expenses of the congress, and a large attendance of road surveyors at the congress itself, and asking the board to sanction expenditure by the local authorities for this purpose, has received a letter stating that, having regard to the exceptional circumstances, the board will be prepared to entertain applications from county and district councils for sanction to the payment of the reasonable expenses of the attendance of highway surveyors.

The communication intimated also that the board will favourably consider any application from a county council or other important highway authority for sanction to the payment of a small subscription to the expenses of the congress.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

CLERK OF WORKS.—July 8th.—South Stoneham Rural District Council. £3 per week.—Mr. E. T. Westlake, clerk, 20 Portland-street, Southampton.

BOROUGH SURVEYOR AND INSPECTOR OF NUISANCES.—July 8th.—Borough of Southwold. £130 per annum.—Mr. Ernest R. Cooper, town clerk.

SURVEYOR'S ASSISTANT.—July 8th.—Ware Urban District Council. £52 per annum.—Mr. G. H. Gisby, clerk.

BOROUGH ENGINEER'S TEMPORARY JUNIOR ASSISTANT.—July 8th.—Corporation of Leigh. £6 per month.—Mr. W. H. Cowburn, town clerk.

INSPECTOR OF NUISANCES.—July 8th.—Royston Urban District Council. £35 per annum.—Mr. H. F. J. Banham, clerk.

ASSISTANT.—July 9th.—Barnoldswick Urban District Council. £70 per annum.—Mr. Wilkinson Ellis, engineer and surveyor.

INSPECTOR OF NUISANCES.—July 9th.—Corporation of Exeter. £200—£250.—Mr. H. Lloyd Parry, town clerk.

SURVEYOR AND INSPECTOR OF NUISANCES.—July 13th.—Newport Pagnell Rural District Council. £200—£240.—Mr. Charles W. Powell, clerk.

SURVEYOR OF HIGHWAYS.—July 13th.—Whittington and Newbold Urban District Council.—Mr. H. J. Watson, clerk, 32 Gluman-gate, Chesterfield.

INSPECTOR OF NUISANCES.—July 13th.—Corporation of Chester. £90—£110 per annum.—Mr. J. H. Dickson, town clerk.

CITY SURVEYOR.—July 15th.—Corporation of Ripon. £150—£200.—Mr. M. Kirkley, town clerk.

CLERK OF WORKS.—July 16th.—Willesden Urban District Council. £175 per annum.—Mr. S. W. Ball, Municipal Offices, Dyne-road, Kilburn.

SUPERVISING ROAD FOREMAN.—July 19th.—Corporation of Grimsby. £2 15s. per week.—Mr. H. Gilbert Whyatt, borough engineer and surveyor.

HIGHWAY SURVEYOR.—July 26th.—Newbury (Berks) Rural District Council.—£100 per annum.—Mr. S. V. Pinniger, clerk, Market-place, Newbury.

ASSISTANT ENGINEER.—August 31st.—Darjeeling Municipality, India. 150 rupees monthly.—The Chairman.

ASSISTANT ENGINEERS.—Public Works Department of the Government of the Gold Coast. £300—£350.—Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W.

CLERK OF WORKS.—Essex County Council. 3 guineas per week.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

ASSISTANT ENGINEER.—For the Public Works Department, Gold Coast. £300—£350 per annum.—Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

CARDIFF.—August 6th.—Designs and estimates for fire station.—The Town Clerk.

GOOLE.—September 1st.—Competitive designs and estimates for municipal offices, for the urban district council. Two premiums (£30 and £15).—Mr. R. Tyson, clerk.

WARRINGTON.—No date.—A public elementary school, for the Education Committee.—The Clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

ELLESMERE.—July 6th.—For the erection of cemetery chapel and convenience, and laying pipe sewer, for the urban district council.—Mr. T. W. Francis, clerk, Ellesmere Park.

BRIGHOUSE.—July 6th.—For the erection of public baths, for the corporation.—Mr. Jas. H. Rothwell, town clerk.

HUDDERSFIELD.—July 6th.—For taking down and rebuilding boundary wall, for the corporation.—Town Clerk.

APPOINTMENTS OPEN.

ESSEX COUNTY COUNCIL.

Wanted, about the middle of July, a Clerk of Works for three months, competent to supervise the construction of a Ferro-Concrete Bridge (Hennebique system) at Ongar, Essex. Only applications from those having previous experience in ferro-concrete will be considered. Salary Three Guineas per week. Applications, with two recent testimonials (copies only) to be sent to

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor,
Chelmsford.

July 1, 1912.

NEWPORT PAGNELL RURAL DISTRICT COUNCIL.

INSPECTOR OF NUISANCES AND SURVEYOR, &c.

The above Council invite applications for the appointment of Inspector of Nuisances, Surveyor under the Public Health Acts, &c., for their Bradwell District, which contains 22 Parishes, an acreage of 27,437, and a population of 9,995. The annual salary of Inspector and Surveyor will be £158, with special payments for the additional duties, estimated at £42 per annum. The salary to include the provision and maintenance of a motor cycle. The salary will be increased by annual increments of £5, until a maximum of £240 per annum, inclusive, is reached.

The Officer will be required to reside at Bradwell, where an office is provided by the Council.

Forms of application and full particulars as to duties, &c., can be obtained from the undersigned by forwarding a stamped addressed foolscap envelope, and the application must be returned to me by Saturday, 13th July.

The Officer will be required to commence his duties on 1st September, 1912.

(By order)

CHARLES W. POWELL,
Clerk to the Rural District Council.

Council Offices,
Newport Pagnell.
June 26, 1912.

DARJEELING MUNICIPALITY, INDIA.

APPOINTMENT OF ASSISTANT ENGINEER.

The Commissioners of Darjeeling Municipality require the services of an Assistant Engineer.

Candidate must have some practical knowledge of sewage works, modern sanitary arrangements, waterworks, the construction and repairs of buildings and roads, and should be able to prepare estimates and reports.

The person appointed will be required to devote the whole of his time to these duties. He will be provided with free quarters and a pony, and will be allowed one Chuprassee.

The salary will commence at Rs.150/- or Rs.200/- monthly, according to qualification, and an increment of Rs.25/- a month will begin in each of the next two succeeding years.

Applications, which should be accompanied by copies of recent testimonials, will be received up to 31st August, 1912.

The Candidate selected will be required to pay his own passage money or train fare, but no security will be required.

Apply to Vice-Chairman

CITY OF RIPON.

ELECTION OF CITY SURVEYOR.

The Corporation require the services of a thoroughly competent Surveyor. For full particulars of duties apply to the undersigned.

The salary will commence at £150, and rise by annual increments of £10 to £200.

Preference will be given to Associate Members of the Institution of Civil Engineers, and to persons holding the "testamur" of the Institution of Municipal and County Engineers.

Applications must be sent in to me on or before the 15th July next. Canvassing, directly or indirectly, will be considered a disqualification.

(Signed) M. KIRKLEY,
Town Clerk.

Town Hall,
Ripon.
June 26, 1912.

The Corporation are requiring a temporary junior Assistant in the Borough Engineer's Office for a period of one year, dating from August 1st next.

Candidates must have been trained in a Borough Engineer's Office. Salary £6 per month.

Applications, stating age and qualifications, together with 3 testimonials, will be received by the undersigned not later than 8th July.

W. H. COWBURN,
Town Clerk.

Town Hall, Leigh.
July 1, 1912.

BARNOLDSWICK URBAN DISTRICT COUNCIL.

The Council invite applications for the position of Assistant in the Surveyor's Office, at a salary of £70 per annum.

Applicants must be neat and expeditious Draughtsmen, accurate Surveyors and Levellers, and possess a good general knowledge of the routine work of a Municipal Surveyor's Office.

Applications, stating age and experience, accompanied by copies only of not more than three recent testimonials, and endorsed "Assistant," must be sent to the undersigned on or before the 9th day of July, 1912.

WILKINSON ELLIS,
Engineer and Surveyor.

Town Hall,
Barnoldswick.
June 28, 1912.

COUNTY BOROUGH OF GRIMSBY.

SUPERVISING ROAD FOREMAN.

The Highways Committee is prepared to consider applications for the position of Supervising Foreman, at a commencing wage of £2 15s. per week.

The town is divided into four districts, each in charge of a foreman, and Candidates for the appointment now vacant must have had experience in the maintenance of roads, and be thoroughly competent organisers. Age not more than 42.

Form of application and outline of duties may be obtained from the undersigned on receipt of a stamped addressed foolscap envelope.

Applications to be sent in not later than noon on Friday, the 19th instant, endorsed "Superintendent Foreman," and addressed to the undersigned.

H. GILBERT WHYATT, A.M.INST.C.E.,
Borough Engineer and Surveyor.

Municipal Buildings,
170 Victoria-street,
Grimsby.
July 2, 1912.

ADVERTISER (Box 1165) desires to thank the numerous applicants for the position of Assistant in a County Surveyor's Office, and to inform them that the vacancy has been filled.

COMPETITIONS OPEN.

COUNTY BOROUGH OF HUDDERSFIELD.

TOWN PLANNING.

The Housing and Town Planning Committee of the Huddersfield Corporation invite Competitive Designs from Architects and Surveyors for the Laying Out of certain areas within the County Borough and part of an adjacent suburb.

The following prizes will be offered—*viz.*:—

1st prize, 100 guineas.
2nd prize, 50 ..
3rd prize, 25 ..

Copies of the Conditions of Competition, and other particulars, may be obtained on application to the Borough Engineer (Mr. K. F. Campbell, M.INST.C.E.) upon depositing Two Guineas. The deposit will be returned on the receipt of *bonâ-fide* designs, together with all documents issued by the Borough Engineer to the Competitor.

The designs, endorsed "Town Planning," must be delivered at the Borough Engineer's Office, 1 Peel-street, Huddersfield, not later than 31st day of October, 1912.

J. HENRY FIELD,
Town Clerk.

Huddersfield.
June 26, 1912.

APPOINTMENTS WANTED.

YOUTH (20) desires appointment; completed 3 years' articles, and Assistant for 6 months with Borough Engineer and Surveyor, M.I.C.E.I., obtaining varied experience; leveller, draughtsman, and typist; experience in water supply, road making and maintenance, sewerage, inspection of new buildings and dwellings under H. and T.P. Act, 1909; office routine and supervision of workmen; testimonials.—"Municipal," office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

MR. R. J. THOMAS, M.INST.C.E.,

County Surveyor, Buckinghamshire.

President of the Institution of Municipal and County Engineers, 1912-13.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. JULY 12, 1912. No. 1,069.

Minutes of Proceedings.

Institution of Municipal and County Engineers: The Annual Meeting.

The thirty-ninth annual general meeting of the Institution of Municipal and County Engineers opened yesterday at Caxton Hall, and it will be continued to-day at the same place (the afternoon, however, being devoted to visits), and to-morrow at Aylesbury and Tring. It is not possible for us to deal in our present issue with the various papers which are being submitted for discussion. We may, however, offer to the Institution and to Mr. R. J. Thomas, M.INST.C.E., the county surveyor of Buckinghamshire, our cordial congratulations upon the inauguration of the latter's year of office as president. Mr. Thomas's address, which was a model of compactness, nevertheless contained very pertinent references to many subjects which are of interest and importance to every municipal engineer. There is probably no profession in which it is of greater importance that the members should keep themselves well abreast of the times than in that of engineering. This applies in a peculiar degree to the local government engineer, whose duties and responsibilities do not grow less as time goes on, and Mr. Thomas rightly insisted on the value of the meetings of the Institution in this connection and on the increased facilities which should be available under the new constitution. Another feature of the work of the Institution which is of the greatest possible value in maintaining a high standard of professional qualification is the system of voluntary examinations. We cordially agree with the new president that the younger members of the profession would do well to obtain the testamur of the Institution at an early stage in their career. We go further and say that it is incumbent upon any engineer who undertakes the responsibility of the professional education of a pupil to point out clearly the serious handicap which will be entailed in the future on any man who does not possess reasonable educational certificates and the diplomas of one or more of the recognised professional examining bodies.

Mr. Thomas of course referred to the important questions of superannuation and security of tenure, and pointed out that, although these desirable objects were still unattained, the only ways in which to secure the desired end are to insist on the anomalies and injustices of the present system on every possible occasion, and to support the practical efforts that are being put forward by the National Association of Local Government Officers to secure Parliamentary sanction for an adequate scheme. The subject of security of tenure naturally led to a reference to the case of Mr. W. Jones, of Colwyn Bay. The facts of this case are now well known, and it is to be hoped that—inasmuch as the funds of the Institution cannot legally be applied to such a purpose—members will voluntarily help to meet the very large expense to which Mr. Jones was put in the vindication of his character against unjust and wholly false aspersions. Even in this matter some good appears to be emerging from an apparent evil, as steps have been taken for the formulation of a scheme for raising a mutual defence fund. Among the other topics to which Mr. Thomas made reference were the work of the Road Board, the Third International Road Congress to be held in London next year, and the advent of the trackless trolley car—all matters of considerable moment to engineers and of great public interest. Mr. Thomas is to be congratulated on his address, which was very well received by the members present at the meeting.

The annual report of the council of the Institution for 1911-12 provides a record of a year's very useful work accomplished on behalf of the members. The achievements are of a very satisfactory character, particularly in regard to the settlement of questions upon which much difference of opinion has existed. The new constitution is now *un fait accompli*, and will no doubt be worked in the interests of the members of every class without regard to past controversies. Among the notable events of the past year must be mentioned the very interesting visit to Paris which took place at Whitsuntide. The members were very cordially and hospitably received, and it is pleasing to note that the council have elected six eminent French engineers as honorary members of the Institution. Looking to the future, it is evident that one of the questions pressing for immediate solution is that of the provision of more adequate and suitable premises for the increasing work of the Institution and for the holding of the numerous council, committee and other meetings. This is one of the matters to which the new council will doubtless address themselves without delay. With an increased membership and every sign of a continued prosperity, there appears to be no reason why the ensuing year should not be one of the most successful in the history of the Institution.

* * *

The Orphan Fund.

It is perhaps appropriate that the very first of the gatherings held in connection with the annual meeting of the Institution is intended specially for the subscribers to the Orphan Fund. We have always felt that the administration of this fund is among the most important features of the Institution's work, and is deserving of far wider support than it has hitherto received. We purposely say "wider' support, because the chief desideratum is not a small number of large subscriptions (welcome as these would be), but rather the necessarily humbler gifts which, if sent in sufficient number, not only serve to swell the funds

available for distribution, but also to encourage the organisers with the knowledge that the excellent work to which they have put their hands has the sympathy and support of the general body of the members of the Institution. That this sympathy exists we have never for one moment doubted. All that is lacking is the thoughtfulness which is required to turn this sympathy into practical action. It is a little discouraging to find that during the past year there has been a slight diminution both in the number of subscribers and in the amount raised. The nature and extent of the work accomplished is shown by the fact that during the period in question a sum of over £108 has been granted to assist in the maintenance and education of thirteen children. We commend the fund to every member of the Institution in the hope that during the current year there may be a large increase in the number of subscribers.

* * *

The Institution: A Retrospect.

In connection with the annual meeting of the Institution of Municipal and County Engineers the brief retrospect of the birth and growth of that body may be read with interest, more especially by those who have only been associated with it in recent years. Its forty years of existence is not a long span in the bridge of time; but it is sad to recall that the *doyen* of municipal engineering—Mr. Jones, of Ealing—is almost the only surviving link with the period of its birth. Mr. Lewis Angell, the father of the Institution, we could last year have coupled with Mr. Jones, as it was only quite recently that we had to record his passing away. In a less personal sense it is also matter for keen regret that the main object for which the unity of municipal engineers and surveyors was brought about in 1870 is still unattained, and the gross injustice of their not being entitled to some security of tenure of office still remains as glaringly unfair as it was then, though since that year protection has been accorded to practically all other sections of local government officials. Still the good work done by the institution in other directions has been invaluable to the profession as a whole and to individual members of it, and there is in our short retrospect nothing but encouragement to the president and council and to their permanent officials to speed the plough with united and renewed energy.

* * *

Staffordshire Roads.

A report on Staffordshire roads by Mr. James Moncur, Assoc.M. Inst.C.E., county surveyor, some extracts from which appeared in our issue of June 7th, is more than a contribution of passing interest, and may be regarded as a permanent addition to those practical notes on road maintenance which are stored on the shelves containing the back numbers of The Surveyor. A point which must be grasped by all who would understand clearly the significance of Mr. Moncur's remarks is the fact that the climate of a part of the North Midlands including the county of Stafford, differs in a marked degree from most of the other climates of the British Isles. Distance from the sea, elevation, topography, and the manner in which different subsoils are distributed throughout the area all these give to Staffordshire and portions of some of the adjoining counties a character which imparts special interest to reports which are based on long continued observations of, and experience with, its roads. This consideration applies particularly to the effects produced by mechanically propelled vehicles. "Ruts or grooves," writes Mr. Moncur, "were quite unknown in Staffordshire until the advent of mechanically propelled vehicles, but it has now become a very serious question as to how to get rid of the trouble." Compare that remark with the following: "In Staffordshire, notwithstanding the long and continued drought of last year, comparatively little disintegration of the surface taking the road as a whole took place, and I cannot help thinking that this was largely due to at least three causes: (*a*) The soundness of the foundations, (*b*) the extended use of the best material for the upper or surface crust consolidated by steam rollers, and (*c*) the changed nature of the traffic from horse to mechanically propelled vehicles." Thus we have the observation that certain damage is largely due, or wholly due, to motor vehicles, and at the same time the opinion that the change from horse to motor vehicles was actually of advantage during the drought of last summer, when in most parts of the British Isles, and especially in the Southern and Eastern counties, excessive wear of roads by fretting under motor traffic was one of the most serious of the difficulties with which surveyors had to contend. Another point of special interest consists in this: that Mr. Moncur finds it advisable to leave snow upon the roads rather than to remove it and so expose the road crust to the action of frost and subsequent thaw. The advantages of leaving a temporary crust of snow to protect the stone crust beneath it were pointed out in our own pages some five years ago, as the result, it is interesting to note, of observations made on Staffordshire roads. The statement that frost heaves and lifts the whole body of the road indicates climatic conditions very different from those of at least a half of England and Wales, where such action is comparatively infrequent. Whether the crushing of stone in frost is really due to the action of the frost upon the stone itself, or is the result of the hardness of the road crust beneath loose stones when subjected to heavy wheel loads, is a moot point. Possibly some of the damage done may be attributed to each cause.

It is interesting to note that, as regards the effect of tarring in prolonging the life of a road, Mr. Moncur prefers at present "to say nothing that would raise false hopes." And here again effects which must be attributed to local conditions are strikingly in evidence in the statement that "during the exceptionally dry weather of the past summer the surfaces adjoining the tarred part kept as sound as the latter." In some cases the surface adjoining a tarred part is kept sound during a period of very small rainfall by the fact that the rain water from small showers is shed by the tarred portion in the middle on to the untarred portion at each side, with the result that a little rain goes a long way in maintaining the crust at a suitable dampness. This consideration cannot, however, be regarded as applying to the long drought of last summer. As regards tarred patching material, we are not surprised to read that the result of using such material prepared beforehand was not satisfactory. Generally, we think the patch should be similar in its nature to the rest of the road crust, though there may be cases when the conditions do not permit of leaving the patch sufficiently long to consolidate properly before it is subjected to heavy traffic, and what is definitely a patch, and may have to be more or less on the "new cloth in an old garment" principle, must be used. But whenever possible the repair should be of the nature of a darn rather than that of a patch, for the significance of which remark any good housewife may be consulted. We entirely agree with the contention that legislation compelling traffic to keep to the near side of the road would be a mistake, not only for the reasons put forward by Mr Moncur, but also from the general consideration that in order to make the best use of the roads the amount of liberty permitted to the drivers of vehicles should be just about what it is now as controlled by custom and by common law.

Water Purification: An Efficient English System.

Steady progress is constantly being made in the development of practical means whereby water for public use is rendered sterile. When this condition of sterility is fully realised the terror of water borne diseases are reduced to the smallest practicable limits as far as the water supply is concerned. But there yet

remain the risks incidental to dust, flies, and the personal element of the consumer himself as to cleanliness and general habits, particularly in the handling of articles of food and drink. These, however, are variable factors often beyond the immediate control of the water consumer or of the water engineer, and if the water supply is pure, statistics show that the chief source of typhoid is removed. The water specialist is now able to do much towards ensuring the safety of a public water-supply, and his efforts are mainly directed towards—(*a*) the destruction of water-borne pathogenic bacteria, such as the cholera vibrio, the bacillus typhosus, and the disease germ indicator, the B. coli communis; (*b*) the removal of organic and other impurities in solution and suspension; (*c*) the removal of iron and plumbo-solvent characteristics; and (*d*) the removal of colour, taste and smell.

Slow sand filtration, especially when combined with adequate preliminary quiescent sedimentation, has done valuable service for many years past, but recent biological research shows that it does not accomplish all that is essential. Dr. A. C. Houston, the eminent bacteriologist of the Metropolitan Water Board, has stated that "sand filtration, although it reduces the total number of bacteria, allows excremental microbes like the B. coli to pass through the filters in much the same proportion as the ordinary water bacteria. Dr. G. J. Fowler, of Manchester, has also pointed out that "it is well known that, unless they are kept under very close scientific supervision, slow sand filters are by no means an absolute safeguard against bacterial pollution." This statement has, during recent years, been corroborated at many places. At Truro, where, notwithstanding the most careful filtration by sand beds of the best type, the B. coli persistently appeared in the water delivered for consumption, an economical and efficient remedy has been found in the introduction of the now well-known "De-Clor" filtration plant, of wholly English design and make. At Reading, where the same system has been in use for some time, it is officially reported that "the B. coli has with one exception always been present in very small quantities of the river (Kennet) water—*i.e.*, in from ·1 to 1 c.c.; while its presence has never been detected in 100 c.c.'s of the filtered water." No extra labour at either of these works has been employed to operate the plants in question, and the only working cost is that of the bleaching powder used, which amounts to about 2s. 3d. per million gallons treated. At Truro the capital cost amounted to about £2,000, as compared with an expenditure of £12,000 which would have been involved had the slow sand filtration principle been extended with a view of meeting the requirements. Equally satisfactory results as to bacteriological efficiency, and also as to initial and working costs, have been experienced at other towns, including Harrogate, where surface moorland water is dealt with on a considerable scale. In view of the general experience in America, to which we have frequently drawn attention, and to the experience gained at home, of which the results quoted above are typical, it is gratifying to find that water authorities in this country are at last turning their attention to the advantages of the "De-Clor" process. The good results produced by the Continental ozone and the ultra-violet rays methods should not be ignored, but in this country we have yet to look for the practical proofs of economical efficiency which are to hand in connection with the "De-Clor" process, a thoroughly efficient English system of proved worth.

* * *

Aerial Nuisance from Sewage Works.

It is not overstating the case to say that whenever an unpleasant smell is noticed by the public it is usually attributed to the drains if near a house, to the sewers if in the street, or to sewage disposal works if there are any within a mile or so. Frequently the blame is wrongly apportioned, as in the case of a sewage farm just on the borders of the London County Council area, where, to our personal knowledge, the sewage works have been blamed for offensive odours arising from a soap works in the next field. On the other hand, it must be admitted that offensive smells are occasionally caused by sewage treatment, and although we may follow the example of the experts, and use the term *aerial nuisance*, "a rose by any other name would smell as sweet." Sometimes it is caused by bad management, at other times by badly designed works. At other places the exceptional local conditions are such that neither good management nor well-designed works of the ordinary type are sufficient to prevent a nuisance. An example of this kind is to be found at Stratford-on-Avon, and the interesting paper read at the annual summer meeting of the Association of Managers of Sewage Disposal Works last Saturday by Mr. Herbert D. Bell, the manager and chemist of these works, shows clearly the enormous difficulties which those in charge of such works are occasionally called upon to meet and overcome. The sewage contains 10 per cent. of brewery wastes, and is delivered to the works through a pumping main which holds about one-sixth of the average daily dry-weather flow. As this rising main must of necessity stand full for a number of hours each day when the pumps are not working, it is obvious that its contents will become septicised even before they reach the tanks provided for preliminary treatment, and thus add to the possibilities of offensive odours arising at the works. But this is not all. As will be seen from Mr. Bell's paper, which we print on another page, the sewage itself is strong, and it receives other exceptional waste liquids besides the brewery wastes which still further increase the difficulties of treatment. The nett result of the experimental work carried out by Mr. Bell is that the adoption of chemical precipitation with lime, in place of the originally designed septic tank treatment, is not in itself sufficient to prevent the creation of offensive odours at all times, and when these are given off from the tank effluent a hypochlorite solution prepared from bleaching powder is added to it in sufficient strength and quantity to oxidise the offending gas and thus remove the cause of the nuisance. We hope there are not many managers of sewage disposal works in the position of Mr. Bell when he took charge of the works at Stratford-on-Avon, but those who have that unenviable distinction will appreciate the immense difficulties which he had to overcome, and will, we are sure, be grateful to him for so freely and so ably putting on record the results of his work for their benefit.

* * *

Gyratory Traffic Regulations.

The recent appearance in a London evening paper of a short note on the gyratory system of traffic regulation as applied to busy road junctions suggests that our readers may like to be reminded that an article on this subject by the same writer, Mr. W. Noble Twelvetrees, M.I.MECH.E., appeared in our issue of October 4, 1907, and was followed by a criticism in our issue of November 29th by Mr. Reginald Ryves, ASSOC. M.INST.C.E. In his SURVEYOR article Mr. Twelvetrees pointed out that this method of regulating traffic was first proposed by Mr. Holroyd Smith, who suggested that Ludgate-circus would be a good place to try it. Mr. Twelvetrees himself argued out the case in a lucid manner, and an important point which he made, and now repeats, is that no physical alterations are necessary in order to make a test—all that is required being that an order should be given to the police to regulate the traffic in the necessary manner. On this point Mr. Ryves took the same view, but argued that the method displays many weaknesses compared with the holding-up system. We need not repeat the arguments for and against, but may refer our readers to the two articles already mentioned, as well as to our own remarks on the same subject in our issue of February 9, 1912.

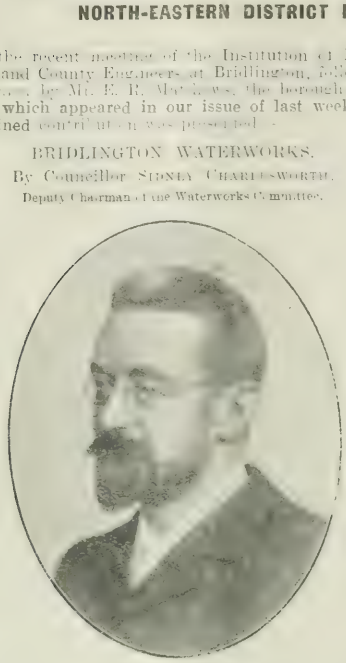
Institution of Municipal and County Engineers.

NORTH-EASTERN DISTRICT MEETING AT BRIDLINGTON.—(*Conclusion.*)

At the recent meeting of the Institution of Municipal and County Engineers at Bridlington, following the paper by Mr. E. R. Matthews, the borough engineer, which appeared in our issue of last week, the subjoined contribution was presented:—

BRIDLINGTON WATERWORKS.

By Councillor Sidney Charlesworth, Deputy Chairman of the Waterworks Committee.



The first record of a public water supply in Bridlington refers to the discovery in 1811 of an ebbing and flowing spring in the harbour, at a depth of 43 ft., by Mr. Benjamin Milne, collector of customs. Mr. Milne had a reservoir made and a pump fixed at his own expense. This supply is still used by the shipping frequenting the port, and by the local fishermen. Some time after the work had been finished, Mr. Milne wrote to the lords feoffees (the lords of the manor) asking them to make him a grant towards the expense he had incurred for the public good, and he seems to have found them very unwilling to help him. In passing, the author would like to mention that exactly a century ago—viz., 1812 John Rennie was consulted, and he reported on a new harbour for Bridlington. Copies of his report are occasionally to be met with in the town.

In 1865 a number of local gentlemen formed themselves into a company under the title of the Bridlington and Quay Water Company, Limited, with a capital of £20,000. They supplied the town without obtaining an Act of Parliament for ten years; then they, with the assistance of the urban district council, obtained an Act with clauses facilitating the purchase of the undertaking by the local authority, and increasing the authorised capital to £40,000. In 1899 the waterworks undertaking was acquired by the town council, the amount paid for it being £70,000. The loan period was fixed at fifty years, and the money was borrowed at 3 per cent. The [illegible] tion—viz., £2,000—was shortly afterwards repaid out of the waterworks revenue. The author was elected on the council on November 1, 1905. He immediately raised the question of the inefficiency of the pumping machinery to meet the needs of a growing town like Bridlington. On January 23, 1906, the Waterworks Committee were empowered to call in expert advice, and Mr. F. J. Bancroft, B.Sc., M.Inst.C.E., waterworks engineer, was asked to report [illegible]

In his report Mr. Bancroft fully endorsed the author's opinion as to the [illegible] plant was old and wasteful in coal consumption, and dangerously inadequate for the work required. He strongly recommended the immediate [illegible] modern pumping engine in duplicate. This the council decided to do, and prepared to apply to the Local Government Board for permission to borrow the money. It was then discovered that, although the Bridlington Water Company's Act gave to the council power to purchase the undertaking from the company and to borrow the money for that purpose, once it became their property they had no power to raise loans for any further developments. It was necessary therefore to amend the Act, and this was done by a Provisional Order obtained in 1908.

The old works consisted of two stations, the upper and the lower. The latter was erected in 1865, at the junction of Long-lane and Marton-road, at a height of 100 ft. above ordnance datum. The area of the site is 1¼ acre; the works consist of engine and boiler house, fitting shop, manager's house, and office, and a disused reservoir. There is a well 6 ft. in diameter and 100 ft. deep. This station has been abandoned for purposes of obtaining a water supply, and the machinery has been broken up and sold.

Owing to the insufficient height of the lower station, the company found they could not give a satisfactory supply, and in 1872 they erected a new station on the site of the present works. It was decided to use a set of wind-driven pumps, and a very substantial windmill tower with heavy head gear was erected. It was soon found, however, that this was not a reliable method, so another pump was obtained, and coupled in a very roundabout manner to a steam engine, which had been designed for driving a saw-mill, and was supplied with steam from a Lancashire boiler. It was afterwards arranged to do away with the windmill, and couple both sets of pumps to the steam engine, which naturally involved further difficulties in gearing. As the engine had no steam-saving device, except a very inefficient feed-water heater, and was coupled to the pumps in a most complicated manner, it was found to be most wasteful in fuel.

The portions of the old works which have been retained are the well, the boiler-house (now used for storing coal), the engine-house, which will be converted into a store-room and workshop, and the reservoir. The old engine and pumps have been broken up and sold, and the boiler converted into a soft-water feed-tank. This we find a most useful adjunct, as it allows soft water to be used for make-up instead of using hard well water. For several years it had been the custom to run both stations continuously night and day, seven days per week, to supply the town during the height of the season. Any one conversant with water supply will realise the enormous risk we were running in so doing. It was most difficult, however, to convince some of the members of the council and ratepayers of the absolute necessity for a new plant, but fortunately we were able to get the new machinery working from the deepened well before the record dry season of 1911 set in; otherwise the results to Bridlington as a health resort would have been disastrous. Owing to the fact that the new engines had to be fixed over the existing well, and that the lower station could not alone supply the town, the difficulty of installing the first set was considerably increased. The new boiler and engine-house having been erected, and the windmill tower pulled down, one half of the well kerbing was removed along with one set of pumps and gearing, the remaining half being then securely strutted and braced to the new dividing wall. The delivery pipe from the remaining pump which had to be used was diverted, to allow the first set of foundations to be put in and its engine erected thereon. Mr. Gibson (our works manager) deserves credit for devising and carrying out this difficult piece of work.

The original specification prepared by Mr. Bancroft called for a duplicate steam-driven plant, capable of easily pumping 1,000 gallons of water per minute at normal speed (speed of pump not more than 120 r.p.m. per minute, and capable of working smoothly and regularly at half-speed, and also at 30 per cent above normal; the engines to be designed to work most economically from a depth of 180 ft., and capable of pumping from a depth of 200 ft. The same conditions were specified for the suction-gas and electricity tenders. The average of the tenders for steam and suction-gas plants worked out at about £8,500. The tenders for the electrically driven plant averaged about £8,000 in each case, with travelling crane and all accessories.

The merits of the three systems were thoroughly discussed by the Waterworks Committee, and it was eventually decided to adopt a steam-driven plant, on account of its flexibility and reliability, especially

when used for well sinking and drifting, which had to be done with the new machinery as soon as it could be installed. The contract for the complete plant was placed with Messrs. Hathorn, Davey & Co., of Leeds, as follows—*viz.*: Two complete compound horizontal differential surface-condensing pumping engines (cylinders 18 in. and 36 in. diameter respectively), each with two pump buckets 17½ in. diameter, with a common stroke for engine and pumps of 4 ft. Two Cornish boilers, 6 ft. diameter by 24 ft. long, with a grate area of 18 sq. ft. each, working pressure 100 lb. per square inch. Two McPhail & Simpson superheaters, each with 350 sq. ft. of heating surface. One Green's economiser, with forty-eight pipes. Small engine for driving scrapers. Two feed pumps. One 10-ton overhead travelling crane. The makers guaranteed that each engine, with its boiler and accessories, when pumping at the rate of 1,000 gallons per minute, against an average head of 180 ft., the amount of best Yorkshire screened steam coal used, having an evaporative capacity of not less than 9 lb. of water per 1 lb. of coal, from and at 210 deg. Fahr., with superheated steam at 100 lb. boiler pressure, and a vacuum of not less than 27 in., shall not exceed 186 lb. per hour; and when pumping a similar quantity under the same conditions, against a total head of 160 ft., the fuel consumption shall not exceed 172 lb. per hour.

BRIDLINGTON WATERWORKS.

Official Trials at Higher Pumping Station.

Contractors: Hathorn Davey & Co., Engineers, Ltd., Leeds.

Consulting Engineer to Corporation: F. J. Bancroft, B.SC., M.I.C.E.

PARTICULARS OF TRIAL.

		Engine No. 1.	Engine No. 2
Date of trial		12/7/11	13/7/11
Duration of trial	hours	10	10
Steam gauge at engine	lb. per sq. in.	95·3	94·4
Temperature at stop valve	° Fah.	399	428
Superheat at stop valve	Fah.	65	94
Cut-off in H.P. cylinder		0·275	0·225
Cut-off in L.P. cylinder		0·4	0·4
Vacuum in condenser	inches	28·1	028·75
Temperature in exhaust pipe	° Fah.	118	116
Temperature corresponding to pressure in condenser	Fah.	99·6	86·1
Double strokes by counter in 10 hours		7,793	8,314
Double strokes per minute		13	13·85
Indicated horse-power of H.P. cylinder		33·95	28·8
Indicated horse-power of L.P. cylinder		26·57	35·75
Total indicated horse-power of engine		60·52	64·55
Mean lift by well gauge	feet	167·7	170
Mean discharge per minute by notch	gals.	1045·5	1078·5
Pump horse-power in water lifted (actual)		53·13	55·55
Efficiency			
Actual P.H.P. in water lifted / I.H.P.	per cent	87·8	86
Boiler gauge	lb. sq. in.	103·7	103·7
Temperature at economiser inlet	° Fah.	91	82
Temperature at economiser outlet	Fah.	166	163·5
Temperature at superheater inlet	Fah.	339	338
Temperature at superheater outlet	Fah.	453	480

Thermal units required to convert 1 lb. of feed water into steam at boiler pressure and superheated as above		1199·9	1217·87
Thermal units utilised from each lb. of coal (calorific value not known)		9587·2	9949·9
Equivalent evaporation per lb. of coal from and at 212° Fah.		9·92	10·3
Steam used per I.H.P. per hour	lb.	23·76	24
Steam used per P.H.P. per hour	lb.	27	28
Coal used per I.H.P. per hour	lb.	2·97	2·95
Coal used per P.H.P. per hour	lb.	3·38	3·43
Equivalent coal consumption per hour when pumping at the rate of 1,000 gallons per minute against an average head of 160 feet	lb.	167	170·4

This guarantee was fulfilled by both engines at the trial, and we have every reason to believe that the consumption under ordinary every-day working conditions has not greatly exceeded the guaranteed amount. The advantages of this type of engine are: Long stroke, slow running, high combined mechanical efficiency of engine and pump, and, for the size of the engine, economical steam consumption. A further advantage is, the top of the well is comparatively clear for withdrawing the buckets and lifting heavy parts in the well. In order to avoid troubles due to high superheat, the steam from the heater is first taken through the low-pressure receiver, and thence round the high-pressure cylinder jacket before it enters the high-pressure steam chest.

In running the plant, it has been found that the Baker's oil separators work very much better with cold-water jets fitted. The delivery mains discharge into a cast-iron tank, placed outside on the edge of the reservoir, with three V notches, and a chute discharging into the reservoir. A fixed scale with a movable pointer gives a ready means of gauging the output of the engines at all times. This tank acts as a balancer when pumping direct into the town mains.

In addition to the main engines there are two steam winches, with double oscillating cylinders and worm gearing, supplied by Messrs. S. A. Ward & Co., of Sheffield, and fitted with their patent reversing gear, a most interesting and simple method of steam distribution for this class of engine. Owing to a rather serious accident, which happened during the erection of the main engine, the Waterworks Committee decided that the hoisting engines, both for material and men, should be so arranged that there was no possibility of throwing the drums out of gear and allowing the weight at the end of the rope to be lowered by the brake only; hence the use of worm gearing on these winches.

As soon as both main engines were completed, and had worked long enough to see that all was in order, then the well sinking and adit driving was undertaken. The original depth of the well was 160 ft. This was lowered to 193 ft., and two adits were driven, each being 50 ft. long. The contract for this work was given to Messrs. B. Robinson & Son, Hull. The prices were 10 guineas per foot for sinking and £2 14s. per foot for drifting. Brickwork in cement, including additional excavation, £3 15s. per cube foot. This work took four months to complete, working double shifts. The town had to be supplied with water partly from this well. The surplus water was discharged into the sewers in various parts of the town.

The Local Government Board have only allowed us fifteen years in which to repay our loan on the new pumping engines. One of the old engines (which was not specially designed for pumping) actually ran, and the boiler was in use, for over forty-five years. The cost of coal saved by putting in new engines is equal to the amount of principal we have to repay annually, the interest being paid out of revenue. The coal used by the new plant is one-third of that required by the old. Our water consumption works out at 43 gallons per head per day for all purposes; in the height of the summer season this is considerably increased.

The metered supply is about 10 per cent of the total; the gas company supply, however, is not metered.

COPY OF ANALYST'S REPORT ON WATER FROM HIGHER WORKS.

Report on water received from Bridlington Corporation, August 2, 1911:—

Locality: Bridlington. Source: Well 192 feet deep. Soil or strata, depth and nature of: chalk.

Colour of water, two feet depth in Lovibond's units = 1·2 blue + 0.5 yellow. Smell at 100° Fahrenheit: faint earthy.

The Sample Contains in Grains per Gallon (parts per 70,000):—

Chlorides equivalent to common salt, 3·23, containing chlorine, 1·97.

Nitrates equivalent to calcium nitrate, none; containing nitric acid, none.

Nitrites, none.

Phosphates, none.

Calcium magnesium carbonates, 15·57 — containing lead, none; hardness, 15·2°

Calcium sulphate, 1·60 — hardness after boiling, 2·1°

Volatile and organic matter (lost by careful ignition), 0·29 — containing ammonia, 0·006; containing alb. ammonia, 0·004; containing proteid ammonia, none; absorbing oxygen in 15 minutes, none; absorbing oxygen in 4 hrs., 0·003

Total Dissolved Solids, 20·69

Sediment: very minute. Microscopic examination does not show the presence of animalculæ.

Micro organisms per 1 cubic centimetre examined by plate culture gives three colonies.

The colonies consisted of the bacillus fluorescens liquefaciens, a non-pathogenic organism.

The chemical analysis and bacteriological examination show this to be a water of excellent quality for drinking and domestic use.

It is a hard water, but the hardness is not sufficient to render it objectionable.

Thomas Fairley,

August 19, 1911. *City and County Analyst.*

It will be seen that our water is very pure, but rather hard; this, however, can be overcome by boiling the water used for drinking, when the temporary hardness of 15·2 deg. is reduced to 2·1 deg. permanent hardness. Bridlington water, after being boiled and then allowed to cool, does not taste flat or insipid. Our water charges are 1s. in the £ on the rateable value; one water-closet, 10s.; extra water-closets, 5s. each; bath, 5s.; water by meter, 1s. per 1,000. It is the intention of the Waterworks Committee to reduce materially the charges on water-closets and baths at the end of the present financial year. The income from the waterworks has increased by about 25 per cent since the corporation acquired the undertaking. Last year the equivalent of a 2d. rate was handed over from the profits towards the reduction of the district rate.

When taking over an existing undertaking from a company by a small local authority, as was done in this case, a council might assume that the existing conditions and machinery were fully equal to the town's immediate future needs, and forget that the selling company have probably been trying to keep capital expenses down, and preparing for some years for a forced sale. The responsible officials and directors have always the demand of the shareholders for dividends to face; hence, they do not prepare so far ahead as municipal officials. It was for these reasons that the Bridlington Council had to undertake the complete renewal of the machinery soon after it had been purchased from the water company.

DISCUSSION OF PAPERS.

Mr. J. S. Brodie (Blackpool) wrote: I have read the advance copy of your paper with very great interest. Both historically as a seaport and in modern times as one of the chief marine resorts in this country, Bridlington stands prominently before us as a monument to the energy and go-aheadness of its municipality, and of the ability and foresight of its engineer. Although unable to be present in person, I hope the meeting will allow me to associate myself with a vote of thanks to the author of the paper for the very valuable and accurate data which has been furnished in the paper, and which will be of very great service to all who are engaged in public engineering works. You will, I am sure, excuse a little criticism on some of the details of your paper. These I make with some diffidence, as I have never had the pleasure of a personal visit to your popular East Coast health resort. I notice that there are still some 20 per cent of your houses within the borough which have no water-closets. I hope this will be a steadily diminishing quantity, until the whole borough is, as we are here at Blackpool, entirely a water-closet town. It would have been of interest if you had supplied us with a little fuller information in regard to your screening arrangements for the sewage before it is discharged into the sea. This is a subject coming now very much to the front, and any information which we sea-coast town engineers can obtain on this subject is very welcome. Also in regard to your waterworks, it would be interesting to be told how you stand in regard to the scale of hardness, as I take it the whole of your supply is from deep wells. You are doing obviously first-rate work in regard to your streets and roads, and one would be grateful to have a few particulars with regard to the intensity of traffic on your 2-in. Scotch granite, bituminous-bound roads. I observe also that your asphalted footpaths are formed with tarred limestone, and I have no doubt that you find these more successful than the use of the primary rocks for this kind of work. Your statistics of wages are certainly very interesting. Your rates of wages are considerably lower—at least to the extent of from 10 to 15 per cent—than what we pay here, none of the permanent labourers in my department being paid below the rate of 6d. per hour. In regard to the cost of your private street works, it would also be interesting if you would state the cost per foot frontage, including all road making, but exclusive of sewers, as the price given (4s. 6d.) seems incredibly low. Your remarks in regard to the sea defence works and sea front improvement works are really very interesting, and you are to be congratulated upon the great success which you have achieved at Bridlington in regard to these works. I note your remarks in regard to the new sea-wall. You will, I hope, excuse me if I differ with you in regard to the form of construction in the shape of steps which you seem to prefer. My criticism of this, which I am sure you will take in good part, is strengthened by a paragraph in your paper in which I am entirely with you when you state: "Undoubtedly the most suitable stone to face a sea-wall with is granite or basalt, especially where the foreshore is chiefly shingle and H.W.O.S.T. rises several feet up the wall." Concrete blocks in such a case are hopelessly inefficient, and I very much fear that even your Bramley Fall rock-faced stone may give trouble in the future, as nothing short of the hardest possible material will withstand the eroding action of the sea on an exposed coast. It appears to me that the stepped face, *pace* the forty years' experience of the Prince's Parade wall, must tend to wear smooth under the eroding action of the sea, whether it be a curved face or a straight face, and therefore that a face more or less smooth to begin with is really the best form of construction; and as regards the scour at the base of the wall, this, after all, is entirely a matter of the cross-section of such face, and if such a wall is properly designed the scour at the base is a negligible quantity. I note your remarks in regard to groynes. My considered judgment in regard to groynes upon a foreshore in front of a marine watering-place is that at best they are a necessary nuisance. They certainly detract very much from the appearance and use by the public of the foreshore of a popular health resort, and here at Blackpool I have made up my mind to do without them altogether and to spend my money on the sea defence works themselves. I think this is a conclusion I have arrived at that will commend itself to engineers responsible for the amenities of their foreshore in popular marine watering-places in the future. In regard to the tree-planting in streets, you are certainly to be congratulated upon the low cost you can plant trees for, as I cannot do anything like it. One would also like to hear if you find any trouble in inducing trees to take root and grow satisfactorily, as here at Blackpool, owing to the exposed nature of the place, it is very difficult to get trees to grow at all.

Mr. E. Massie (Wakefield) said he would like to take the earliest opportunity he had of thanking the members of the North-Eastern District for doing him the honour of electing him as their first chairman of that important district. One did feel that the position they had elected him to was one of which he could be reasonably proud, at the same time he could not help feeling there was a certain amount of responsibility in occupying that position, and it would only be with their cordial co-operation and their great forbearance that he would be able to do justice to

the position they had elected him to. He had no promises to make to them, except this—that it should not be three years from that meeting before they had another meeting in that district. The president had told him it was the desire of the council that meetings should be frequent, and, if possible, they should be quarterly in each district. It would be part of his duty to see that that desire of the council was carried out, and to see that some suitable subject was brought forward at each meeting in order to enhance the interest of the members who attended. After all, they existed as an institution for the benefit of interchanging views on matters which concered their daily task in life, and therefore it would be, as he had already said, his duty to see that some matters were brought forward at each meeting at which members could interchange their views for their mutual benefit, and, indirectly, for the benefit of the authorities they each served. There was one matter which they would have brought forward at their next meeting, and that was to elect an executive committee. The duties of that executive committee were not yet defined by the council of the institution, but he was pressed by Mr. Greatorex to see that there was no long delay in seeing that the duties were set forth, and he impressed upon the president that one power which should be given to the executive was the considering of the qualification of membership for candidates for the institution. He thought they ought to be able to advise the institution with discretion as to the character and capabilities of every candidate who came forward for election. This was done in the Surveyors' Institution. The provincial committees were given that power, and it was one of the things which the council of the Surveyors' Institution thoroughly appreciated. With regard to the papers, there was a good deal of matter in them, and they were very grateful to Mr Charlesworth and to Mr. Matthews, one of their own members, and the very capable engineer of Bridlington, for the kindness and consideration and care they had taken in preparing these papers for their consideration. He had not a great deal to say in criticism of them. He could only agree with what the president had already said, that they were all delighted to see the prosperity of a town like Bridlington. They were also delighted to hear that their rates were so very low. Long might that continue; that was the most sincere wish he could give to the ratepayers of Bridlington. Incidentally it was mentioned that there were such neighbouring seaside resorts as Filey, Whitby and Scarborough, but the comparisons were not given. That day they were there to show their appreciation of the good work done by Bridlington in catering for the amusement and health of the great industrial centres of the West Riding of Yorkshire. One thing which had struck him very forcibly was that the number of empty houses in their district was very small. They who came from the towns in the West Riding wished they could give a similarly small percentage of empty houses. Forty houses, or 1 per cent, seemed a very small number in a town like Bridlington. He remembered not long ago being at an extension enquiry for a large city in Yorkshire where for days and days—nine days—they pleaded with the authorities to bring forward a statement of the number of houses that were empty. For obvious reasons it was not convenient to get that information for them. They could hope that some day those large centres of population would be able to say there was only 1 per cent of houses to let in their districts. Evidently they had not overbuilt in Bridlington, and probably some of them when they went away would be able to persuade some builders to come there and place their capital at Bridlington. Mr. Matthews said there were a number of private streets not in such a good condition as they should be. He hoped before their next visit the corporation would have taken those streets into consideration, and put them into good order. Nowadays they expected everything to look very smart, and the way in which private streets could be made up without any great increased cost to make them more attractive was important. Another matter he would like to ask Mr. Matthews about was the screening of the sewage before it entered the sea. He knew this was something of a delicate topic for a seaside place like Bridlington, but they would be glad to hear something about it. The only other matter he wished to speak about on Mr. Matthews' paper was the town hall. That was a very nice room, bright and cheerful, but not very long ago he had to meet Mr. Matthews, and he was not equally struck with the accommodation he had in his department. No doubt that would be taken into consideration, and they would see that not only the rates were low, and the workpeople were properly housed, but the officials had proper accommodation provided for them. With regard to Mr. Charlesworth's paper, he would like to suggest to the corporation that the extra charges for water-closets and baths should be crossed off as quickly as possible. How could they in a town like Bridlington, whose prosperity depended entirely upon its good name for perfect sanitation, cripple the provision of water-closets and baths by making an extra charge? He was glad to hear that it was the intention to reduce the charge materially, though he would rather hear that it was the intention to cut the charge off entirely. He had great pleasure in moving a hearty vote of thanks to the authors of the papers.

Mr. H. W. SMITH (Scarborough), in seconding the vote of thanks, remarked that he knew Bridlington fairly well. Mr. Matthews was running what in a sense was a rival "show," and it was his (the speaker's) desire to keep ahead of him, if possible. (Laughter.) The small number of empty houses in Bridlington must be matter of congratulation to the corporation, and he had no doubt that the progressive spirit shown by the corporation, backed up by the energy of Mr. Matthews, had a great deal to do with that happy condition of things. Proceeding, Mr. Smith said he wished to congratulate Mr. Massie and Mr. Wakeford on their election to the important positions they now filled. To Mr. Wakeford he would only say he hoped that he would be a great deal more successful in getting members to have meetings in their districts than he (the speaker) had been. No one regretted the lack of success that rewarded his efforts more than himself, and he thought it was good for the society to have a change. The members seemed to have a happy way of promising to arrange for a meeting "next year," but that "next year" never came. If in a year or two Mr. Wakeford asked Scarborough to receive them again, he thought they would be quite prepared to do so. Referring to Mr. Charlesworth's paper, Mr. Smith added that it was very gratifying indeed to have a member of a public body contributing as he had done to one of their meetings, and their thanks were specially due to Councillor Charlesworth in that respect.

Mr. J. H. DREW (Wath-upon-Dearne) said he considered Bridlington was very fortunate in being able to get loans for periods of twenty-seven and thirty years in connection with ferro-concrete work. He was interested in a sewage disposal scheme in which they had to lift the filters, the floors being designed to carry a load of 6 cwt. to the foot, and they had been offered a loan for a period of ten years, but if they were unable to obtain better terms that that he thought it was likely they would scrap the scheme altogether. He saw they had been making an application to the county council to purchase for them a tar-spraying machine, and he should like to know the result of that. With respect to tar-macadam, he also wished to ask whether they used their own gasworks tar or some special preparation; further, perhaps Mr. Matthews would give some information as to the price paid for the material. Like the president, he often went to Bridlington for his holidays, and he could support him in his statement as to the rapid progress which the town had made during the past few years—a great deal of which progress, he agreed, lay to the credit of the borough engineer.

Councillor S. DYER (Bridlington) said he had had the pleasure of being a member of the institution since 1883 or 1884. At one time he was able to attend the meetings more or less regularly, but it had not been possible often since, though he found pleasure in going through the volumes of "Proceedings" which he received. He rose that morning to speak on the subject of housing. During recent years they had demolished a large number of houses of a small type, and it was that class of dwelling that now seemed to be needed in the district. It was not the large house that was required, but the very small ones, which he was afraid were not very remunerative to the owners. The council had just had under consideration a number of small houses for the working classes of the district, but the great bone of contention had been the matter of the site. The committee over which he presided advertised for sites, and they had a large number offered to them. The committee felt that one particular site was more suitable than others, but unfortunately it did not meet the ideas of everyone, and in the council chamber, owing to equal voting, the

matter was referred back to the committee. But on the previous Wednesday the subject came up again and went through, and it was hoped in a short time now to make a beginning with dwellings in which their working classes would be able to live in comfort. The plans of the houses, as they were aware, had been prepared by the borough engineer. They must remember that what they had aimed at all the way through had been to provide a substantial building at a minimum cost, and while the specification had been one that would bear examination, there was nothing of a superfluous nature in it. They were now advertising for tenders for the erection of the houses, and when those were received it was the intention of the council to apply for a loan for the carrying out of the work. They were glad to have a gentleman like Mr. Matthews for their surveyor. He (the speaker) knew something of the duties, for he was for a number of years the surveyor there, and he knew something of the anxieties that fell upon the shoulders of those who held positions of engineers to public bodies. Few people realised what a load that was, and he was delighted to feel there existed a brotherliness between the engineers of the different authorities, so that when they were unfamiliar with particular matters they were able to appeal to others who were and obtain the necessary assistance.

Mr. E. J. Silcock (Westminster and Leeds) said he had some knowledge of Bridlington from the pleasure point of view, and he had also the advantage of knowing something of it from the business point of view. So he claimed a special interest in Bridlington, and he was delighted to see the houses so fully occupied, and to see that the rates were kept so low. He must really congratulate the town upon having produced such excellent results without placing any undue burden upon their inhabitants. These two things reacted one upon the other; the fact that the houses were occupied caused the rates to be low, and the lowness of the rates caused people to come there. The sewerage arrangements there were, he thought, of a favourable character, due to the fact that the town was situate upon rising ground. That was a very great advantage to seaside places, and it was an advantage which all towns did not possess. There were many places, like Southport and other places on the flat coast of Lancashire, where the towns were situate very little above high water level of the sea, with the consequence that they had difficulty with their drainage, and had either to pump or store their sewage, and in some places had to have some kind of treatment before discharge into the sea. There, owing to the greater elevation, it was possible to discharge by gravity at any state of the tide. As to whether or not it was a desirable thing to do was a matter which, if one might be allowed to say so, was one which the corporation would have to carefully watch. The prosperity of a place like Bridlington was so bound up with good sanitation that if there was any fear that the foreshore would be fouled it would have a most disastrous effect upon the town. It did seem to him, without being at all an alarmist, it was a matter which the officials must very carefully watch, and if any ill-effect was seen, deal with it before it was noticed by the general public. As to the sea-wall and foreshore protection works, he thought the excellence of the work was testified to by the fact that they had stood the test of time and the ravages of the sea without showing any signs of deterioration. There were some sea defence works which were not carried out by the council which had not been altogether so successful, but he thought, so far as the works carried out by the corporation were concerned, they had stood most effectively, not only the sea-wall, but the groynes on the foreshore. The stretch of beach was an excellent playground for children, and one of the chief assets of the town, and therefore it was most important that it should be retained at a good level above low water. As to the position of the sea-walls, he quite agreed that the stepped face of the wall was better than the smooth face, whether that face was curved or straight. To his mind the stepped face was less liable to damage through the receding action of the waves than a flat-faced wall. Then he noticed, too, that the walls had been very successful in avoiding the splashing of the water of the advancing waves over the back of the wall. Some walls which were curved had a nasty way of drenching people with water when they walked along the parade, which was very objectionable, besides being a danger to the wall. As to the water-work, one could not help realising that when purchased by the corporation they were not in an altogether satisfactory condition, and the corporation were doing nothing more than their obvious duty in renovating the works and putting in satisfactory machinery. They seemed to have been successful in doing that, and, judging by the results of the official trial, the machinery seemed to be highly efficient and of excellent design. It would be interesting if the author would add some information with regard to the purchase from the company; if he could tell them what the maintainable revenue of the company was before the corporation purchased, and whether the amount of compensation paid included any extra payment for back dividends, or overspent capital, or anything of that kind. If they had those figures before them it would be of value. Some reference had been made to the charge for baths and water-closets, and he agreed it was most desirable that the charge should be reduced or withdrawn altogether; but one could not help seeing that the corporation had been most successful, from the financial point of view, in the conduct of these works, because to be able to carry on the waterworks for a charge of only 5 per cent on the rateable value, and to hand over to the relief of the rates a sum equivalent to 2d. in the £, showed that the works were well constructed and economically managed. Although that charge was put on the domestic economy of the house, still the total charge to the ratepayer was not a high one, and that must be so when one bore in mind that the great majority of the houses in Bridlington were houses which were let for apartments and boarding-houses, and therefore the water was used by the floating population as well as the resident population.

Dr. H. T. Calvert (West Riding Rivers Board) observed that the water supply of Bridlington appeared to be derived from a well in the chalk and to be rather hard, and he would like to know whether the corporation had taken into consideration the question of softening the water. He had figured out what it would mean in the matter of the saving of soap. The removal of every degree of hardness corresponded, roughly, to a saving of soap of about 1 lb. per 1,000 gallons. The present figure was about 15 deg., which could be reduced to 2 deg. by treatment with lime. That would mean a considerable saving in soap. He would like to know whether any difficulties had been experienced as a result of growths or corrosion in the pipes. That was a matter which was receiving more attention now than it did a few years ago. Everything previously had been lumped under the heading of corrosion, but much of the trouble met with had been shown to be due to growths. The question, he noticed, had recently had the attention of the Institution of Water Engineers. It was undoubtedly a very important question, and he would be glad if Councillor Charlesworth would state whether any difficulties had arisen, or were likely to arise, in Bridlington.

Mr. J. P. Wakeford (Wakefield) said he desired to thank the members for electing him as hon. district secretary for the coming year, and to assure them that it would be his endeavour to make the district a pronounced success. He wished to thank Mr. Matthews and Councillor Charlesworth for their interesting and instructive papers, and he heartily congratulated Mr. Matthews on being the engineer to an authority who were able to keep their rates at 6s. 4d. in the £. With regard to private street works, were the streets to which he referred 36 ft. wide; also, did the price for improvement named include any proportion of the cost of the sewers, and was any charge made for supervision under the Private Street Works Act? With regard to the automatic flushing tanks for the sewers, did Mr. Matthews find these satisfactory? His own experience had been that they were unreliable in their action, and he had never found a tank that would fulfil the duties claimed for it. As regarded lampholes on sewers, he was rather opposed to the use of these, and preferred manholes. Proceeding, he asked whether the application of the cold tar was satisfactory. No doubt tar treatment prolonged the life of the roads, but his experience of the work was that it was satisfactory only so long as the traffic was not excessive. He would like to know also the reason for the preference for artificial flags, considering the price of York stone was no greater. The appearance was better, of course, and he would make use of them himself provided they were not likely to be disturbed, but in a manufacturing town, where they were constantly being lifted, they were liable to sustain damage. The consumption of water in Bridlington—43 gallons per head per day—seemed excessive, having regard to the fact that there

were no manufacturers or large trades in the town. They were not told whether Deacon meters were in use, but he could not help thinking a great amount of this was made up of preventible waste. He had had an experience of the use of the Deacon meter, and he had found that they enabled a saving up to 40 per cent to be made.

Mr. John F. Smillie (Tynemouth) said that was his first visit to Bridlington, and he therefore spoke with newly formed impressions of the town. He congratulated the mayor and corporation on the daring enterprise they had shown in connection with the municipal works, and on having such an exemplary officer to assist them in carrying out their duties. Bridlington was to be congratulated both on its corporation and its staff of officials. He had been struck by the extremely low cost at which the streets were constructed—namely 4s. 6d. per lineal foot of frontage. He did not know how the work was done for the money. Of course, Bridlington had gone in for a large quantity of tarred footpaths, but having regard to the frequency with which these had to be renewed—every three years—he suggested that it would be more economical in the end to adopt a more expensive form of paving. Cement concrete footpaths laid *in situ* appealed to him more, and he had found that these laid in panels not more than 3 ft. square had a life in residential districts of twenty years. He would like to know, in connection with the matter of the application of tar to macadam roads, whether Mr. Matthews found the application of cold tar successful. He had tried both hot and cold tar, but the latter had not given satisfaction. On the other hand, hot tar, well rolled in, had preserved the life of the road considerably. But he had not found tar in itself generally successful, and, as a rule, he had used a small quantity of pitch with it. Tar, as it came from the gasworks, became very soft, and was likely to cause damage to light wearing apparel, but that could be avoided by the addition of a little pitch, say in the proportion of 20 lb. to each 40-gallon barrel of tar, although the quantity would largely depend on the nature of the tar and the experience of the men engaged in carrying out the work. He congratulated Bridlington on its sea defence works, and it was pleasing to know that these had stood for forty years without any appreciable repair having been necessary. Mr. Matthews had referred to the contours of the walls and the material used. He (the speaker) had had experience of similar works in which cement concrete blocks had been employed, the manufacture of these blocks providing work for the unemployed. The blocks were cast hollow, and were braced together with wire rods, the whole being afterwards rendered monolithic by the cavities being filled with cement. That work had stood successfully through two winters. The whole of the parapet wall, including not merely the standards, but the rails as well, were constructed of ferro-concrete, though few people who saw them realised the nature of the material. In spite of the action of the large amount of shingle which came in contact with the base of the wall, the cement-concrete blocks had not deteriorated, and he thought it was a work that would require no further attention at his hands. He was [illegible] worth for the paper which he had submitted to the meeting, and was glad to see a member of a public body display such interest in their proceedings. Bridlington was to be congratulated on the success of its water undertaking, and particularly on the low charge which was made for water, in spite of the extravagant figure which was paid to the company from which the works were purchased and the fact that they contributed something to the relief of the rates. The [illegible] extended the works as the corporation had done. The consumption of water in Bridlington had struck him as being somewhat remarkable, and the corporation would, if the population continued to increase, have one day to consider how the figure could be decreased. A decrease of at least 30 or 40 per cent could be effected by a proper system of surveillance, and the people would still be very well supplied.

Mr. W. H. Smith (Scarborough) said that, as one who had had some little experience of various types of sea walls, he quite endorsed what Mr. Matthews had said on the question of the stepped face. His experience at Scarborough had been that there was nothing like the amount of scour on such a wall as there was on a curved face. The matter of the stone that was used was one for each place to settle for itself. He had some concrete block walls in Scarborough which had been up [illegible] years. Mr. Matthews had used cold tar for the tar-painting of roads. His predecessor started the practice, and he had seen no reason for making any change, the results having been most excellent. But the tar must be applied in a suitable way. The surface of the road must be absolutely dry, and warm weather was required for the work. When it came to tar-painting an ordinary macadam road, however, he quite agreed that boiled tar gave a better result. In making a macadam road he used a mixture of stone, dust, tar and fine ashes, grouting the surface of the roadway after it had been dry rolled with that mixture, and following on the next year with hot tar painting. The result obtained from that method was excellent. Mr. Smith added that he would like to know the amount paid to the electricity department by the street lighting department for current supplied to them, as it would be interesting to see whether the former were in any way subsidised by the latter department.

Mr. J. A. Iveson (Scarborough Rural) said he could support the observations of the last speaker as to road making.

Mr. W. E. H. Burton (Wakefield) inquired whether Mr. Matthews had made any provision for expansion of the roof covering on the lavatories he had described.

The President, in closing the discussion, said if he might offer one suggestion he would like to express the hope that the corporation of Bridlington would at an early date take into consideration the provision of a refuse destructor, a most important item, not only in a town of that character, but in every town in the country. It might not be common knowledge how deeply Mr. Matthews had interested himself in the problem of sea defence. He had given the closest attention to the question of the damage to the coast in that part, and the paper which he had read before the Institution of Civil Engineers was one of considerable importance and worth. He was quite in agreement with him in the opinion he had expressed in that paper that it was quite time the Government took in hand some portion of the work, for it seemed a great hardship that towns like Bridlington should have the whole expense to bear. Concluding his remarks, the president said he did not think they ought to forget, in speaking of the satisfactory position of Bridlington in the matter of sanitation and so forth, the valuable work of the medical officer and sanitary officers. They did much to keep down the death-rate and generally in administering to the welfare of the town.

The vote of thanks was carried.

Mr. Matthews said he was delighted there had been such a good discussion. The points raised were of great interest. He would like to thank the members of the North-Eastern district for the great honour they had done him in electing him as one of their two representatives to serve on the council of the institution, his colleague being Mr. E. B. Martin, borough engineer of Rotherham. He greatly appreciated the honour and would do all he could in the interests of the district. Mr. Massie had referred to the small number of empty houses in Bridlington. That state of affairs was very gratifying. At the present time there were about forty houses in course of erection, and plans for twenty were passed in the previous month. They had three screening chambers in the town; the sludge fell into a sump and never got into the sea, the material being disposed of to farmers, who were willing to take as much as could be supplied for their land. He admitted that the lack of accommodation at the town hall greatly hampered the officials of the corporation. He himself had no private office at all, but it was his hope the next time they visited Bridlington to be able to show them new municipal offices. The stepped face type of sea wall was, he was sure, the best, and he had come to that conclusion after inspecting most of the sea walls in this country and many on the Continent. With regard to the tarring of the roads, they put the tar on cold, but, as had been pointed out, it was advisable to choose suitable weather for the carrying out of the work. When they put the tar on an ordinary macadam road they heated the tar—but not always then. They were fortunate in getting the periods mentioned for the repayment of the loan for the ferro-concrete work, having regard to the apparent disfavour with which the Local Government Board looked upon the material. It was the first instance on record of the board having granted so long a period for repayment of a loan for such work, and he wished every engineer to know of it. They had not yet received a reply from the county council with regard to the tar-spraying machine. They had

several miles of roads outside the town for which they received nothing from the county council, and were hopeful that the reply, when eventually it was received, would be a favourable one. They obtained their tar from the local gasworks at the price of 9s. per 40 gallons cask. With regard to the housing scheme, the estimate included land, drainage, formation of footpaths, and so forth, and the council had unanimously approved of the project. Mr. Silcock had referred to the favourable condition of the town as regarded sewerage; the whole of the town fell towards the sea, and he had had no difficulty in that connection. Since the erection of the groynes on the north foreshore some years ago they had accumulated 2,000,000 or 3,000,000 more tons of sand than before. It would have been fatal to have built the sea walls without groynes. Nothing was allowed for sewer works in the price of 4s. 6d. mentioned in connection with private streets. The automatic flushing tanks worked satisfactorily, seldom getting out of order. They did not often put lampholes on their sewers. With reference to the artificial flags, they found them as good now in streets of heavy traffic as when they were first put down. They could be cut more easily to go round corners, and he very much preferred them to Yorkshire flags—which cost the same to lay. They had not done much in the way of concrete *in situ* footpaths, so he could offer no comparison. They did not add pitch to their tar. In regard to the roof coverings mentioned, they had found that where the roofs constructed of ferro-concrete were covered with Limmer asphalt they were absolutely watertight, but it was not so where ordinary steel joists and concrete were employed. He hoped to be able to show them a refuse destructor on the occasion of their next visit.

Mr. Charlesworth, in acknowledging the vote of thanks, said he hoped that the precedent he had set in reading a paper before the Institution would be followed in other towns they visited. The water charges for baths and water-closets were undoubtedly high, but it was the intention of the corporation to reduce them. As to back dividends, the company were paying up to 15 per cent; there was no question they were riding for a fall, and were taking out all they could. The question of a water softening plant had been discussed, but Yorkshire people strongly objected to the water being "doctored," and that was one reason why they had not installed one. But the water could be softened by boiling, which would render it practically the same as Leeds water. Several speakers had referred to the question of the consumption. He had been a strong advocate for a reduction of that, and he had been glad to hear what had been said. Without doubt they would have to reduce it, for it was far in excess of what it should be. Current was being supplied by the Electricity Department for lighting at cost price, and there was no subsidising such as had been suggested.

Since the meeting Mr. Matthews has prepared the following reply to Mr. Brodie's communication:—

In reply to the points raised in Mr. Brodie's letter, I would state that we are steadily increasing the percentage of water-closets at Bridlington. Water-closets have to be put in to all new houses, and we hope that the time is not far distant when we shall be able to say that we have no sanitary conveniences other than water-closets in the town. As to the screening arrangements for the sewage, this has already been dealt with in the reply given to one of the members of the institution who raised the point at the meeting. The hardness of the water is dealt with in Mr. Councillor Charlesworth's reply. As to the intensity of traffic on our tar-macadam roads, roads such as Cross-street, Bridge-street, and the Promenade are subject to a great deal of traffic, but none of it is what one might call heavy traffic, as would be found in an inland manufacturing town, for example; probably the heaviest loads that would pass over these roads would be loaded furniture vans and station rullies heavily loaded. As to the cost of private streets, this has already been dealt with in my reply to Mr. Wakeford's comments on the paper. As to the durability of Bramley Fall rock-faced stone, while granite or basalt, as I have said in my paper, are preferable for the facing of a sea wall, they are both considerably more expensive than Bramley Fall stone. The old Prince's Parade sea-wall at Bridlington, constructed nearly forty years ago, has needed no repairs, and has the appearance of lasting a century. I still adhere to my opinion that a stepped-face wall is the best type to construct, for the reasons already set out in my paper. As to Mr. Brodie's remarks respecting groynes, I scarcely agree with him that these upon a foreshore are a nuisance; the seventeen that we have put down upon our north foreshore, so far from being a nuisance, are a great convenience to the visitors, who use the low timber groynes as seats, and on some of these groynes in the height of the season it is difficult to find a vacant seat, a photograph which I showed to the members in the council chamber well illustrating this. As to tree planting in streets, Mr. Crofts, our town's gardener, informs me that he does find difficulty, especially on the sea front, in inducing the trees to take root. I thank Mr. Brodie for his useful criticism of my paper.

WEST MIDLAND DISTRICT MEETING AT STOURBRIDGE.

The last meeting of the Institution of Municipal and County Engineers held during Mr. Greatorex's term as president took place on Saturday last at Stourbridge. For a Midland gathering the attendance was considerably below the average, but the proceedings were none the less successful, an excellent—if somewhat brief—discussion following the presentation of the three papers which had been prepared for consideration, and the remainder of the day being devoted to an interesting round of visits. The meeting took place in the council chamber of the town hall, Mr. A. D. Greatorex, the president, in the chair, and others present including Messrs. J. S. Pickering (Chelmsford), Chas. E. Fox (Bromsgrove Rural), W. Ballard (Birmingham), C. E. Lawton (Birmingham), A. J. Dickinson (Redditch), S. Douglas (Kenilworth), H. Richardson (hon. district secretary, Handsworth), J. D. Barr (Bromyard), H. J. Coleby (Atherstone), W. Fiddian (Stourbridge), W. O. Thorp (Malvern), F. G. Beaumont (Wolverhampton), F. W. Richardson (Westminster), J. A. Spreckley (Ludlow), C. F. Gettings (Worcester), H. S. Harvey (Evesham), J. L. Harpur (Brierley Hill), members; T. Wooldridge (London), J. Hobley (Stourbridge), W. R. Kelleck (Stourbridge), W. V. Wallens (Kidderminster), W. S. Wilson (Kenilworth), J. Hammond (Stourbridge), W. B. Cleverley (Stourbridge), C. H. Webb (Stourbridge), A. Reed (Stourbridge), J. W. Robinson (Atherstone), B. F. Mason (Stourbridge), H. E. Folkes (Stourbridge), W. J. E. Baker (Malvern), J. V. Moon (Wolverhampton), E. W. Bloomfield (Oakham), W. H. Wright (Stourbridge), A. G. Taylor (West Bromwich), visitors.

The Chairman of the District Council extended a cordial welcome to the members, and said he hoped their visit would be a very interesting one, and that they would go from Stourbridge with very pleasant recollections.

The President (Mr. A. D. Greatorex), on behalf of the institution, thanked the chairman for his kind welcome to the members of the institution. That was the last district meeting during his year of office, but though the last, it was nevertheless one that gave him a great deal of pleasure to attend, particularly as his friend Mr. Woodward, their surveyor, was one of his assistants many years ago, and he knew the good work he had done and the efforts he had made to assist the council in bringing everything up to date. He felt that they would see works that had been well carried out. He trusted they would obtain their incorporation and become a borough, and be a progressive borough. He would not like to sit down without referring to the excellent work which had been done in the past by one of their members (Mr. Jones). He knew Mr. Jones very well, and the work he had done for Stourbridge, which had been of very great benefit to the town.

Mr. H. Richardson (Handsworth) read the minutes of the Nuneaton meeting, which were confirmed.

Mr. Richardson then announced letters of apology from Mr. A. T. Davis (Shropshire), who has been indisposed for a considerable time, Mr. G. J. Shepherd (Kidderminster), Mr. V. Barton (Stoke-on-Trent), and Mr. A. T. Stilgoe (Birmingham).

The meeting afterward proceeded to the discussion of papers, the first on the list being

SOME MUNICIPAL WORKS AT STOURBRIDGE.

By F. Woodward,

Surveyor and Architect to the Urban District Council.

Stourbridge obviously derives its present name from the bridge over the river Stour. The earliest mention of the town is in a deed of 1275, where it is described as "Sturbrigge." Stourbridge town is the head of a

union, a petty sessional division and County Court district, in the ancient parish of Oldswinford, in the Mid or Droitwich Division of Worcester. It is situated on the green borderland of the Black Country; on the north and east are the mining and manufacturing industries of South Staffordshire and East Worcestershire; on the south and west, attractive residential districts. It is separated from Staffordshire by the river Stour, which forms its northern boundary. In 1894 Wollaston was joined to Stourbridge, and the following year Upper Swinford also. The district has both a residential and industrial character. The chief manufactures in the district are (Messrs. J. Bradley & Co.) branded bar iron, where the first locomotive used in America, the "Stourbridge Lion," was made,

From photo by [*C. G. Mason, Stourbridge.*

MR. F. WOODWARD.

[Mr Woodward is a native of West Bromwich, and was articled to the late Alderman T. Rollason, then a surveyor of that town. In 1890 he became an assistant under Messrs. Pincher & Long, architects and surveyors of that town, and in 1893 was appointed assistant borough surveyor of West Bromwich under the late Mr J. T. Eayrs and the present borough surveyor, Mr. A. D. Greatorex. In 1899 he was appointed to his present position as town surveyor and architect to the Urban District Council of Stourbridge. Mr. Woodward was elected a member of the Institution of Municipal and County Engineers in 1899.]

fireclay goods, including glazed bricks and baths, flint and other glass, leather and fellmongery goods, buckets and other galvanised sheet-iron articles, chains, anvils, vices, &c.

King Edward VI. Grammar School in the town was founded by Royal Charter in 1552 at the request of the inhabitants of the town of Stourbridge. Since that date it has been entirely rebuilt. Considerable extensions have been made during the last few years, which has provided accommodation for over 300 boys. It is richly endowed, and one of the first in the county. The town and residential portion is on the new red sandstone formation, the other portion having a brick-clay surface overlying the coal and fire-clay measures.

GENERAL STATISTICS.

The estimated population of the urban district is 17,341; area, 1,920 acres.

Population per acre, Stourbridge ...	...	23·78
" " " Wollaston ...	...	6·05
" " " Upper Swinford	...	3·49
Entire district	...	9·03
Rateable value	...	£67,017
Approximate number of houses ..	...	4,250
Death rate, 1911	...	13·09
Birth rate, 1911	...	25·99

Rates.—District rates, Stourbridge, 3s. 10d.; Wollaston and Upper Swinford, 3s. 6d. Poor rate for Stourbridge, 5s.; Wollaston and Upper Swinford, 4s. 6d. Totals, Stourbridge, 8s. 10d.; Wollaston and Upper Swinford, 8s. A 1d. rate brings in £230.

ROADS.

There are 6 miles of main roads maintained by the council. The total annual cost is about £1,250 for ordinary maintenance and scavenging. The county council make an annual payment towards the cost. The town roads are 16 miles in length, and cost about £1,200 a year in maintenance. The main roads are repaired chiefly with Rowley and Clee Hill granite and the district mainly with broken slag.

Construction and Tar-spraying.—The council have experimented with Rocmac, Tarmac and tar-grouting with success. The council have decided to extend the use of Tarmac in future where the gradients will allow. For some years before tar-painting was done the chief main roads had become unbearable owing to the dust nuisance; liberal street watering did not abate the nuisance. For several years the chief roads have been tar-painted. Last year 45,000 yds. were done by machine, 8,100 yds. with bituminous compound, 12,800 yds. with refined, and 24,100 yds. with crude tar. The cost per yard was—bituminous, 2·037d.; refined, 0·872d.; crude, 0·568d. The covering capacity was—bituminous, 4¾ yds. to the gallon; refined, 7 yds.; and crude, 8 yds. The cost of labour by hand the first year was 0·347d. a yard; by machine, 0·212d. The painting has considerably increased the life of the roads. Potholes have diminished which were caused largely by the constant watering.

STREET IMPROVEMENTS.

Stourbridge, being an old town, has many narrow roads, and thousands of pounds could be spent in purchasing properties for desirable widenings; but, being a comparatively small one, it has to move slowly in this direction. Notwithstanding, the council have during the last three or four years borrowed sums amounting to £5,000 for purchasing properties for street widenings, the chief of which is the Market-street improvement, opposite the town hall, just completed, and the Hemplands and Round-court improvement (in hand), where twenty-six slum cottages have been demolished for the making of a new street. Every opportunity is taken to widen roads, and £3,000 has been spent on this work in various parts of the district out of revenue during the last ten years, and carried out by direct labour. Nearly all the land was given upon condition the council made the road and refenced. During the same period a sum of £6,000 has been borrowed on loan for paving works.

TRAMWAYS.

In 1898 the British Electric Traction Company obtained orders to construct tramways in the urban district under the Dudley and District Light Railways Order and (Extension) Order, and the Kinver Light Railways Order.

Many clauses were obtained for necessary street widenings, which were paid partly by the company and partly by the county and urban councils. The work of widening was carried out by the urban council and recharged to the parties concerned.

There are two miles of double track and one mile of single track in the urban district; 87-lb. grooved rails were used, laid upon a bed of 6-in. cement concrete. Between the rails, and for 18 in. on either side, it is paved with 5-in. by 3-in. and 5-in. by 4-in. granite setts, the whole being maintained by the tram company.

The High-street portion was too narrow for a single track up the centre, and a double line was laid as near to the kerb as possible. It is laid on 6-in. cement concrete, and paved the full width of carriageway with Jarrah wood blocks, and maintained by the council and recharged to the company under an agreement. It is now only used for running the cars through to the Lye. At first the company started running through from Dudley; but, owing to obstructions by vehicles unloading, &c., and only one tramcar being allowed in the street at one time, the company found it impossible to continue the service owing to delays, and the terminus is now by the town clock, for which the High-street traders are very grateful.

Kinver Light Railway.—This railway is about 4½ miles in length, about 1 mile being laid as ordinary tramway on the main road in the urban district, and the remainder in the Seisdon rural district, Staffordshire, being laid at the side of the main road and on a private right of way through the fields. The construction of the latter part consists of 4½-in. girder rails dogged to transverse sleepers. Power is supplied from a generating station situated at Hart's Hill, about 3½ miles from Stourbridge. This station is equipped with three 100 k.w. d.c. generating sets through a battery sub-station at Amblecote, and is conducted to the cars by means of the usual overhead trolley. The Amblecote battery consists of 256 Tudor cells, and is for the purpose of keeping a steady load on the generators at Hart's Hill and also to improve the average voltage on the trolley wires—that is, at times when the load is heavy, the battery discharges and helps the generators, and when few cars are run-

ning the generators then charge the battery. At times of heavy traffic a Diesel generating set, situated on the Lye route, is also put into service. This set is of 100 kw. capacity, and for Bank Holiday loads power can also be taken from the Midland Electric Corporation power station, Ocker Hill, through a 150 kw. generator situated in Amblecote sub-station. Sixteen capable of destroying 30 tons in twenty-four hours. The average daily quantity consumed is 22 tons. The furnaces are of the usual Horsfall type, erected at that time with back feed. The furnace gases pass through a Lancashire boiler on their way to the chimney shaft, and also through a Horsfall centrifugal dust catcher. The stack is 120 ft. high, and the whole

(Plate 1.)

thousand people have been carried on this light railway on a Bank Holiday. The author is indebted to Mr. John Ward, traffic manager to the company for the above.

REFUSE DESTRUCTOR.

The destructor plant was erected in 1904. It consists of three furnaces each with 20 ft. grate area, plant is housed in substantial brick buildings. The site is 3 acres in extent, and is used for depositing the clinker and ash. The total cost was £5,325, including engineer's house, but of this sum £1,000 was spent for electric light purposes.

After the abandonment of the electric light scheme it was decided to carry a steam main a distance of

120 yds., for supplying the engines at the sewage pumping station with the surplus steam. The steam generated mainly goes to supply the steam jets for the forced draught, the surplus being responsible for pumping one-third of the sewage. This quantity does not come up to expectations owing to the supply being very intermittent. The total tonnage destroyed per annum is 5,500. The cost last year per ton for destroying, including all labour, upkeep, and rates and taxes, was 18·940d.

PUBLIC BATHS.

The public baths were erected in 1901, from the author's designs, at a total cost of £5,133, including water supply and engineer's house. Twenty-seven years' sanction was obtained for the erection and five years for the water supply. The cost, excluding site and water supply, but including boilers and heating arrangement, was 5½d. per foot cube. The boiler-house, laundry, pump-room and stores are situated in the basement. The swimming hall is 93 ft. by 46 ft., and the pond 75 ft. by 28 ft. Dressing-boxes are provided on two sides, and 5-ft. gangways, except at the deep end of bath, which is 12 ft. Galleries are provided over the dressing-boxes, and are approached by two staircases each side of main entrance. In connection with the swimming bath is a lavatory, soap bath, and shower, and a committee room leading from the gallery. The swimming-bath walls were constructed in brickwork in cement, having a ¾-in. rendering of cement in two layers before the glazed lining was put in. The bottom was constructed with 9-in. cement concrete and rendered as walls before laying glazed-brick bottom. The pond has been absolutely watertight from the first. There are two entrances for men and women. Between each corridor entrance are situated the pay office and waiting-room, and at the side of each entrance are six slipper baths for men and three for women. The interior walls of swimming hall and slipper baths are faced with Ruabon best facing bricks relieved with buff cornice. The roofs are matchboarded, and top lights provided with opening casements. The front elevation is faced with best local facings and relieved with buff terra-cotta dressings. The heating was carried out by Messrs. Jones & Attwood, of Stourbridge, on the low-pressure, hot-water circulating system.

The cost of this portion of the work was £350, which included connections and fittings to slipper baths, boilers and drying coils. This sum is included in the total amount given above. The system is simple and much cheaper than steam in first cost and maintenance. In our case the superintendent attends to the whole, except in the swimming season, when a youth is engaged.

The author is of opinion that for small baths this system is very satisfactory, and much more economical than steam, and occupies very little space. A powerful boiler is fixed below the level of the bath, and circulates through galvanised pipes from the boiler to the bath. The flow pipes are connected at the shallow end and near the bottom of the bath, returning from the deep end and from the bottom of the bath. A separate boiler is provided for the slipper baths and heating pipes, so that the upkeep is very small when the swimming bath is closed. The annual water consumption is approximately 3,500,000 gallons for the whole of the establishment. The fuel consumption is 110 tons, or about 31,818 gallons of water per ton of fuel used. The required temperature of 70 deg. is easily maintained. The water for filling the pond is pumped and heated through the boiler, and no complaints are received owing to bad circulation.

The borehole is 10 in. diameter, and carried through the new red sandstone to a depth of 250 ft. The borehole is lined to a depth of 60 ft. The pump is one of C. Islers & Co.'s improved deep-well pumps, capable of yielding 6,500 gallons per hour. Ample supply has always been obtained, and as the five years' loan charges are paid off, the cost of water is now under 1d. per 1,000 gallons. The average annual upkeep of the baths, including wages, rates and taxes, and repairs, &c., during the last seven years was £330; annual charges for repayment of loans, £260; average receipts, £250; average cost per annum to the ratepayers equals a 1½d. rate.

FREE LIBRARY, TECHNICAL AND GIRLS' SECONDARY SCHOOLS.

These buildings were erected in 1904 from the author's designs, and extended three years ago, at a total cost of £14,000. Mr. Carnegie contributed £3,700 towards the cost of the free library portion. The cubical contents are 465,628, which works out at 6½d. per cube foot.

The following is a brief description of the building:—

Basement.—Carpenter's shop, 39 ft. by 22 ft.; blacksmith's shop, 40 ft. by 21 ft.; recreation-room, 40 ft. by 21 ft.; and dining-room for girls, 40 ft. by 38 ft., with heating apparatus and stores.

Ground Floor.—Free library, consisting of main entrance and corridor, 47 ft. by 8 ft.; newsroom, 40 ft. by 38 ft.; ladies' room, 17 ft. by 13 ft.; magazine-room, 40 ft. by 21 ft.; lending library, 41 ft. by 25 ft. (open access system), librarian's room and stores. Approached from a separate entrance are two caretakers' rooms; modelling-room, 26 ft. by 21 ft.; cast-room, 21 ft. by 12 ft.; cookery-room, 26 ft. by 21 ft.; and store.

First Floor.—School of Art—namely: Elementary room, 43 ft. by 21 ft.; advanced room, 44 ft. by 21 ft. (which can be converted into one room, 87 ft. by 21 ft., by folding partition); life room, 23 ft. by 21 ft.; painting and antique room, 26 ft. by 21 ft.; mechanical drawing room, 38 ft. by 21 ft.; with secretary's room, lavatories and cloak-rooms.

Second Floor.—Girls' secondary school—namely: Five classrooms, each 23 ft. by 21 ft.; chemistry room, 26 ft. by 26 ft., with balance room: lecture theatre, 38 ft. by 21 ft., with lavatories, cloak-rooms, and teachers' rooms.

Two staircases are provided at each end of the building on each floor. The corridors and staircases are constructed in concrete, and the floors of all rooms are made sound-proof. All walls are plastered throughout except in the basement. There are 4,660 cub. ft. of terra-cotta as enriched work to the elevations, which was supplied by the Ketley Brick Company, of Brierley Hill.

TAR-MACADAM PLANT.

A plant for heating and mixing tar-macadam has just been erected at the council's depot at a total cost of £350. The heating arrangement consists of a 2-ft. revolving cylinder 10 ft. long inside a 3-ft. steel shell. The whole is built up on brickwork with an ordinary furnace. The heat passes round the cylinder and shell, and returns through the bottom of shell and round to chimney. This work, together with the mixer, was supplied by Messrs. Thompson & Southwick, of Tamworth. The power is obtained from a 5½ b.h.p. gas engine. The whole is covered with a galvanised iron shed, 51 ft. by 20 ft. It is estimated that with this plant 40 to 50 tons a day can be heated and mixed by three men.

PLEASURE GARDENS.

In 1903 the council purchased, at a cost of £2 000, 4 acres of land out of gas profits, for the purpose of cutting a new street and providing pleasure gardens. The author prepared designs for the laying out of about 3 acres, which was done by contract at a cost of about £800, provided by public subscriptions. The council have now under consideration the purchase of some 20 acres of land for a park, as the present grounds are not large enough.

PUBLIC MORTUARY.

A public mortuary was erected in 1909 out of revenue from the author's design, on land adjoining the baths, at a cost of £225. It consists of a room 18 ft. by 18 ft., fitted up for post-mortem, and open entrance hall (where jury can view the body instead of in mortuary), and enclosed yard.

SEWAGE DISPOSAL WORKS.

In 1891 a meeting of the association was held at Stourbridge, when Mr. Fiddian gave a paper on the sewage disposal works, so that it is only necessary to give a brief description. The disposal of the sewage is dealt with by the Stourbridge Main Drainage Board. The works comprise main sewers converging at a pumping station, from which the sewage is conveyed through a rising main to a farm about 2 miles distant, and there dealt with by broad irrigation. The lift is about 150 ft. The area of the farm is 296 acres, of which 275 acres is let to a tenant at a rental of about £250 per annum. The subsoil consists of from 5 ft. to 8 ft. of loam sand with a few pebbles overlaying the rock of the new red sandstone formation. The total quantity of sewage pumped last year was 344,000,000 gallons. The area of board's district is 2 574 acres, with a population of 20 500. Outside population served, 6,000, in addition. The quantity of fellmongers' waste fluids in the sewage is estimated at one-eighth of total. The capital outlay was £37 000, the bulk of which is nearly discharged. The annual expenditure is £2,700. The whole of the system was carried out about twenty-seven years ago, on re-

port of and to plans prepared by the author's predecessor, Mr. William Fiddian, who still holds the posi-

flushed weekly by twenty-five automatic flushing chambers and by car'. They were laid by Mr. Fiddian

tion of engineer to the board. There are twenty miles of collecting sewers in the urban district, which are

in 1885, at a cost of £11,000. These loans, together with the council's portion of the Drainage Board

loans, will be paid off in three years, equal to about a 7d. rate. The surface water is dealt with separately as far as possible, the old sewers being utilised for this purpose. The system of ventilation is by surface grids, but these have been replaced with solid ones where complaints have arisen from time to time, and shafts erected. Three Webb's ventilating lamps have been erected, which are partly lit all day, for which an additional £1 a year is paid for each lamp.

PRIVY CONVERSION.

During the last few years about 1,100 privies have been converted into water-closets, and there are now not more than half a dozen privies in the urban district. Credit is due to our sanitary inspector for obtaining this result. Under sec. 39, sub-sec. 4, of the Public Health Act Amendment Act, 1907, local authorities have to contribute one-half the cost for these conversions, but, in the author's opinion, sufficient powers exist without resorting to this Act, and I cannot think that many local authorities will put into force this section spending ratepayers' money improving private property.

CLEANSING OF ASHPITS, ETC.

Some eighteen months ago this work was transferred from the sanitary to the author's department for economical reasons. A considerable saving in horse hire has been made on the two departments due to one helping the other; 5,360 loads were removed in 1911, at a cost of £580, including establishment charges. About one-half the houses are provided with ashbins, which are emptied weekly.

UNDERGROUND CONVENIENCE.

A small convenience has been erected near the free library, at a cost of £250 out of loan. It consists of a four-stall urinal and three penny-in-the-slot water-closets. Without an attendant the water-closet locks get abused, and considerable damage is done at times.

STREET LIGHTING.

The 22 miles of roads are well lighted with 545 lamps, at a cost of £1,500 a year, which sum includes all maintenance. All are fitted with incandescent burners and lighted all the year round. The lamps are as follows:—

475	one light	100	candle-power
1	four ,,	400	,, ,,
2	three ,,	900	,, ,,
1	three ,,	300	,, ,,
66	two ,,	200	,, ,,

The gasworks (which include large urban and rural areas outside the council area) belong to Stourbridge Council. The works are situated outside the urban area in the adjoining county of Stafford, and are a very valuable asset to the town. Two-thirds of the profits are devoted to the relief of the rates, equal to an 8d. rate.

TOWN HALL OFFICES.

The town hall was erected on part of the Market Hall site in 1887, at a cost of £4,000, by public subscription, as a Jubilee memorial to the late Queen. It will hold about 1,200 persons. The architect was Mr. T. Robinson, of Stourbridge. The Town Commissioners erected in conjunction with the hall, public offices, fire station and council chamber, at a cost of £2,400.

MARKETS.

History states that the original town hall or market house was taken down in 1773, for the necessary purpose of widening the carriageway in the centre of the town. A new market hall was erected and opened in 1827, at a cost of £20,000, including old houses and the building of two shops. Unfortunately no provision appeared to have been made in the Act relating to the old market hall for the repayment of the loan obtained for its erection, and this omission was only rectified by an Act in 1891. The existing market hall has just been entirely renovated, at a cost of £850, under the author's supervision.

FIRE BRIGADE.

The council provide accommodation for fire brigade in the town hall buildings. The brigade is a voluntary one, but supported by the urban council, who pay duty-man's wages and house rent, and for occasional hose, &c.; otherwise the brigade is supported by voluntary contribution.

INCORPORATION.

In 1883 a strong effort was made to obtain a Charter of Incorporation for the town, to include some of the adjacent districts, but the scheme collapsed owing to strong outside opposition. It has again been before the public during the last eighteen months, and has progressed so far that a petition has been forwarded to the Privy Council. The petitioners are seeking to obtain a Charter of Incorporation for its present area before considering any proposal for including some of the adjacent districts.

INFECTIOUS DISEASES HOSPITAL.

The Stourbridge and Halesowen Hospital Committee comprises the areas of Stourbridge, Lye, and Wollescote and Halesowen, with a population of about 50,000. The hospital is situated about 4 miles from Stourbridge. It was built in 1899, at a cost of £10,000, and has accommodation for forty-eight beds. The architects were Mr. A. T. Butler and Mr. H. T. Hare. A small-pox hospital has just been erected near, with accommodation for eight beds.

CEMETERY.

About 11 acres of land was purchased in 1876 for the purpose of a public cemetery. The total cost of the work was £8,500.

WATERWORKS.

The town is supplied with water by the Stourbridge and District Water Board. The works have during the last three years been purchased from the company by four local authorities within its area. They are explained in Mr. Fiddian's paper, the consulting engineer to the board. The engineer and manager to the Water Board is Mr. W. B. Cleverly.

HOUSING AND TOWN PLANNING ACT, 1909.

The council have adopted this Act, and the committee have the matter under consideration. As the future development of the town will be on the residential side, I am hoping that the council will shortly see its importance. The author has already planned out certain areas.

[Papers by Mr. Wm. Fiddian and Mr. C. H. Webb, dealing with the Stourbridge and District Water Board's undertaking and the Stourbridge gasworks respectively, are reproduced on another page of this issue.]

DISCUSSION OF PAPERS.

Mr. J. S. PICKERING (Cheltenham) proposed a vote of thanks to the authors of the papers. He had known Mr. Woodward for a number of years; he was a member of the Institution who was very greatly respected. Mr. Fiddian was an older member still; he had known him many years, and he was glad to have the opportunity of meeting him again to see some of his work. The papers gave one the impression of a very progressive town. Mr. Woodward's paper was full of interest, almost beyond criticism being a descriptive paper, but it set forth very clearly the work which was being carried out, apparently in so able a manner, by the urban district council. He was greatly surprised to find that the authority there was an urban district council, but he understood steps were being taken to incorporate the town. It appeared to him that probably that step should have been taken long ago. It seemed very desirable in the interests of the ratepayers that a town of this character should seek incorporation, and the fact that the Privy Council had already decided to hold an inquiry was a long step towards the attainment of that very desirable end. He only hoped that they might soon have the pleasure of congratulating them upon the important step they were now about to take. They would no doubt get some opposition. Whenever progressive steps were taken there were always members of the community who seemed to take a pleasure in keeping matters behind. He did not know what opposition there was there; if there was any he hoped it would be very slight, and they would soon attain that status the importance of the town merited. There were only one or two matters in the paper he would like to refer to, more to get information than to criticise. As to the maintenance of the roads, he congratulated Mr. Woodward upon carrying them out at such a small cost. The main roads only cost £200 a mile, and the district roads only £75 a mile. That seemed a very low cost of maintenance. It was due probably to the narrowness of the roads and the low price at which the material was obtained. He would like to ask Mr. Woodward whether that included the tar-painting, which must cost from £30 to £40 per mile. If that was so, the upkeep of the roads was exceedingly small. He noticed that on the main roads two kinds of stone were used Rowley and Clee Hill. He would like to ask why that was—whether one stone was better than the other, or whether it was because of the hills, and one was more slippery than

the other? The council were fortunate in being able to obtain broken slag for their district roads. Certainly it made a cheap road, but whether it was sufficiently substantial with the present traffic he was unable to say. Perhaps Mr. Woodward would be able to say whether these roads were economical, though made up so cheaply. He noticed they were using three kinds of tar—bituminous, refined and crude. Would Mr. Woodward tell them what he found to be the advantages of these different kinds of tar; and whether the cost of bituminous tar made it desirable to use in preference to the cheaper kind? Then he noticed the corporation possessed a modern destructor, but there seemed to be some disappointment as to the quantity of steam that was produced from the refuse, and he was rather surprised to find in reading the paper that the steam mainly went to supply the steam jets. He would like to ask whether "mainly" meant that the greater portion of the steam went for the steam jets? He could not understand it at all, because the makers said that the steam required for forced draught was only from 5 to 10 per cent of that. He did not know whether Mr. Woodward had thought of using a fan instead of the steam jet, as it seemed the most economical form of obtaining a forced draught. He noticed also the steam was carried a distance of 126 yds. Might he ask whether it was superheated, and, if not, was there not a great loss from condensation? The swimming bath water, he understood, was warmed by the circulating system. Mr. Woodward did not give them the size or description of the boiler; he merely called it a powerful boiler. Perhaps he would not mind stating what kind of boiler it was, and also whether galvanised-iron pipes were used for circulation. It would also be interesting, as he gave the cost of warming the water up to 70deg., a ton of coal being used for 30,000 gallons of water, and, assuming that the price of coal was anything from 10s. to 15s. per ton, the cost seemed rather high. He thought the council were to be congratulated in being able to let their sewage farm for a rent of £250 per annum. Although less than £1 an acre seemed low, compared with other farms it was a fair figure, as many other authorities showed a considerable loss on sewage farming. Then he would like to ask whether the Webb lamps which were only partly lit all day were satisfactory; also whether the automatic flushing tanks used on the sewage farm were satisfactory? As to the fire brigade, he noticed it was supported by private subscriptions. He scarcely thought that was a proper system, and as every ratepayer would get the advantage of the brigade, it should be supported out of the rates. Mr. Woodward referred in the latter part of his paper to the Housing and Town Planning Act, and stated that that Act had been adopted by the council. He would remind Mr. Woodward that the Act was not an adoptive one; it was applicable without being specially adopted. Referring to Mr. Fiddian's paper, his description of the method of separating the two waters obtained from the upper and lower stratas was exceedingly interesting. Reading the paper alone, it was rather difficult to follow the method adopted, but since coming into the room he had had the advantage of seeing the diagram on the wall, and the matter was now made perfectly clear. He understood that a number of canvas bags filled with cement were put in in the first instance to fill up the interstices round the plug. He took it that the operation was carried out when the water in the borehole would be somewhere near the surface. It was an unusual practice which had been resorted to there; it had been a great success, and Mr. Fiddian was to be congratulated upon it.

Mr. Sholto Douglas (Kenilworth) said he had great pleasure in seconding the vote of thanks. With a descriptive paper like that of Mr. Woodward's it was difficult to criticise, but there were one or two points on which he would like information. He would be glad to know how much the county council paid towards the maintenance of the main roads, and whether what they contributed was paid by way of a contract extending over three or five years, or whether there was an annual adjustment based on the amount actually expended. He wished to know on how many of the 6 miles of main roads there were tramway tracks. Mr. Woodward was to be congratulated on the low cost of his crude tar-painting. He himself could not do it for less than 1d. or a trifle over. Did the figure of ·568 include dressing? If so, what dressing was used, and what was the cost per ton? He was deeply interested in the question of fellmongers' waste, and an analysis of the waste discharged into the sewer would be useful; also an analysis of the sewage. The cost of street lighting—which worked out at under £2 9s. per lamp—was exceedingly low, especially if the lamps were burning all night. He should be glad to know what was paid to the Gas Committee in this connection. The cost of the cemetery seemed somewhat high, but that was probably in a large measure due to drainage works. As regarded that drainage, perhaps Mr. Woodward would state whether that was treated in any way or discharged straight into the watercourse. With reference to Mr. Webb's paper, he would particularly like to know the cost of the dehydrating plant that had been installed at the gasworks, and the cost of the treated tar as compared with the crude tar.

Mr. A. J. Dickinson (Redditch) asked, in connection with the destructor, what were the number of stokers employed, the wages paid, and the hours worked. There was the inevitable loss recorded on the town's swimming bath, but he did not think the ratepayers would feel altogether sorry about that, for swimming and slipper baths were a boon even if they were a slight burden on the rates. Their bath at Redditch—an open-air one—only managed to pay its way once in about every six years. He would like to know in which months of the year the Stourbridge baths were open, because there was an impression that if they had permanent baths they could keep them open in the winter. His belief was that that was not usually a success. The acquisition of a further 20 acres of land for the purposes of a public park was a good step, and his hope was that the council would be as fortunate as he had been in the price they paid for the ground, the amount he had paid at Redditch being from £50 to £82 per acre. He congratulated the town on possessing the gasworks; the step they had taken in that matter was one in the right direction, and one taken at the right time. His own authority had the opportunity of doing the same thing some years ago, but did not avail themselves of it, and now had an electricity scheme which cost them £1 000 a year out of the rates. A tar dehydrating plant had also been suggested at Redditch, but nothing had yet been done in the matter.

Mr. W. Osborne Thorp (Malvern) remarked upon the low cost of the main roads, and inquired whether that was the amount paid by the county council or the actual cost. If so, was it wholly repaid by the county council, or was it only a proportion, and what was the proportion? His opinion was that all urban councils would be well advised to send in a bill each year and not enter into any contract, for they had found, owing to the increased amount of motor and traction engine traffic, that their bill had been mounting up year after year. They now had in tar-spraying something more satisfactory than the watering of streets, but unfortunately the county council did not contribute anything like a proper proportion of the cost of the work. At Malvern they had been offered only £30, whereas he proposed to spend £250, so that the ratepayers would be called upon to meet a difference of over £200. The cost of tar-spraying at Stourbridge was particularly low. He could not do it under 1d., having to go outside his town for the tar, but at Stourbridge, he presumed, they obtained the material practically at cost price. He would like to know the amount of tar that was used in the tar-mixing plant. At Malvern they did their mixing by hand, and by using 9 gallons of tar to the ton found they were able to get a very satisfactory tar-macadam. At some adjoining quarries they mixed their stone and tar with a tar-mixing plant, and they used 50 per cent more tar. He would like Mr. Woodward's views on the comparative advantages of the two methods. Speaking as the chief officer of the Malvern brigade, he would like to impress on the Stourbridge Council the desirability of taking over the whole of their fire appliances, because when the service was maintained by voluntary subscriptions it was open to a certain amount of abuse, and one never knew what the expense was going to be. Moreover, they had not the same control over the firemen as they had when the brigade was in the hands of the authorities. He would also be glad to have particulars of what the plant consisted of. He noticed the sewage farm was let to a tenant—a rather unusual way of dealing with sewage. Was the tenant responsible for the condition of the effluent? because one knew in cases like that, when crops were down and the season was a wet one, a farmer would not want his crops flooded with storm water. He was glad Mr. Webb had been able to put down the plant he had described, and hoped other authorities would follow his example, because the demand for tar was becoming greater and greater every year. Mr. Webb had made rather a hit at surveyors

on the subject of barrels. He did not think he could blame them, however, for their condition, because railways were not over careful, and they were subject to a good deal of rough usage by the men on the works. He was now supplying steel barrels, and thought it would pay in future to make use of these.

Mr. H. J. COLEBY (Atherstone) asked what the county council contributed towards the maintenance of main roads. He must also congratulate Mr. Woodward on tar-painting with crude tar. He could not do any tar-painting under ·9 of a penny; that included the painting and spreading with fine granite chippings. He would like to know whether this ·568 of a penny included painting and the chippings. With reference to the public baths, it was stated that a loan was granted of twenty-seven years for erection and five years for water supply. He would like to know the reason for the short period for the water supply; did it include the borehole or only the necessary pump and machinery? With reference to Mr. Fiddian's paper, he did not quite agree with Mr. Pickering that the description was hardly full enough. He found very little difficulty, and he was able after carefully reading the paper and the description to construct a sketch which he found was very similar to the drawings exhibited. With reference to the difference in the hardness of the two waters, he would like to ask what strata the top part of the borehole was put down in. He thought the paper only stated that the borehole was put down in the bunter series. If that was the case all the way down it seemed curious that there should be a difference between the upper and lower part of the bunter, or was any part in a different formation, like the Keuper sandstone? That might explain the difference in the hardness of the water. Then he would like to know the rate of boring, and whether he found any difficulty from loose pebbles or hard marl.

Mr. C. F. GETTINGS (Worcester) said, knowing the three gentlemen who had written the papers personally, he would like to add his thanks for their papers, which were very interesting. Particularly he would like to call the attention to the plant which Mr. Webb had laid down in connection with heating the tar. He thought he was to be commended for his enterprise, and if among his colleagues they were to knock their heads together with gas engineers in their respective towns, instead of the gas engineers trying to make the huge profit which some of them had been trying to do, and being satisfied with a reasonable turnover, they would all get a cheaper article, and be much better supplied than at the present time. He personally knew the plant which Mr. Webb had put up, and he had supplied them with a considerable quantity of tar, from which they were getting excellent results. He saw no reason why other towns should not do the same thing. It seemed ridiculous that many places with gasworks should send tar 50 and 60 miles away simply to be treated and come back again, when about half the cost was taken up with carriage. He thought both the companies and the corporations concerned would benefit by it.

Mr. J. A. SPRECKLEY (Ludlow) said he was interested in the question of the main roads, and would be glad to have some further particulars with regard to the figures and the way in which the Worcestershire County Council treated the council. He was afraid that in Shropshire the county council were not over-generous.

The PRESIDENT, in putting the vote of thanks, remarked that the paper of Mr. Woodward was full of interesting detail. When they had had an opportunity of visiting the works they would be struck by the skill which the surveyor had shown in the design of the free library and school buildings. It was not often the surveyor to a public body had the opportunity of designing buildings of that nature, which must remain as a monument to his name, for most of their work disappeared underground. From his knowledge of Mr. Woodward, he could say that he (Mr. Woodward) was not only an engineer but an architect of considerable repute, and they would appreciate what he had done. Stourbridge was to be congratulated on being able to deal with their sewage in such an easy manner as was done. The paper on the gasworks was most interesting to all of them, and he agreed with Mr. Gettings that a great deal more could be done in the direction of the dehydrating of tar, his view being that the material could be cheapened and a great deal more work done if gas engineers would co-operate with those responsible for the construction of highways.

Mr. WOODWARD, in reply, thanked them very much for the way in which they had received his paper. In reply to Mr. Pickering, he thought his first point was with regard to the low cost of maintenance of their by-roads. That was caused by their using a rather cheap material, a local slag, and the bulk of the by-roads having very little traffic.

Mr. PICKERING: What does the slag cost?

Mr. WOODWARD: Three shillings and sixpence per ton.

Mr. PICKERING: On the roads?

Mr. WOODWARD: No, on the wharf; it costs about 4s. 6d. on the road. With regard to the use of Rowley and Clee Hill stone, he had used both for the last twelve months, and had not had time to judge which was the better of the two stones. The Clee Hill cost them 1s. per ton more than the Rowley; it was supposed to make less mud and wear longer. They had always used Rowley stone on their main roads up to the last year or two, practically because it was a local quarry and the traffic was not excessive. With regard to tar-painting and the advantages of using different kinds of tar, his experience had been that bituminous tar for tar-painting was not worth the extra money. It cost more to put on, and during the season was a better looking surface, but in the autumn it had all worn off or turned into mud, just the same as the ordinary crude tar, and as a dust preventive he thought the refined or crude tar was equally as good as the bituminous, and cost considerably less. With regard to the remarks on the destructor, he must say, from the steam point of view, they had been very disappointed with it. It was owing to several causes: the plant was so far away from the pumping station, and they lost pretty well in condensation. They did have a superheater, but some of the tubes leaked so badly and continuously, and they had so much trouble with it, that he took it out a year or two ago, and it had not been put back. He had not found they had done worse since. They had considered the question of doing away with steam blasts and having a fan, and he had thought when they could afford it of going in for that system of draught. With regard to the baths, Mr. Pickering had referred to the circulation of the water and the boiler. It was an ordinary circular boiler, and was quite sufficient for the work. It was natural circulation. With regard to the coal, it was 11s. 6d. per ton. Webb's ventilating lamp they found perfectly satisfactory, when kept partly alight during the daytime. In fact, they had no complaints. Mr. Douglas asked the cost of their main roads. The cost had decreased during the last three years since they commenced tar-painting their roads. The cost given of £1,250 did not include tar-painting and any works on the footpaths; it was simply the maintenance of the carriageways. They had got pretty well all their main roads paved with setts or wood. The High-street was paved the full width of the carriageway, and since that was done it had considerably reduced the cost of maintenance. Several of their main roads were narrow, and, of course, the double tramway tracks took up much of the carriageway, and they had only narrow margins to maintain. The tar was applied by one of Llewellyn & James's machines. The tar-macadam plant had only just been completed, and so he could not tell Mr. Thorp what quantity of tar they used. The cost of their street lighting was about £1,500 a year. In reply to Mr. Dixon as to their destructor wages, they paid the foreman 35s. a week, two men 27s. 6d., and one man 25s. They worked on ten-hour shifts. In reply to Mr. Thorp, he said they did not enter into any contract—they had not done so for years; they submitted their accounts at the end of the year and made the best bargain they could. They got £1,150 from the county for ordinary maintenance, excluding works. Up to this year the county contributed 50 per cent to the cost of tar-painting, but in future they were going to get 70 per cent.

Mr. FIDDIAN, answering Mr. Coleby's question as to the nature of the strata, stated that the whole of the bore was in the bunter series. He could not explain why the upper part of the pebble beds gave so much more water than the lower portion of the series, but they knew it as a fact. His paper referred to the difficulties experienced in getting through the beds of pebbles. There were large loose pebbles, and the trouble in dealing with these was considerable. It was simply a question of time, for they had really to grind them away. As to the conglomerate and other portions of the stone where there was no looseness, it was interesting to see how quickly the work was got through, the rate being about 9 ft. per day, except where pebbles were met with. He agreed with Mr. Thorp that it was most unusual to find farms of that extent let to a tenant, but their experi-

ence had been quite satisfactory: the farm had now been in existence for about twenty-eight years, and they would soon have paid up the loan on it. There had been no complaints from the council as to the quality of the effluent, or from anyone as to the management of the farm. The responsibility for the effluent was put upon the tenant, with whom they had a very binding agreement, which required him to distribute the effluent by his own staff, though, of course, he was subject to supervision by the board's officials. He thought the fact that they had gone on for so long without any difficulty spoke very well for the arrangement.

Mr. Webb expressed his thanks to the members for the way in which they had received his paper. As to the cost of the dehydrating plant, the particular variety they had was made in two sizes. Theirs was the smaller of the two sizes, with a capacity of 1,000 gallons per twelve hours. Working day and night they could turn out 70 tons per week. The cost of the plant as supplied by the makers was slightly over £200. Then there were foundations and tankage to consider; they must have plenty of storage both for the crude tar and the finished product. In their case the total cost was between £300 and £350. With regard to the difference in the cost of the crude and dehydrated tars, they had only had a few months' experience of the plant, and he could not quite say yet. But he should say, taking working expenses, interest and sinking fund and so on, a difference of from 12s. 6d. to 13s. would be a fair figure; that was to say, taking the value of crude tar at about 30s., it would mean about 43s. He agreed as to the economy of using steel drums in place of barrels, and tractors and trailers would be more economical still.

Following the business proceedings the members paid a visit to the engineering works of Messrs. Jones & Attwood, and afterwards were afforded an opportunity of examining the oil-gas plant and tar-dehydration plant installed at the gasworks. Lunch was served at the Talbot Hotel, and in the afternoon the party drove to the sewage farms belonging to the Stourbridge and Upper Stour Valley Boards.

ANNUAL GENERAL MEETING IN LONDON.

Following the customary Orphan Fund and council meetings, the thirty-ninth annual general meeting of the Institution of Municipal and County Engineers was opened yesterday (Thursday) morning at Caxton Hall, Westminster, and Mr. R. J. Thomas, M.Inst.C.E., county surveyor, Buckinghamshire, was formally installed as president, in succession to Mr. A. D. Greatorex, M.Inst.C.E., borough engineer of West Bromwich. The retiring president occupied the chair at the outset of the proceedings, the attendance at which is given herewith:—Sir James Lemon (Southampton), Sir Maurice Fitzmaurice (London County Council), Messrs. H. E. Anderson (Lambeth), J. Anstee (Guildford), J. Patten Barber (Islington), E. M. Bate (Frinton-on-Sea), J. P. Bennetts (Harrow), W. Nisbet Blair (St. Pancras), J. H. Blizard (Southampton), J. Birch (East Ham), H. Percy Boulnois (Westminster), W. L. Bradley (Tonbridge), A. T. Bridgewater (East Ham), J. S. Brodie (Blackpool), S. E. Burgess (Middlesbrough), W. Burn (Sutton-in-Ashfield), E. E. Butt (Birmingham), T. Caink (Worcester), A. H. Campbell (Edinburgh), J. E. Cardell (St. Ives). G. F. Carter (Croydon), W. B. Chancellor (Lichfield), S. H. Chambers (Hampton), H. T. Chapman (Somerset), H. A. Clarke (Briton Ferry), J. W. Cockrill (Great Yarmouth), T. Cole (secretary), H. J. Coleby (Atherstone), T. P. Collinge (Mansfield), F. C. Cook (Nuneaton), A. P. I. Cotterell (Westminster), J. S. Crawshaw (Weybridge), J. W. Croxford (Brentford), E. H. Crump (Hinckley), W. R. Davidge (Lewisham), C. F. Dawson (Barking), N. F. Dennis (West Hartlepool), J. R. Dixon (Woolwich), P. Dodd (Wandsworth), R. H. Dorman (Armagh), S. Douglas (Kenilworth), W. J. Dresden (Battersea), J. H. Drew (Wath-upon-Dearne), W. Dyack (Aberdeen), E. J. Elford (Southend-on-Sea), J. England (Wrexham), E. Evans (Carnarvon), W. Fairley (Westminster), W. Fiddian (Stourbridge), W. Fowlds (Keighley), A. Freeman (Rickmansworth), H. A. Garrett (Torquay), C. F. Gettings (Worcestershire), S. S. Gettings (Tring), H. A. Giles (assistant secretary), A. Gladwell (Eton), R. M. Gloyne (London County Council), H. E. Goldsmith (Eastwood), W. J. Goode (Bristol), F. T. Grant (Gravesend), A. D. Greatorex (West Bromwich), G. Green (Wolverhampton), W. H. Grieves (Sutton, Surrey), J. E. Hargreaves (Farnborough), J. L. Harpur (Brierley Hill), W. Harpur (Cardiff), F. Harris (Tunbridge Wells), G. A. Hart (Leeds), G. B. Hartfree (Alton), T. H. Hartley (Colne), J. Hassall (Sheffield), T. W. A. Hayward (Battersea), C. A. Hazeltine (Stepney), H. Heckford (Poplar), H. N. Hedges (Tring), A. F. Henderson (London), T. Henry (Retford), H. Holmes (Ossett), R. L. Honey (Chatham), E. P. Hooley (Nottingham), H. Howard (Littlehampton), W. T. Howse (Bexley Heath), T. Hunter (Leigh, Lancs), S. Hutton (Exmouth), R. H. Jeffes (New Malden), C. J. Jenkin (Finchley), C. Jones (Ealing), Christopher Jones (Hythe), W. Jones (Colwyn Bay), J. Julian (Cambridge), J. D. Kennedy (Retford), A. M. Ker (Warrington), P. G. Killick (Finsbury), J. S. King (Friern Barnet), F. O. Kirby (Doncaster), G. W. Lacey (Oswestry), W. T. Lancashire (Leeds), W. H. Leete (Bedfordshire), W. R. Locke (Hemel Hempstead), R. A. MacBrair (Lincoln), L. F. Mackenzie (Bristol), J. Marshall (Malling), E. B. Martin (Rotherham), F. Massie (Wakefield), E. R. Matthews (Bridlington), E. G. Mawbey (Leicester), G. Newcomen (Finchley), J. H. Norris (Godalming), J. Owen (Sutton, Surrey), E. Parry (Hitchin), R. S. W. Perkins (Isle of Ely), F. R. Phipps (Basingstoke), J. S. Pickering (Cheltenham), T. S. Picton (Eccles), W. Plant (Stafford), S. S. Platt (Rochdale), A. E. Prescott (Eastbourne), W. H. Prescott (Tottenham), A. J. Price (Eccles), A. J. Price (Lytham), W. H. Price (Leeds), W. B. Purser (Kesteven), W. Ransom (Worcester), J. L. Redfern (Gillingham), E. J. Reynolds (Friern Barnet), F. W. Richardson (Birmingham), L. Roseveare (South Shields), T. J. Rushbrooke (High Wycombe), T. Salkield (Delhi), R. Saunders (Gravesend), W. H. Savage (Cockfosters), N. Scorgie (Hackney), J. A. Settle (Bury), W. Shackleton (Nelson), J. S. Shaw (Wrexham), F. E. Sharpe (Cheshunt), H. Shillington (Lurgan), G. Eaton Shore (Crewe), J. Siddalls (Tiverton), E. J. Silcock (Westminster and Leeds), J. F. Smillie (Tynemouth), J. Gould Smith (Beverley), S. Stallard (Oxfordshire), W. J. Steele (Newcastle-upon-Tyne), A. Stevenson (Ayr), R. T. Stewart (Aylesbury), W. Stubbs (Blackburn), G. Sturgess (Chelsea), B. W. Stuttle (Stepney), J. Sutcliffe (Deptford), D. S. Sutherland (Southgate), M. H. Sykes (Stockton-on-Tees), J. Taylor (Walsall), W. H. Taylor (Aylesbury), R. J. Thomas (Buckinghamshire), W. O. Thorp (Malvern), S. Turner (Ashby-de-la-Zouch), F. C. Uren (Aldershot), E. Van Putten (Lewisham), C. Vawser (New Barnet), J. P. Wakeford (Wakefield), H. T. Wakeham (Middlesex), J. H. Walters (Congleton), J. D. Watson (Birmingham, Tame and Rea Drainage Board), W. Welburn (Middleton), A. E. White (Hull), H. A. White (Battersea), H. G. Whyatt (Grimsby), C. F. Wike (Sheffield), F. Wilkinson (Wimbledon), H. B. Williams (Workington), J. Williams (Hampstead), E. Willis (Chiswick), O. E. Winter (Hampstead), B. J. Wolfenden (Bootle), F. J. Wood (Lewes), F. Woodward (Stourbridge), E. Worrall (Stretford), W. Wright (Grantham), and G. E. Wrigley (Sowerby Bridge).

The minutes of the last annual meeting were read by the secretary, Mr. T. Cole, and confirmed, following which the annual report was submitted.

ANNUAL REPORT OF COUNCIL.

The council have pleasure in presenting the thirty-ninth annual report, recording the work of the year 1911-12.

NEW CONSTITUTION.

The last annual meeting saw the inauguration of the new constitution, carrying in its train changes of great importance.

Districts.—The various districts into which the institution is divided for administrative purposes have been altered to agree, practically, with those of the N.A.L.G.O. Certain districts remain unchanged, but the Northern, Yorkshire, Lancashire and Cheshire, Midland, Eastern, Home and Western districts have been recast to form new districts as shown:

Name of new district.	District chairman.	District representatives.	District secretary.
Scottish. (Vice president) J. Bryce.	J. Bryce.	J. Young.	D. Ronald.
Irish. (Vice president) H. A. Cutler.	W. Collen.	R. H. Dorman	M. Sellars.

Name of new district.	District chairman.	District representatives.	District secretary.
NORTH-EASTERN.			
Comprising Northumberland, Durham, Yorkshire.	F. Massie	E. B. Martin, E. R. Matthews.	J. P. Wakeford.
NORTH-WESTERN.			
Comprising Cumberland, Westmorland, Lancashire, Cheshire, Isle of Man.	J. A. Brodie.	J. S. Brodie, C. Brownridge.	A. W. Bradley.
EAST MIDLAND.			
Comprising Lincolnshire, Nottinghamshire, Derbyshire, Leicestershire, Rutland.	E. G. Mawbey.	E. P. Hooley.	R. A. MacBrair.
WEST MIDLAND.			
Comprising Staffordshire, Shropshire, Herefordshire, Worcestershire, Warwickshire.	A. T. Davis.	H. E. Stilgoe.	H. Richardson.
NORTH WALES.			
Comprising Anglesey, Flintshire, Denbighshire, Carnarvonshire, Merionethshire, Montgomeryshire.	W. Jones.	I. P. Evans.	J. England.
SOUTH WALES.			
Comprising Radnorshire, Cardiganshire, Pembrokeshire, Carmarthenshire, Brecknock, Glamorganshire, Monmouthshire.	W. Harpur.	G. A. Phillips.	H. A. Clarke.
SOUTH-WESTERN.			
Comprising Cornwall, Devonshire, Somersetshire, Dorsetshire.	H. T. Chapman.	T. Moulding.	T. Moulding.
SOUTHERN.			
Comprising Gloucestershire, Oxfordshire, Wiltshire, Berkshire, Hampshire, Isle of Wight, Channel Isles.	R. Read.	L. S. McKenzie.	F. R. Phipps.
SOUTH EASTERN.			
Comprising Surrey, Kent, Sussex.	A. Dryland.	J. L. Redfern.	F. Roberts.
EASTERN.			
Comprising Norfolk, Cambridgeshire, Huntingdonshire, Northamptonshire, Suffolk, Buckinghamshire, Bedfordshire, Hertfordshire, Essex, and that portion of Middlesex not comprised within the Metropolitan district.	A. Fidler.	W. H. Prescott, H. T. Wakelam.	E. J. Elford.
METROPOLITAN.			
Comprising the area within which the Metropolis Management Acts are in force.	J. Patten Barber.	N. Seorgie, O. E. Winter.	N. Scorgie.
INDIA.	Unfilled.	—	Unfilled.
AFRICA.	Unfilled.	—	Unfilled.
ABROAD.			
Comprising members resident in places other than those included in the above districts.	—	—	

The elections to the new district offices take effect as from the annual meeting at which this report is presented, and the council trust that the closer association with the general body of members, which it is hoped will be established by the direct election of district representatives serving on the council, will prove conducive to the best interests of the institution.

DISTRICT EXECUTIVE COMMITTEES.

The by-laws provide for the election of an "Executive Committee" for each district, and the council trust that these committees will be forthwith appointed.

DISTRICT MEETINGS.

During the year twelve district meetings have been held: At Handsworth, July 29th; Gidea Park, September 22nd; Paignton, September 30th; Battersea, October 21st; Westminster, February 9th; Exmouth, May 4th; Nuneaton, May 11th; Stirling, June 7th and 8th; East Ham, June 15th; Lowestoft, June 22nd; Bridlington, June 29th; and Stourbridge, July 6th.

VISIT TO PARIS.

A most interesting visit to Paris and its municipal works was paid at Whitsuntide, 1912, when about sixty of the members and their friends were most hospitably received by the authorities at the Hotel de Ville. The engineers of the various departments arranged a most instructive programme, and they spared no pains in explaining the several works and in giving every assistance in making the meeting an unqualified success.

HONORARY MEMBERS.

In view of the great interest taken in the work of the institution by the French engineers, the council have elected the following gentlemen as honorary members of the institution: Mons. G. Bechmann, Mons. M. F. Bienvenue, Mons. Colmet-Daage, Mons. de Pontich, and Mons. M. P. Tur.

SPECIAL MEETINGS.

Special meetings were held July 29, 1911, January 13, and February 9, 1912, in connection with the alterations to Memorandum and Articles desired by the institution, and also those insisted upon by the Board of Trade. The council trust to be able to report shortly that all statutory requirements have been complied with, and the Memorandum in its new form, removing the objectionable footnote to the testamur, and widely extending the scope of the work of the institution, is by the sanction of the court at last an accomplished fact.

THE ROLL OF THE INSTITUTION.

During the financial year ending April 30th last, 109 new members, consisting of 34 ordinary members, 46 associate members, and 29 students, have been elected. Twenty-eight resignations have been accepted and thirty names have been written off.

The names on the roll of (1) Associate Members, and (2) Associates and Graduates, on July 29, 1911, were respectively transferred (under the operation of Article 8) to the classes of (1) Members, and (2) Associate Members, and the roll now stands:—

—	1906 to 1907.	1907 to 1908.	1908 to 1909.	1909 to 1910.	1910 to 1911.	1911 to 1912.
Hon. members	9	9	8	8	8	13
Members	850	854	818	820	839	1,028
Associate members	—	39	78	114	128	243
Associates	141	123	127	137	131	—
Graduates ...	204	204	170	160	151	—
Students	—	—	—	—	—	29
Affiliated members	—	—	—	—	—	47
Total ..	1,206	1,509	1,301	1,239	1,257	1,360

The council record with regret the deaths of Mr. Lewis Angell (past-president), the founder of the institution, and of Mr. J. T. Eayrs (past-president), also of Messrs. G. J. Bell, W. Diggle, G. Heaton, E. I. Lord, and T. H. Tarbit.

The Council desire to urge upon the younger members of the profession the importance of becoming attached to the institution as students at as early an age as possible, and would ask the cordial cooperation of those members who have pupils or assistants upon their staffs not connected with the institution to induce them to join.

THE NEW COUNCIL.

Consequent upon the alteration in the constitution the number of ordinary members of council has been reduced from fifteen to ten, and district representatives have taken the place on the council hitherto held by the district secretaries.

The scrutineers, having examined the ballot lists, report the following members elected as the council for the year 1912-13:—

President: Mr. R. J. Thomas.

Vice-Presidents: Messrs. J. W. Cockrill, T. W. A. Hayward and J. S. Pickering.

Ordinary Members of Council: Messrs. J. Patten Barber, J. A. Brodie, J. S. Brodie, A. H. Campbell, G. F. Carter, A. E. Collins, W. Harpur, W. T. Lancashire, H. P. Maybury and C. F. Wike.

Hon. Secretary: Chas. Jones.

Hon. Treasurer: Sir James Lemon.

Serving upon the council, in addition to these, are the district vice-presidents and district representatives recorded earlier in this report.

THE FINANCES.

The accounts which accompany this report for the financial year ending April 30, 1912, have been duly audited by the official auditors, Messrs. Wood, Drew & Co., and are presented with this report. The fact that the year's working shows a slight deficit is accounted for by the heavy printing and lithography charges due to special expenditure on the Housing and Town Planning Conference volume, and to abnormal expenditure in connection with the reconstitution of the institution.

Having regard to the immense value of this con-

ference, and the gain in the prestige of the institution, as evinced by inquiries for the volume from all parts of the globe, the council are satisfied that the money has been wisely spent. During the year £600 has been invested in India 3½ per cent stock.

HOME EXAMINATIONS.

During the year three examinations have been held, for which eighty-six candidates entered (seventy-five presented themselves) for examination. Forty-three candidates satisfied the examiners, and have been granted the testamur of the institution. The council would again press upon members the desirability of requiring the possession of the testamur of the institution, or an equivalent qualification granted by a recognised examining body, as a condition precedent to making appointments to their staffs.

COLONIAL EXAMINATIONS.

An examination was held in Cape Town in April last, at which one candidate satisfied the examiners, and has been granted the testamur of the institution.

The long distances to be travelled by candidates, both in Africa and India, present considerable difficulty in making arrangements, but the council trust that these will be overcome, and that this branch of the work of the institution will be extended in the near future. Arrangements for the holding of an examination at Hong Kong are at present under consideration.

PREMIUMS.

The council have awarded the following premiums for papers published in the last volume of "Proceedings":—

£5 5s. to A. J. Price (graduate), for his paper, "Pumping Plant for Sewerage and Water Works."

£4 4s. to W. Ransom, for his paper, "Filtration and Purification of Water for Public Supply."

£3 3s. to F. G. Holmes, for his paper, "The Main Drainage and other Municipal Works at Govan."

£3 3s. to C. G. Mason, for his paper, "Municipal Progress in Guildford."

For papers read at the Housing and Town Planning Conference the council awarded institution premiums as follows:—

£3 3s., T. Wallis Gordon, for "Town Planning as Applied to Suburban Areas."

£2 2s., W. Wainwright, for "The Municipal Engineer and Town Planning."

£2 2s., E. A. Slater, for "The Planning of an Industrial Suburb."

PRESIDENT'S PRIZE.

The prize offered by Mr. A. D. Greatorex (president) for the best paper read by a student at the annual meeting has been awarded to Mr. W. H. Price for his paper on "Town Planning," to be read at this forthcoming annual general meeting.

AFFILIATION OF THE SCOTTISH ROAD SURVEYORS' ASSOCIATION.

The council record with pleasure the completion of the affiliation of this association with the institution, resulting in an accession of fifty-three affiliated members. Six of these gentlemen have been elected at their request to full membership.

ADMISSION OF VISITORS.

The council have revised the regulations for the admission of visitors to the meetings of the institution, and the new arrangements appear to be giving general satisfaction.

NEW OFFICES.

Continuous efforts have been made during the past year to find more adequate and suitable premises for the increasing work of the institution, and for the holding of the numerous council, committee and other meetings, but up till now without success. The new council will therefore take up this task as one of the urgent matters requiring their attention.

ARBITRATION CLAUSE.

The council received a request from the National Federation of Building Trades Employers, and referred the consideration of a clause relating to arbitration in engineering contracts to a committee. After very full discussion, the council, on the recommendation of the committee, have informed the federation that they are prepared to recommend that the members of the institution adopt the form of clause set out hereunder in lieu of the usual clause appointing the engineer to the arbitrator in case of dispute with a contractor.

ARBITRATION.

In case any dispute or difference shall arise between the council, or the engineer on their behalf, and the contractor, either during the progress of the works or after the determination, abandonment, or breach of the contract, as to the construction of the contract, or as to any matter or thing arising thereunder (except as to the matters referred to in the undermentioned clauses "*a* to . . . "), all which shall be left to the sole discretion or decision of the engineer—*viz.*:—

*(*a*) As to the provision of everything necessary for the proper execution of the works, &c.

*(*b*) As to the amendment of errors arising from inaccurate setting out of works.

*(*c*) As to the quality of materials and workmanship.

*(*d*) As to the competency of the general foreman on the works.

*(*e*) As to the competency or conduct of any person employed on the works by the contractor.

*(*f*) As to the measurement and valuation of extra work and variations, or the mode of ascertaining the amount to be allowed for extra work and variations.

*(*g*) As to the rejection and removal of work and materials not in accordance with the specification or the instructions of the engineer, and the substitution of other work and materials therefor, and all other matters referred to in this clause.

*(*h*) As to defects or faults which may appear in the works after completion.

*(*i*) As to the opening of work for inspection.

*(*j*) As to the date when the works are completed.

*(*k*) As to the execution of works having been delayed by inclement weather and other causes.

*(*l*) As to the carrying on of the works with due diligence, &c.

*(*m*) As to the expenditure of provisional sums.

*(*n*) As to the issuing of certificates relating to payments to the contractor.

Also, except as to the matters referred to in the under-mentioned clauses numbered "A to . . . ," all of which shall be left to the sole discretion or decision of the council:—

*(A) As to the assignment or sub-letting of any portion of the works.

*(B) As to the determination of the contract by the council, or as to the withholding by the engineer of any certificate to which the contractor may claim to be entitled, either party shall forthwith give to the other written notice of such dispute or difference, and such dispute or difference shall be and is hereby referred to the arbitration and final decision of a person to be appointed, on the request of either party, by the president for the time being of the Institution of Municipal and County Engineers, and the award of such arbitration shall be final and binding upon the parties. Such reference, except of the question of certificate, shall not be opened until after the completion, or alleged completion, of the works, unless with the written consent of the council, or the engineer, and the contractor. The arbitrator shall have power to open up, review, and revise any certificate, opinion, decision, requisition, or notice, save in regard to the said matters expressly excepted above, and to determine all matters in dispute which shall be submitted to him, and of which notice shall have been given as aforesaid, in the same manner as if no such certificate, opinion, decision, requisition, or notice had been given. Upon every or any such reference, the cost of and incidental to the reference and award respectively shall be in the discretion of the arbitrator, who may determine the amount thereof, or direct the same to be taxed as between solicitor and client, or as between party and party, and shall direct by whom and to whom and in what manner the same shall be borne and paid. This submission shall be deemed to be a submission to arbitration within the meaning of the Arbitration Act, 1899:—

Provided always that this clause shall not apply to any contract, the total original amount, sum, or value of which, exclusive of any extras or additions, is less than one thousand pounds (£1,000), or to any differences or disputes which in connection with any one contract shall involve a total amount, sum, or value of less than fifty pounds (£50), in either of which two events all matters arising out of the contract and any differences or disputes shall be in the sole judgment and discretion of the engineer, whose decision shall be final and binding on all parties and without appeal.

PRICED SCHEDULES WITH TENDERS.

The same federation drew the attention of the council to the practice of many engineers to local authorities

* These are intended as illustrations of the matters which engineers may wish to deal with, them-selves, or may wish their councils to deal with, instead of allowing them to be submitted to arbitration. Each engineer can insert in this part of the clause whatever matters he desires to exclude from arbitration.

requiring that priced bills of quantities and schedules should accompany tenders. The council passed the following resolution, and recommend the same for adoption by the members: "That it is not necessary, nor is it desirable, that priced bills of quantities and schedules should be sent in openly with the tenders; but that it is essential that the prices in the bill of quantities and schedule should be approved by the engineer before a tender is recommended for acceptance."

HOUSING AND TOWN PLANNING CONFERENCE.

The council record with gratification the great success of the conference held at West Bromwich in connection with the last annual meeting, when nearly 200 delegates were appointed by their respective authorities to attend. Seventeen papers dealing with the subject in all its aspects were read and discussed, and were subsequently printed, together with the discussions, in a volume published by Messrs. Spon & Co., 57 Haymarket, price 10s. 6d. Copies may still be obtained, but the edition is being rapidly exhausted. The papers were profusely illustrated and numerous reproductions of the plans kindly lent by various authorities and others, and exhibited during the conference, were also included in the volume. Unfortunately the engagements of the Right Hon. John Burns, President of the Local Government Board, prevented his attendance, but in a letter subsequently written to the secretary he conveyed his hearty congratulations to the institution upon the valuable addition afforded by the volume to the literature upon this important subject. The council have received an invitation from the Royal Institute of British Architects to appoint delegates to a conference to be held in the near future to consider the necessity for the co-ordination of town planning schemes. The council have delegated Messrs. John A. Brodie, J. W. Cockrill, and H. E. Stilgoe to represent the institution at this conference.

HONOURS TO MEMBERS.

The council record with gratification that the honour of knighthood has been bestowed on one of the members of the institution, Sir Maurice Fitzmaurice, C.M.G., and that a past-president, Mr. John A. Brodie, has been chosen to advise the authorities in the town planning of Delhi, the new capital of India.

ENGINEERING APPOINTMENTS BOARD.

The council desire to draw the attention of the members to the Appointments Board recently formed by the Institution of Civil Engineers. This board, for a nominal fee, will endeavour to bring those requiring engineering assistants and those qualified to fill the position into contact. At the same time the council would remind members that the services of the official staff of this institution are always at their disposal in this direction.

MUTUAL DEFENCE FUND AND THE CASE OF MR. W. JONES (COLWYN BAY) *v.* FROST.

The council referred this particularly hard case, in which the plaintiff was compelled to bring an action to vindicate his character, to their solicitor, Mr. A. M. Bramall. Mr. Jones achieved complete success, being awarded heavy damages and his costs, but, unfortunately, the defendant proved to be utterly without means, and Mr. Jones has been unable to recover either damages or costs, the latter amounting to some £240. Mr. Bramall advised the council that, although legal assistance might have been provided out of the funds, had application been made to the council for such assistance, the memorandum clearly prohibited the payment of any sum of money to recoup Mr. Jones. Hitherto the power to assist members, by the provision of legal advice, contained in the memorandum, has been relied upon, but with the increased scope of the memorandum as it now stands the council feel that a defence fund has become an urgent necessity. On the motion of Mr. A. D. Greatorex (president), the council recently referred the matter to the chairmen of their Standing Committees, and it is to be hoped that a scheme will shortly be placed before the members for their approval and adoption. In the meantime the council have started the Mutual Defence Fund with donations amounting to some £30, and a circular letter, appealing for immediate support, accompanies this report. Direct financial assistance from the funds of the institution being prohibited by the Memorandum of Association as aforesaid, the council have already assisted out of the defence fund, and trust that a cordial response from the members will enable them further to assist the hard case above referred to, and to place the fund on a working basis.

STANDARDISATION COMMITTEE.

This committee has held numerous meetings during the past year, and has had under consideration a number of matters relating to standardisation, the more important being the following:—

Concrete Flags.—The standard specification has been completed and published at 2s. 6d. per copy. It has met with a ready sale, and the first edition is being rapidly disposed of.

Vitrified Pipes.—See delegates' reports.

Period of Loans for Wood Paving.—This question has also been under the consideration of the committee, and they have now received an intimation from the Local Government Board that, as a general rule, the period for repayment of loans for creosoted soft woods will be the same as for hard woods—*viz.*, ten years, the period for uncreosoted soft woods being five years.

ROADS COMMITTEE.

The council's attention having been called by the Cyclists' Touring Club to the damage caused to road surfaces by studded tyres, a reply was sent that the council had already endeavoured to obtain an amendment to the law relating to this subject, and will continue to press the importance of the matter upon the Local Government Board. The council have given careful attention to the urgent necessity of amendments to the Highways and Locomotives Act, 1878, and the Heavy Motor Car Order, 1904, and have made strong representations to the Local Government Board accordingly. The council have also considered suggestions as to caution symbols, and have forwarded their recommendations to the County Councils Association. A resolution passed by the Lower Thames Valley District Surveyors' Association, as to further powers being conferred upon local authorities to define the routes of heavy motor traffic, was received. After careful consideration the council found themselves unable to agree with the suggestion that local authorities should have conferred upon them the power to define routes for such traffic.

DELEGATES.

The following gentlemen have been appointed to serve the institution as delegates to other bodies:—

Mr. Charles Jones, hon. secretary to the Sanitary Inspectors' Examination Board.

Messrs. A. D. Greatorex and N. Scorgie to the N.A.L.G.O.

Mr. E. B. B. Newton to the Plumbers' Registration Committee.

Messrs. W. Harpur and C. F. Wike to the Engineering Standards Committee (Tramway Rails).

Messrs. J. Patten Barber, E. J. Elford, and F. W. Pearce to the Engineering Standards Committee (Vitrified Ware Pipes).

Messrs. E. J. Elford and R. J. Thomas to Engineering Standards Committee (Conference on Road Materials).

Messrs. A. D. Greatorex and J. Walker Smith to the Royal Sanitary Institute Congress.

Mr. E. Purnell Hooley to the Central Committee on Road Statistics.

Messrs. E. Purnell Hooley, H. P. Maybury, and R. J. Thomas to Central Committee on Road Statistics (Conference on Highways and Bridges Act).

Messrs. G. F. Carter, E. J. Elford, T. W. A. Hayward, E. B. B. Newton, and N. Scorgie to the Institution of Electrical Engineers (Joint Conference on Street Lighting).

Messrs. A. D. Greatorex, E. P. Hooley, A. T. Davis, H. P. Maybury, and R. J. Thomas to the General Committee, International Roads Congress, 1913.

Messrs. E. J. Elford, A. D. Greatorex to Engineering Standards Committee (Cast-iron Pipes).

REPORTS FROM DELEGATES.

Mr. N. Scorgie: *National Association of Local Government Officers.*—During the past year meetings of the National Council have been held in London and at Leamington, and the membership roll since the last report has increased by nearly 7,000.

The activities have been great during the past twelve months, one of the most notable accomplishments being the inauguration of an extensive scheme of examination for the clerks of the various departments of a local authority. This scheme has met with universal approval by the progressive young men engaged in local government administration, and will meet a long-felt want by those officers who have never before had an opportunity of securing a diploma of efficiency in their particular kind of work. There is not any intention by the N.A.L.G.O. of competing with

existing examinations conducted by professional associations, and every precaution has been taken to avoid overlapping.

In the surveyors' section the professional side is not touched, but an examination for clerks in engineer and surveyors' departments is held. The syllabus for this department is wide, and any clerk desirous of passing the examination will have to be well versed in the general routine and organisation of a surveyor's department, and be possessed of a good knowledge of the law relating to our work. Anything which tends to improve the efficiency of the municipal clerk should be grasped by both hands. The launching of the N.A.L.G.O. examination scheme will be a decided help to the engineers and surveyors of the service, since it helps to make more proficient their clerical staffs.

The Benevolent and Orphans' Fund, which only came into real existence about twelve months ago, is making rapid strides. During the past year several cases of distress have been taken in hand. It is confidently anticipated that by the end of the association's current year—September next—several hundreds of pounds will have been accumulated. With such an extensive membership as the N.A.L.G.O., and given proper support, it should be possible for this fund to meet all cases of distress that may occur in the local government service. The ideal being aimed at by the National Association is a high one, and it is quite within the bounds of possibility that its scope of usefulness will overtake that of the N.U.T. and other great institutions.

The superannuation question is the one no doubt nearest to our hearts, and no one can say that the N.A.L.G.O. is lacking in efforts to bring about legislation embodying a system of deferred pay for municipal officers. It is, however, a problem pregnant with difficulties, one of the greatest of which is to educate our employers—the authorities—to realise that the officers will not benefit alone by a proper scheme of national superannuation. The primary object and ultimate effect of a national superannuation scheme is efficiency. It is no rash statement to say that a contented municipal officer is a valuable asset, and to be relieved of the worry of making provision for the evening of our careers would allow most of us to give our best to the service with a feeling of contentment. The policy of the National Association is not to rush hazardously to Parliament and demand superannuation, but to petition the Government and the local authorities, through their organisations, with a view to an all-round appeal being made for treating the local government officer like other public servants as regards superannuation. In this direction rapid strides have been made. The N.A.L.G.O. has been successful in enlisting the sympathy of the County Councils' Association, the Urban District Councils' Association, and is now in negotiation with the Association of Municipal Corporations, which important body it is hoped will make a favourable report in the near future. It is much better to meet any opposition before going to St. Stephen's than after entering the House of Commons, and the N.A.L.G.O. is to be complimented upon, and encouraged in, furthering the safe policy which it has adopted on this important matter.

Security of tenure of office is another subject which interests the municipal engineer, and it will no doubt be a source of satisfaction that the N.A.L.G.O. superannuation includes a clause to ensure the security of tenure of the office of the local government officer.

The interests of the local government officer have been closely watched with regard to the National Insurance Act. A special committee has been sitting for many months past, and has made periodical reports to the federated branches, repeatedly making suggestions as to the line of action which they should take up. An approved society has been formed through which the officers will get better benefits than any other society can offer in return for the minimum total contributions of employer and employee of 7d. per week. This step is one of paramount importance to local government officers, and will, no doubt, be supported by thousands.

The N.A.L.G.O. has applied for a Royal Charter of Incorporation, and is now awaiting the decision of the Privy Council.

The foregoing report deals chiefly with what might be termed the "large" objects of the association; but the work and influence of the N.A.L.G.O. is by no means confined to those matters. The question of altering the Treasury's ruling on compensation on abolition of office has received careful attention during the past year, and the efforts of the N.A.L.G.O. will no doubt bring about some improvement. Assistance has been given to the Irish officials in their efforts to include safeguards in the Home Rule Bill. The association has also been of great assistance to a large number of officers in tendering legal advice on matters affecting their status, and this year a large proportion of the association's income has been earmarked for law and Parliamentary purposes.

Mr. W. Harpur: Your representatives on the Engineering Standards Sub-Committee on Tramway Rails have to report that little work has been done in connection with standardisation during the past year, their work having practically ceased when the standards were agreed to by the main committee.

There have, however, during the year been several additions made to the committee, and, in consequence, there have been proposals for certain alterations in the standard sections of rails. Nothing, however, has been definitely decided upon these matters, which are still under consideration.

Recently further additions to the Tramway Rails Sub-Committee have been made by the appointment of two additional representatives, each from the Light Railways and Tramways Association and the Municipal Tramways Association.

As a consequence your Tramways Committee have asked for similar increased representations on the sub-committee, and the matter is to come before the main committee at an early date.

Mr. E. J. Elford: *Vitrified Ware Sewer and Drain Pipes.*—The draft specification prepared by your Standards Committee has been referred to the Engineering Standards Committee, and is now being dealt with by a sectional committee, comprising engineers, architects, manufacturers, and representatives of Government departments. The various clauses of the draft have been discussed at considerable length, and a number of points have been agreed. The representatives of this institution have reported from time to time to the Standardisation Committee, and various modifications have been agreed to.

Cast-Iron Pipes.—The committee have drafted a specification, which has been printed and circulated.

Mr. R. J. Thomas: Your delegates attended a conference called by the Engineering Standards Committee to consider whether the standardisation of road material is desirable.

It was resolved that such standardisation was desirable, and that the Main Engineering Standards Committee be recommended to form a sectional committee to deal with the matter.

Mr. T. W. A. Hayward: The council last year were invited to send five representatives to a conference to take into consideration the preparation and issue of a standard specification for street lighting. The council, on the recommendation of the Standardisation Committee, appointed the following as their representatives: Messrs. G. F. Carter, E. J. Elford, T. W. A. Hayward, E. B. B. Newton and N. Scorgie.

Thirteen meetings have been held, the attendances of your representatives being as follows: Mr. E. J. Elford, 12; Mr. T. W. A. Hayward, 12; Mr. E. B. B. Newton, 11; Mr. G. F. Carter, 9; Mr. N. Scorgie, 8. The draft specification has been prepared, and will, in the near future, receive the consideration of the council of the institution. It is hoped that the specification may be issued at no distant date.

Mr. E. Purnell Hooley: The question of systematically dealing with direction-posts and danger-signals has again been the chief question before the committee, as the committee's previous recommendations were again amended by the County Councils Association. A difficulty in getting sufficient members to attend on any one day has been experienced, and the committee has been asked to accept the name of a second representative of this institution.

Mr. R. J. Thomas *International Roads Congress.*—Messrs. A. D. Greatorex, E. P. Hooley, H. P. Maybury and R. J. Thomas, representing the institution upon the General Committee of the International Roads Congress, 1913, attended the meeting of the General Committee, when sub-committees were elected to deal with each question set forth in the official programme. It is satisfactory to note that the institution is represented by a large number of members upon these sub-committees. Several meetings have been held, the course generally adopted being to invite observations and opinions on each question from those conversant with and experienced in the branch of road work referred to. Each Committee will consider the views set forth in these communications, and prepare for the congress a report indicating

the generally accepted practice in this kingdom relative to the question under review.

CONCLUSION.

In conclusion, your council feel, in a review of the proceedings, which have occupied the attention of the various committees and the council at large, that they have much reason to congratulate the members upon the satisfactory results of the year. There has been no more critical year in the history of the institution. Subjects upon which much difference of opinion existed have been satisfactorily arranged, and new departures have been inaugurated which, your council feel assured, will tend still further to strengthen the bonds of union which in the past have tended so materially to the best interests of the institution in which we are all so deeply interested.

The RETIRING PRESIDENT (Mr. A. D. GREATOREX) formally moved that the annual report be received and approved.

Mr. W. H. PRESCOTT (Tottenham) seconded, and remarked that he had a very decided sympathy with the general scope and objects of the recommendation in the report. A scheme of mutual defence was long overdue, and he was glad indeed that an energetic and determined step was at last being taken as a counter-stroke to the scandalous attacks made upon municipal engineers in the honourable discharge of their public duties. He thought it ought to be made clear in this connection that the question of superannuation and security of tenure would not be relegated to a secondary place.

Mr. T. HENRY (Retford) said he was glad to hear from the last speaker that superannuation and security of tenure were not to be thrown into the background by the establishment of the Defence Fund. When an important official like the ex-town clerk of Nottingham wrote, as he recently did, that official life had been made intolerable, he (the speaker) thought it behoved every one of them to use all their efforts in furtherance of superannuation and security of tenure.

Mr. C. VAWSER (New Barnet) commented approvingly upon the increased membership of the institution, but called attention to the fact that there were still 1,441 public authorities unrepresented in the institution. He trusted, now that a new council was coming into existence, they would seek to do everything possible to increase the roll of members, and thus add to the value of the institution's work. In their report the council again pressed upon members the desirability of acquiring the testamur of the institution, or some equivalent qualification granted by a representative body. It was to be regretted that the council did not carry that recommendation out by communicating with public authorities when vacancies arose requesting the recognition of these qualifications. The speaker urged that further energy should be exercised by the council in the effort to obtain new official premises, and proceeded to contend that they would be quite justified in using the institution moneys as a Defence Fund. Alluding to the report of Mr. Scorgie, the speaker said he was pleased to hear that the National Association of Local Government Officers was not lacking in efforts to bring about legislation embodying a system of deferred pay, but it did not

A. G. GREATOREX (*President*).
JAMES LEMON (*Hon. Treasurer*). THOMAS COLE (*Secretary*).

Report to the Members of the Institution of Municipal and County Engineers.

In accordance with the provisions of section 113 of the Companies (Consolidation) Act, 1908, we report that we have examined the above Income and Expenditure Account and Balance Sheet with the books and vouchers and have obtained all the information and explanations we have required. The Balance Sheet, in our opinion, is properly drawn up so as to exhibit a true and correct view of the state of the Institution's affairs according to the best of our information and the explanations given to us, and as shown by the books.

WOOD, DREW & CO. (Chartered Accountants), Auditors to the Institution.
6 & 7 Queen Street, Cheapside, London.
June 22, 1912.

appear that any progress had been made. As to security of tenure, he admitted that that was a question surrounded by very great difficulties.

Mr. W. H. Grieves (Sutton, Surrey) complained that the Association of Kent Surveyors should have taken upon itself, with respect to the election of a district representative, a duty that ought to have devolved jointly upon the Kent, Surrey, and Sussex local bodies, which comprised the South-Eastern district. In this connection he also objected to the letter sent out by Mr. Maybury.

Mr. A. Ernest Prescott (Eastbourne), as one who was responsible for the correspondence that appeared in the Press with respect to the subject referred to by the last speaker, did not mind saying that he should do the same thing again, because he did not think the members of the South-Eastern district had been treated fairly. There was a meeting convened—(cries of "No!")—well, there ought to have been. He was sorry Mr. Maybury was not present, as the explanation asked for with respect to the matter had not been forthcoming.

Mr. E. Willis (Chiswick) said he rose to bless rather than to curse, because he thought the council were very much to be congratulated on their report. Mistakes might have been made with regard to the district committees, but he thought it was hard that the council should be blamed for them. He urged the desirability of fostering still further the interests of the pupils and younger members, because he saw that a large number of junior members were joining another institution—an institution which might have very laudable objects, but which was not so representative as this one. He was of opinion that progress was being made in the matter of superannuation, and that it would be obtained before five or six years had passed by. Security of tenure, he admitted, was a very difficult problem. He supported the Mutual Defence Fund, and he was particularly delighted to find that the Orphan Fund was pushing ahead. He appealed to the members for further support of this fund, even if they only gave a shilling a year.

Mr. G. W. Lacey (Oswestry) thought that there had been initial difficulties with respect to the district committees which would not exist in the future, when the necessary officials had been appointed. He noticed that the account for printing was £792, an increase of nearly £100, which did not appear to be accounted for by the increase of membership or the cost of printing.

Mr. W. T. Wakelam (Middlesex) thought that Mr. Willis had struck the keynote of the discussion when he said "Support the council." Continuing, the speaker said that when he started the question of the Defence Fund he was not aware that the council had taken the matter up. When he ascertained this, he at once handed over the correspondence and contributions he had received to the council.

Mr. W. Harpur (Cardiff) thought he was right in saying that as a matter of fact the district committees did not come into actual operation until that day (Thursday), and the meetings previously held were therefore quite informal. He endorsed the appeal of Mr. Willis for subscriptions to the Orphan Fund, and gave a cordial support to the Defence Fund movement, remarking that it was an object to which they could not devote too much attention.

Mr. T. S. Picton (Eccles) called attention to the amount of the arrears of members' subscriptions (£220), and earnestly appealed for the clearance from the books of this particular item.

The Retiring President (Mr. A. D. Greatorex) then replied to the discussion, and explained that the printing bill had been unavoidably increased owing to the negotiations with respect to the alteration of title and changing of the constitution. He ought, he said, to have stated, in moving the adoption of the report, that the final stage had been reached and the title granted. He endorsed the statement of Mr. Harpur that the district committees did not come into operation until the meeting that day, and that the previous meetings were informal ones. He personally wrote to certain members of the council and asked them to call those informal meetings, and it was therefore evident that some little misunderstanding must have taken place. There could have been no shadow of complaint if his instructions had been carried out. With respect to the subscriptions in arrear, the Finance Committee had made every possible effort to reduce the amount. It was to be regretted that the members of the institution could not see their way to pay their subscriptions when due, and he trusted the hint would be duly taken. Another matter to which the attention of the council had been called was the subject of a very nastily written letter which appeared in one of the professional newspapers dealing with the integrity of municipal surveyors. The council felt they could not allow the matter to be overlooked, or allow the meeting to pass without reference to it, and he proposed to move that the members of the institution strongly resented the imputations contained in the letter in question, which gravely reflected upon the integrity of municipal surveyors and surveyors generally.

Mr. W. H. Prescott (Tottenham) seconded, and said it should be made clear that the writer was a man holding a responsible position who supplied stone-breaking machinery to various municipalities. Their difficulty in the matter was that the writer had been careful not to make a specific charge against an individual. The writer made charges of bribery, and it was to be recalled that lately several well-known municipal engineers had found it necessary to bring actions to clear themselves from libellous imputations. In every case the charges were proved to be utterly false. Personally he was in favour of proceeding by way of criminal information in cases in which there was a doubt about the financial stability of the defendant. (Hear, hear.)

Mr. W. Nisbet Blair (St. Pancras) pointed out that the offensive passages in the letter were expunged by other professional journals, who had treated them honourably and fairly.

The report and balance-sheet was then adopted, and the resolution put from the chair was carried unanimously.

PRESENTATION OF PREMIUMS.

Premiums for papers read during the year were presented to the writers, whose names are set out in the annual report.

The new president, Mr. R. J. Thomas, M.Inst.C.E., having been invested with the chain and badge of office of the retiring president, proceeded to read his address, as follows:—

PRESIDENTIAL ADDRESS.

The recent confirmation by the Court of the Amended Memorandum of Association has brought to a conclusion the labours of your council, and particularly of the Constitution Committee, which, presided over by its indefatigable chairman, Mr. J. Patten Barber, considered in minutest detail various suggestions and proposals having as their objective the improvement of the professional status of members, and of the institution's position among kindred societies.

In such an organisation as ours there must necessarily be varied opinions and convictions relative to the best methods for hastening its development in practical utility and power; were it not so the incentive to progress and activity would be absent. Recent events have shown many divergent views in matters of detail affecting our welfare, but, inspired by the predominant desire to promote the best interests of the institution, mutual concessions have been made, and I have every faith that the amendments agreed to will be accorded hearty and loyal support by our members.

It is to be regretted that some of the recommendations made by the council, and adopted by the members, failed to secure the approval of the Government department having the power of veto, and had therefore to be amended in accord with its requirements; but it is confidently believed that the memorandum as now sanctioned will materially assist the institution in its efforts to advance the interests of its members individually and collectively. That this belief should prove well founded is my earnest desire, particularly in the interests of our younger members, to whom belongs the future of the institution.

DISTRICT REPRESENTATION.

We are entering upon the new system of district representation adopted by the members, and I fully believe that such alterations cannot fail to yield beneficial results, by stimulating local effort, encouraging intercourse between members located in each district where, presumably, many of the conditions and difficulties are common to all, and, by frequent meetings, bringing members into closer touch and within reach of that personal support and intercourse which so materially assists and encourages an engineer, who has perforce to carry out his arduous duties in professional isolation during the greater part of the year.

It will no doubt require time to secure perfect working of the new arrangement, but, with energetic district officers and committees, and whole-hearted support from their constituents, its benefits and advantages must, at an early date, produce substantial results, enhance the value of the institution to its members, and improve its position in the local government of the kingdom.

It is desirable that meetings be arranged in each district at the earliest possible date, to elect committees and determine the working arrangements. The discussion to be raised during this meeting should materially assist district officers in these preliminaries.

THE INSTITUTION EXAMINATIONS.

It is most encouraging to find that the number of candidates presenting themselves for examinations held by the institution is well maintained, although the educational qualifications required before applications to sit can be granted are now in accord with the requirements of modern professional life; as a consequence, there is an obvious improvement in the general quality and form of the answers given in the examinations, affording abundant promise of future distinction to the candidates and dignity to this institution.

To one who found the testamur of the utmost value at a critical period in his early career, nothing in the work of the institution appeals with greater force than these examinations, and I trust that members will continue to afford every opportunity to their assistants to prepare for and take part in them.

It is desirable to inform parents of prospective pupils that certain scholastic credentials are necessary prior to obtaining permission to sit for the examination, and that it is generally easier for a youth to obtain these before leaving school or immediately after than later.

SUPERANNUATION AND STATE PROTECTION OF OFFICIALS.

Superannuation is still unattained, although the National Association of Local Government Officers continues its efforts, supported by subscriptions and delegates from this institution; but, although recent rumours of early attainment may be too optimistic, it is difficult to comprehend how some public officials can longer be excluded from benefits granted to others having no more arduous or responsible duties to perform. It is much to be hoped that Imperial Parliament may make time to consider the long-overdue claims of local government, of which adequate superannuation of all officials who have given of their best to the common weal should form an early instalment.

No less important is the provision of State protection for officials whose duties inevitably bring them at times into conflict with those who endeavour to evade the requirements of public authorities, and who, having influence with members, and even themselves sitting upon such bodies, are prone to make a conscientious official's life a burden to him, and often succeed in securing his dismissal, unless he is prepared to abandon his principles and betray the trust placed in him by his employers.

It is too true that there are many instances of this in smaller towns and districts, where the emoluments are so small that the official is sorely tried in his efforts to provide honourably for those dependent upon him. That such cases should exist is an anomaly, as Departments of State which sanction loans, by-laws and regulations should afford protection to those officials responsible for their observance, and who, upon adequate investigation, are found to have carried these duties out faithfully and impartially.

Having had experience of the difficulties attached to communications and interviews with authorities whose treatment of their surveyors was, in the opinion of your council, such as to warrant protest, I am strongly of opinion that in a very large majority of cases this interposition of an institution having practically no executive power can secure but little relief to the officer, however cautiously and tactfully this interference between employer and employed is effected.

It is essential that either this institution should have far larger powers in this direction, or that the State should afford our profession the measure of protection accorded to others.

The opinion of our solicitor that the new memorandum of Association as amended by the Board of Trade precludes the use of the institution's funds to defray the costs incurred by a member in a recent libel action is most disappointing, and members are justified in feeling their regret that this desirable power has been denied them.

The alternative appears to be an independent fund raised by annual subscriptions, and, as steps have been taken to formulate a scheme, I feel confident that for such a desirable object members will gladly subscribe, so that a substantial fund can be established upon which a representative committee can draw in support of all cases which, after due investigation, are found worthy of financial support.

ROADS.

The past year has witnessed the active participation of the Road Board in the work upon our roads, and we can but regret that they are precluded from making any contribution towards the rapidly increasing maintenance charge. This presses especially hardly upon rural districts of small rateable value and encumbered with a large mileage of roads, many used in ever-increasing proportion by through traffic, heavy and rapid. The board's contributions towards the extra cost of employing materials and methods more suited to modern traffic must gradually retard that rapid growth in expenditure experienced during recent years, when roads adequate and suitable for the traffic of ten to twelve years ago have been found unequal to the task of sustaining the phenomenal growth of self-propelled traffic, and the annual cost for maintenance of which has risen a million during that period.

The assistance afforded to local authorities in widening exceptionally narrow roads, and in opening out dangerous corners must be of general advantage to the travelling public, especially as the policy adopted of providing an unobstructed view across dangerous corners and at intersecting roads, rather than rounding off such places, adds to the security of general traffic without facilitating more rapid negotiation of such corners.

That there are many difficulties to overcome and interests to be considered before the roads in this country can be straightened, widened and improved, so as to compare with those in countries of recent development, is exemplified by the divergent views expressed relative to the board's offer of a contribution towards the provision of a new and adequate approach road to London from the west.

Although the board's scope and powers are at present somewhat restricted, I believe the future will see important and far-reaching developments, when the fact becomes more and more evident that the traffic upon our roads is no longer local and intermittent, but national and constant, unrestricted by distance, time, or season, thus making it essential that national funds be allocated to the uniform maintenance of important highways, whether traversing thinly-populated and poor districts, where an expenditure of, say, £100 per mile means a 1s. rate, or those in crowded and wealthy areas, where a similar expenditure represents but a 1d. rate.

It is a matter of satisfaction and congratulation that the Engineering Consultative Committee of the board is composed of prominent members of this institution, whose technical knowledge and experience are of the highest and command the confidence of our profession.

The Third International Road Congress takes place in London next year, when I trust the members of the institution will be largely represented and assist in making the congress the most successful and beneficial yet held. The past few years have witnessed an exceptional advance in the practice of road construction and maintenance in this country, including the provision of mechanical appliances of the greatest utility, and unquestionably there is a mass of valuable information available if our members take their part in providing the congress committees now at work with the results of their investigations and practice.

I trust therefore that members who have not yet contributed the results of their experience will, at an early date, communicate with the honorary secretary of the congress or any members of the institution acting upon its various committees, by whom such information will be duly considered and incorporated in the reports to be submitted to the congress, as representing the opinion of road engineers of this country.

The inconsistencies and anomalies in the Highways Acts, the Motor Car Act, and the Heavy Motor Car Order, relative to weights permitted upon roads, licences payable, &c., are daily becoming more apparent, and further efforts should be made to secure their amendment and simplification, not only in the

interests of road authorities, but also of owners of some classes of self-propelled vehicles, now seriously handicapped in the keen struggle for existence.

Progress has been made in this direction by the institution in calling the attention of the Local Government Board and the County Councils Association to these urgently required amendments, and I am strongly of opinion that the institution should continue its efforts to secure early adjustment of these important variations, which are now responsible for needlessly heavy injury to roads maintainable by authorities already severely handicapped by the rapidly increasing expenditure due to the growth of general traffic. The introduction of the trackless trolley system between Leeds and Bradford is a new departure in this country which will be closely watched, as the possibilities it opens out, if successful, are considerable. The question of contribution to road upkeep by the owners of these vehicles is one that will merit consideration.

THE DUTIES OF MUNICIPAL ENGINEERS.

Recent additions to the municipal engineer's duties include those imposed by the Housing and Town Planning Act, and much progress has already been made in the difficult task of providing habitations for residents of the poorer class whose present abodes are required for widening or new street construction in congested parts of great towns; also in laying out and developing entirely new towns or colonies in rural surroundings; but in the latter case it is not certain that all recent enterprises have improved upon the ordinary suburban road or house, either in general arrangement, quality of work, or general effect. The adjustment of artistic aspirations to the essential requirements of modern by-laws is often difficult, sometimes impossible.

The duties and responsibilities of the local government engineer are ever increasing, the requirements of the public become more exacting, and the area of municipal work is constantly extended. It requires, therefore, ceaseless activity on our part to be abreast of the times and to make ourselves conversant with all recent developments in our profession, so that our authorities can, with every assurance, rely upon their officers when work of such a character is contemplated.

In the preparation necessary for this contingency our institution has a record of excellent service, the numerous visits paid to towns throughout the country having enabled members to inspect works of the latest and most modern types of which their designers have unreservedly afforded complete and minute descriptions.

That this practice will continue and develop I have not the least doubt, and its existence will add to the usefulness and power of this institution.

LOCAL AUTHORITIES' EXPENDITURE.

The increase in the expenditure of local authorities continues as new duties and responsibilities are placed upon them by the inevitable demands of a higher civilisation, and it is a matter of vital importance that the liabilities of the present and future ratepayer be fully considered and equitably adjusted.

The growth in expenditure defrayed by loan has been phenomenal, and the proportion of present-day rates required to meet these charges is rapidly increasing.

It is a matter worthy of serious examination whether the ease with which loans can be resorted to is not at times responsible for expenditure not entirely necessary and upon work of limited durability.

Consideration is desirable to the probabilities of future developments and discoveries superseding much of our modern practice, so making useless many undertakings upon which the loan charges have still to be paid, and which would in such cases be a burden upon our successors, who would presumably have, in addition, the responsibilities of their generation to meet.

THE INSTITUTION ORPHAN FUND.

No annual address is complete unless reference be made to our voluntary organisation for the relief of our helpless little orphans. Instituted by one of our most esteemed past-presidents, whose labour of love must assuredly be accounted not the least of his life's good works, this fund has accomplished much already in providing for and educating little ones made orphans by the decease of the breadwinner; and the information laid before the committee in these cases is of such a heartrending character that it has been a matter of extreme difficulty in many instances to afford relief in any degree adequate to the requirements.

Need I repeat that additional subscribers will be welcomed, however divergent the amounts they find it practicable to contribute, and that the entire income of the fund, less postages, is actually expended in direct relief to children of deceased members whom many of us have known, admired, and mourned.

CONCLUSION.

In conclusion, may I be allowed to thank you for placing me in this proud position, an honour which I prize more than words can express?

To profit by the example of the many illustrious men who have occupied this chair is my ambition. To equal their achievements is impossible; but with the assistance of the council and officials, and your generous forbearance, I will endeavour to discharge the duties pertaining to my position with the wholehearted desire to encourage our younger members, to promote the best interests of all, and to increase the usefulness and prestige of our institution.

Votes of thanks were passed to the president for his address, and to Mr. A. D. Greatorex for his services as president during the year.

(To be continued.)

ORPHAN FUND MEETING.

Mr. A. D. Greatorex, the retiring president, occupied the chair at yesterday morning's general meeting of subscribers to the Orphan Fund.

The minutes of the previous meeting having been read and confirmed, Mr. O. Claude Robson, the hon. secretary and treasurer to the fund, presented the

ANNUAL REPORT.

To the Subscribers to the Orphan Fund of the Institution of Municipal and County Engineers.

Gentlemen,—Your committee beg to report that while but little improvement can be recorded in connection with the subscriptions received towards the fund during the year ended December 31, 1911, they are nevertheless pleased to report that no serious diminution occurs in the annual income during the year, the amount subscribed having been £128 5s., as compared with £144 1s. 9d. in 1910, while the number of subscribers has been 149—a three less than in the preceding year.

Every endeavour has been made by circular and otherwise to augment the number of subscribers to the fund, so that the list may show a better proportion to the numbers enrolled upon the books of the Institution, but unfortunately the numbers remain very similar to those of previous years. It is, however, attributable to report that three members fallen out of the roll have paid their subscriptions, so that the list is but slightly reduced, while it has been found possible to provide grants to all those applying, to invest a further £50 in London County Stock, and to carry forward a balance of £120 1s. 1d.

The grants made have rendered assistance to six widows of late members of the institution towards the schooling and maintenance of their children, while one child still remains at the British Orphan Asylum, for which a presentation was purchased on May 15, 1909, for a period of seven years. Thus it has been possible for your committee to provide assistance towards the maintenance of thirteen children during the year, and they have also been enabled to satisfy all claims of a justifiable character that have been made upon the fund.

The market value of the stock invested at the end of the year was somewhat less than at a similar period in 1910, but owing to an additional investment during 1911 the dividends received were slightly more. The accompanying balance-sheet summarises the condition of the fund at the end of the year 1911.

The amended title of the Institution of Municipal and County Engineers necessitated a similar alteration in the title of the fund, which was duly effected at a special general meeting of subscribers, held on August 18, 1911, and the rules and regulations governing the fund were altered accordingly.

Your committee have to express their regret at the lamented death of the late Mr. J. T. Eaves, who had been a trustee of the fund from its inception, and had at all times taken an earnest and generous interest in its work. It will be necessary by Rule 26 to appoint

a new trustee in his place, for which purpose a special general meeting of the subscribers will be held after this meeting.

Your committee append a list of subscribers to the fund at the end of the year 1911, and would take this opportunity to again express their thanks to the secretaries of the various districts for the assistance they have at times rendered towards augmenting the fund by application for subscriptions at the vari-

Mr. J. S. BRODIE (Blackpool) seconded the adoption of the report.

Mr. E. WILLCOCKS (Newcastle) thought the hon. secretary and treasurer was to be complimented on the position of affairs disclosed by the report before the meeting. Although they had dealt with thirteen cases during the year, they were able to show a balance of no less than £130. It was clear that they had not gone back in any way; the decrease in subscriptions was so slight that it was really not worth troubling about.

Mr. W. NISBET BLAIR (St. Pancras) said an important point to remember was that the assistance rendered by the fund had been given without reducing their invested capital.

Mr. R. L. THOMAS (Barking) congratulated the [illegible] an admirable balance-sheet with respect to the expenses [illegible] amounted to [illegible] —a wonderfully small percentage. Everything else had gone to the orphans.

The report was approved.

It was announced that Messrs. Cockrill, Hedley Jones and Willis had been elected to fill vacancies on the General Committee.

Mr. G. W. LACEY (Oswestry) proposed [illegible] Mr. O. Claude Robson as hon. secretary [illegible]

Mr. E. WILLCOCKS (Newcastle) seconded the proposition, which was carried.

Mr. ROBSON, in acknowledging the compliment, said he would do his best to carry on the work of the fund in the same way as his predecessor had done.

Mr. J. A. BRODIE (Liverpool) proposed a vote of thanks to the auditors, Messrs. Drew & Co., for their services.

Mr. W. NISBET BLAIR (St. Pancras) seconded the motion, which was carried.

Mr. R. L. THOMAS (Barking) proposed a vote of thanks to the chairman, Mr. Lacey, for presiding at the meeting.

Mr. LACEY, in acknowledging the compliment, said he would like to see the fund increased to £2,000, and he hoped that the subscribers would do their best to bring about that result.

Mr. E. WILLCOCKS (Newcastle) seconded the motion, which was carried.

who had anything to do with the fund would appreciate the value of the work done by Mr. Robson.

Mr. R. J. Thomas, in seconding, said it was difficult adequately to convey the extent of Mr. Robson's personal interest in the cases which came under his notice in connection with the administration of the fund.

The proposition was unanimously agreed to, and Mr. Robson returned thanks in brief terms. He could only say what he had said before, that he would do his level best in the interests of the fund. He must confess that he was somewhat disappointed that the list of subscribers was not a little more commensurate with the number of their members, but it was satisfactory that up to the present at any rate they had been able to meet all the claims which had been made upon the fund.

A special general meeting was held for the purpose of appointing a trustee to the fund in the place of the late Mr. J. T. Eayrs, Mr. S. Stallard (Oxfordshire) being unanimously selected.

The proceedings closed with a vote of thanks to the Chairman, who, in acknowledging the compliment, expressed the hope that the recent formation of district committees of the institution would result in a material increase of subscriptions to the fund.

THE NEW PRESIDENT.

Mr. R. J. Thomas, county surveyor, Buckinghamshire, the newly installed president of the Institution of Municipal and County Engineers, served his articles with his father, the late Mr. J. Thomas, county surveyor, Carnarvonshire, and after filling minor appointments at Croydon, Salisbury, and Carlisle, became engineer-in-charge of the restoration of the Shrewsbury and Holyhead Road when that highway came under the control of the county of Carnarvon. On the death of his father, Mr. Thomas was appointed county surveyor, holding that position until 1890, when he obtained his present appointment. He developed the system of direct maintenance in Buckinghamshire, where the main roads now exceed 500 miles in length, and organised the County Council's extensive scheme for contributions to district highways. In addition to numerous county bridges, he has erected, among other structures, court houses and police buildings, and carried out extensions to the lunatic asylum. Mr. Thomas is a member of the Institution of Civil Engineers, and a past president of the County Surveyor's Society.

A portrait of the new president accompanies this issue of The Surveyor in the form of an inset.

A RETROSPECT OF THE INSTITUTION.

By a Surveyor *Contributor.*

Early in the year 1870 the late Mr. Lewis Angell, M.Inst.C.E., then the surveyor of Stratford, London, wrote to the chairman of a Royal Sanitary Commission, then sitting on the preparation of the Public Health Act, 1875, calling attention to the unprotected position of the surveyor of a local board as compared with that of Poor-law officers, and suggesting that there should be an appeal to some Government office. The Local Government Board was not in existence at that date. He pointed out that he had no personal grievance, but he hoped that his suggestion would receive the consideration of the Commission. It is hardly necessary to say that no notice was taken of this appeal, and the commission made the following recommendation, the principle of which was eventually adopted in the Act of 1875: "That the officers of every local health authority should be appointed and removed by such authority; but medical officers of health should be appointed subject to the veto, and should not be removed without the sanction of the central authority; and inspectors of nuisances should be removable either by the central or local authority."

It is not the object of the present article to deal with the gross injustice of this decision, which appears to have been arrived at without hearing any evidence on behalf of the surveyor. But to pass on to Mr. Angell's next step. He circularised the whole of the surveyors in England and Wales asking them to unite for the purpose of protection, and suggesting the formation of an "Association of Local Board Surveyors." In reply to this circular Mr. Angell received "an immense number of letters of approval," and he then proceeded to write to various Government departments on the subject of protection. But, of course, nothing came of it.

However, the outcome of this loyal energy on the part of the late Mr. Angell was the formation in the year 1873 of the "Association of Municipal and Sanitary Engineers and Surveyors."

The inauguration of this important association was, as is often the case, quite simple. A meeting was held in March, 1871, in Mr. Angell's office, at which only Mr. Greatorex of Portsmouth, Mr. Jacob of Bromley, Mr. Monson of Acton, Mr. Angell of West Ham, and Mr. Jones of Ealing were present. Of these pioneers only Mr. Jones survives, and it is very interesting to note that he still retains his then position at Ealing, where he is held in the greatest respect. As far as "protection" is concerned there appears to have been no need for any anticipatory selfish motives in Mr. Jones' association with the movement. Mr. O. Claude Robson, of Willesden, who is still with us, should also be recalled as the first honorary secretary of the new body, of which he became president in 1898-9, and in connection with which his name will be honourably associated for all time in connection with the establishment of the Benevolent Fund.

In April, 1871, a conference of surveyors was held and a committee was formed.

In February, 1872, there was a general meeting, and a memorial was presented to the Local Government Board praying for "protection." It was signed by 135 surveyors, and a deputation was subsequently received by the then President of the Local Government Board, who heard their views, and in reply expressed his sympathy with the position and the grievances of local officers, suggesting at the same time, however, that if such protective clauses were inserted in the Bill [the subsequent Act of 1875], its passing might be jeopardised! So, of course, nothing came of it.

In February, 1873, a general meeting of local surveyors was held, and the formation of an association was unanimously agreed upon, as well as the rules, and the "Association of Municipal and Sanitary Engineers and Surveyors" sprang into life.

The inaugural meeting was held in May, 1873, was very largely attended by surveyors from all parts of England and Wales, and at this meeting the first council was formed, and consisted of the following—names which will interest those of us who have watched the great developments in municipal engineering during the thirty-nine years which have passed since this historic meeting was held. They are as follows: Angell of West Ham, Ashmead of Bristol, Dunscombe of Kingston-upon-Thames, Ellice-Clark of Ramsgate, Fowler of Salford, Greatorex of Portsmouth, Grindle of Hereford, Hornibrook of Reigate, Jacob of Barrow-in-Furness, Jones of Ealing, Lemon of Southampton, Lockwood of Brighton, Lynde of Manchester, Morant of Leeds, Stephens of Leicester, Thompson of Derby, Thorburn of Birkenhead, Marshall of Tottenham, and Wheeler of Boston. How many of these names now remain in the books of the institution? Certainly, with the exception of Mr. Jones, of Ealing, there is not a single one of the above-mentioned authorities which has not now another name as that of its surveyor!

In the year following there was published the first balance-sheet, which showed an income of £270 [practically for two years] and an expenditure of £203. It is interesting to compare this with the balance-sheet for this year, which shows an income for 1911 of £2,383, and an expenditure of £2,407, the slight excess of expenditure over income being merely due to exceptional circumstances.

Nothing of importance seems to have occurred in the history of the association until the year 1880, when Mr. Thomas Cole was unanimously appointed secretary, an office which he has since held with conspicuous ability and courtesy, and the growth and success of the institution has been in no small measure due to his efforts. It may be of interest to note that for this same year the income was £262, and the expenditure was £329. The following year the income was £216 and the expenditure £191, showing that the work of the newly appointed secretary had tended to the showing of a balance on the right side, and this seems to have happily continued ever since.

The examinations for diplomas in municipal engineering [illegible] instituted about this date (in 1884), and further activities followed.

In the year 1889 it was resolved that the association should be registered under the Companies Act, and in the following year this was carried into effect. It is interesting also to note that in this year the association was able to invest, for the first time,

The Surveyor

And Municipal and County Engineer.

moneys that had been saved by careful administration of its affairs. From this year also, until the year 1909, the institution was known as "The Incorporated Association of Municipal and County Engineers," it having been resolved to include county surveyors in the membership of the association.

Nothing of importance seems to have happened in the unbroken record of success until the year 1910, when it was decided, after considerable discussion, again to change the title of the association to that of "The Institution of Municipal and County Engineers," the name which it now bears.

The roll of the institution now contains the names of members representing nearly all the more important towns of Great Britain, as well as those of the engineers and surveyors of counties, urban and rural districts, and many Colonial municipal engineers—in fact, nearly all those who are eligible for election. It would be impossible in the limits of an ordinary article even to epitomise all the excellent work which the institution has from time to time carried out. Suffice it at present to say that the institution, born in 1873, has now passed a vigorous manhood and nearly forty years of existence, and that it is hoped that the coming year will see a further active growth under the able and energetic guidance of its new president, Mr. R. J. Thomas, the well-known county surveyor of Bucks, and its representative vice-presidents and council.

Compulsory Open Windows.—Chelmsford Rural District Council this week made an order compelling owners of cottages to make it possible for their windows to open. It was stated that some cottage windows had never been opened, as they were not made to open.

Lincoln Water Supply: New Works Completed.—The city of Lincoln's new water supply scheme, which has cost £225,000, was practically completed on Wednesday, when the Mayor turned on the valve of the Bracebridge Heath reservoir. The reservoir has cost £27,000. It has a capacity of 60,000,000 gallons, equal to more than a three days' supply for the city.

STOCKPORT WATERWORKS.

INAUGURATION OF KINDER RESERVOIR.

Yesterday saw the inauguration of the Kinder reservoir works of the Corporation of Stockport.

When in 1899 the corporation acquired the water undertaking the area of supply was rather more than 70 sq. miles in extent, and the population supplied numbered about 140,000; the quantity of water available was some 3,250,000 gallons a day. The corporation then decided that the existing supplies, obtained from works at Lyme Park, Disley, and Wilmslow, coupled with water available from Manchester, were insufficient for the growing needs of the district, and in 1901 necessary Parliamentary powers were obtained for the construction of works on the Kinder, Rett, and Hollingworth Clough streams, in the neighbourhood of Hayfield. The rainfall here has been found to be on the average about 45 in. a year, and the supply to be obtained is expected during a drought to amount to between 4,000,000 and 5,000,000 gallons a day.

The new reservoir has a capacity of 515,000,000 gallons and an area of about 44 acres. It is at the foot of Kinder Scout. The embankment by which the reservoir is formed is nearly 1,200 ft. in length, and the height from the bed of the river to the top is about 116 ft. At the ground level the maximum width is 590 ft., and the width at the top 14 ft. Provision has been made for dealing ultimately with 5,000,000 gallons a day. The water, after being filtered, will pass into two tanks adjoining the south side of the filter-house, with a capacity of 1,250,000 gallons each.

The works have been carried out by Messrs. G. H. Hill & Sons, engineers, of London and Manchester, with Mr. Basil Mackenzie as works manager, and Mr. A. M. Fairbairn as resident engineer.

L.C.B. and Proposed Municipal Golf Course.—On the ground that the price is excessive, the Local Government Board have refused a loan of £10,000 applied for by Yarmouth Town Council in connection with a golf course scheme. The council proposed to acquire 85 acres of sandy denes along the seashore between Yarmouth and Caister. The trustees of the Yarmouth Golf Club, which has amalgamated with the Caister Golf Club, in order to provide a full 18-hole course, proposed to sell this land to the corporation for £10,000, and then to take it on a thirty years' lease from the corporation, at an annual rental of £300, the land reverting at the end of the term to the corporation, who proposed to take the old golf links and make a municipal course.

Paris Housing: £8,000,000 Loan.—The Government Bill authorising the loan of £8,000,000 voted by the municipal council for the construction of cheap dwellings has been signed by the President of the Republic, and was laid upon the table of the House on Tuesday. Out of the proceeds of the loan the City of Paris will lend £2,000,000 to societies for the construction of cheap dwellings. The residue will be applied by the Municipal Council to the construction, the acquisition, or the sanitary improvement of buildings containing lodgings. Two-thirds of these lodgings, calculated according to the rental value, are to be reserved for families with more than three children under sixteen. The rest will be fixed within the maximum and minimum limits determined by the Cheap Dwellings Act now being discussed by the Chamber.

Municipal Engineering (Edited by Sydney G. Turner, ASSOC.M.INST.C.E. Price 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.).—This volume consists of model answers to questions set at recent examinations of the Institution of Municipal and County Engineers, and is the second edition. It is practically identical with the first issued. It is not suggested that it should take the place of recognised text-books, but it provides useful summaries of various subjects, as well as indications as to how different types of questions may be answered. Every effort has been made to render the answers as accurate and comprehensive as possible, though they contain more than a candidate would be expected to supply. The answers are founded upon examinations held in Birmingham, London and Manchester. The appendix contains examples of questions on sewerage, sewage disposal, tramway construction, bridges, water supply, road construction, buildings, sanitary science as applied to towns and buildings, drainage, and other matters. It will be seen, therefore, that the book is comprehensive, practical and exhaustive.—*Local Government Journal.*

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Balby U.D.C. (June 19th. Mr. R. G. Hetherington).—£1,373 for works of sewerage and surface-water drainage. The extension of the council's sewerage works has become necessary through the overflow of the Doncaster population into the Balby-with-Hexthorpe area, and the increase in the population brought about by the sinking of the Yorkshire Main Colliery in the adjoining parish of Edlington. Mr. G. Gledhill, surveyor to the council, said it was proposed to proceed with the sewerage for the new houses built as early as possible, as some of the houses were practically completed, and the owners wanted to let them. The council had accepted a contract for £1,415 for the whole of the work. With regard to the future, Mr. Gledhill said that in Balby they would eventually draw into the Balby area 6,063 houses, and into the new area 6,065, making a total of 12,128 houses. Hexthorpe is mainly drained through the Doncaster Corporation system. Dr. Wilson, of the West Riding Rivers Board, expressed the opinion that in the next ten years Doncaster and district would increase more than any other part of the West Riding. The surveyor submitted and explained the plans, which concluded the inquiry.

Bray U.D.C. (July 3rd. Mr. P. C. Cowan).—£10,000 for the purpose of erecting working class lodging houses, and £1,000 for laying new water mains. It was stated that at various times the council had erected houses, and now owned in all some ninety-one houses. Mr. P. H. McCarthy, surveyor to the council, also gave evidence.

Chelmsford T.C. (June 25th. Mr. Edgar Dudley).—£840 for the purpose of defraying the council's share of the cost of widening Baddow-road, and £3,920 for widening and improving Rectory-lane and New-street. With regard to the former amount, the town clerk, Mr. W. Smith, explained that it was required for the purchase of the Old White Hart premises, in order to widen a dangerous corner at the entrance to Baddow-road from High-street. Referring to the Rectory-lane and New-street widening, the town clerk said there was an extraordinary amount of traffic along those roads, and, as the Rectory estate was being sold for building purposes, the council thought it most essential that they should avail themselves of an opportunity for widening the road. The surveyor, Mr. T. P. Harrison, gave details as to the proposal to put down a special paving in New-street, from the point where the present wood paving ends.

Southampton T.C. (July 5th. Mr. F. H. Tulloch).—£12,653 for street improvement. There was no opposition, and Mr. R. R. Linthorne, the town clerk, and Mr. J. A. Crowther, the borough engineer, formally stated their case. At the conclusion the inspector visited and examined the roads in respect of which the loans were asked.

Waterloo-with-Seaforth U.D.C. (July 3rd. Major J. Stewart).—£10,750 for the purchase of property for the widening and improvement of Crosby-road North, Mount-pleasant, and Seaforth-road. Mr. H. P. Cleaver appeared on behalf of the council, and stated that to carry out the improvements it was necessary to acquire certain business premises as well as dwelling houses. They were not leaving derelict land at any point, but were utilising everything.

APPLICATIONS FOR LOANS.

Atherstone R.D.C.—£3,000 for the provision of twelve [illegible]

Burnley T.C.—£197 for alterations to a school.

Carnarvon T.C.—£500 for a brick chimney stack for [illegible]

Chester T.C.—£4,000 for a sewerage scheme.

Darlington T.C. [illegible]

Driffield R.D.C. [illegible]

Hadleigh U.D.C. [illegible]

Harrogate T.C. [illegible]

Hereford T.C.—£1,000 for laying electricity services.

Horwich U.D.C. £1,827 for new streets, £570 for street [illegible]

Meriden R.D.C.—£200 for the extension of the water mains.

Middleton T.C.—£5,200 for electricity cable required during the ensuing five years.

Newbury T.C.—£3,310 for the purposes of school provision.

Poole T.C.—£300, a further loan for a steam disinfector, making £1,075.

Quorn U.D.C.—£503 for alterations to the Hall.

Romford U.D.C.—£520 for a road improvement.

Rye T.C.—£300 for a caretaker's house at the cemetery.

Stoke-on-Trent T.C.—£1,928 for a school site.

Stroud U.D.C.—£1,000, further loan for sewage disposal works.

Walthamstow U.D.C.—£1,984 for alterations to school buildings.

Wednesbury T.C.—£1,000, additional loan for extension to the municipal offices and public baths, making a total of £6,000.

Woolwich B.C.—£50,000 for the electricity undertaking.

LOANS SANCTIONED.

Acton U.D.C.—£1,000 for fire hydrants.

Bacup T.C.—£2,555 for repaving with granite setts.

Belfast T.C.—£10,000 for motor fire appliances.

Billericay R.D.C.—£800 for a sewerage scheme.

Brighton T.C.—£8,700 for the redemption of mortgages and debenture debts.

Chapel-en-le-Frith R.D.C.—£4,000 for a new reservoir.

Chichester T.C.—£875 for making up two streets.

Clacton-on-Sea U.D.C.—£2,122 for paving the cliff promenades.

Harrogate T.C.—£3,307 for public baths extensions.

Hastings T.C.—£10,000 for road widening and constructing new roads.

Selby R.D.C.—£300 for water supply works.

South Shields T.C.—£6,484 for street repairs.

Teddington U.D.C.—£1,890 for making up Blackmore's-grove and Cambridge-road under the Private Street Works Act.

Torquay T.C.—£7,000 for the extension of electricity mains.

FORTHCOMING INQUIRIES.

JULY.	£
16.—**Barnard Castle.** For water, sewerage, and public convenience purposes (Mr. A. A. G. Malet)	2,971
16.—**Barrow-in-Furness.** For electricity purposes (Mr. T. C. Ekin)	22,000
16.—**Exeter.** For a housing scheme (Mr. Wm. Henry Collin)	8,847

A Vacuum Street Cleaner.—The tramway tracks in the city of Strassburg will hereafter be cleaned by means of a vacuum cleaner recently adopted. In form and appearance it resembles a box car, and is equipped with drive and vacuum cleaner motors. The dirt is first sprinkled and then sucked up into the car by the vacuum apparatus. This device enables one man to clean 25 miles of track per day, which is equivalent to the output of seventeen men under old conditions.—From *Engineering and Contracting.*

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Glasgow £150,000, Lurgan £10,000, Poole £2,823; housing and town planning—Hendon; refuse collection and disposal—Pontypool; roads and materials—Woolwich £3,500; sewerage and sewage disposal—Bognor £10,480, Oakengates £13,450; Rainham £10,750, Whitstable; miscellaneous — Leamington, Ramsbottom.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Beverley T.C.—The Mayor (Captain H. Samman) has given a site for public baths.

Birmingham T.C.—The bridge in Aston Church-road is to be reconstructed and the approaches widened and improved.

Coventry T.C.—The tender of Garlicks, Limited, at £2,433, has been accepted for the construction of a public mortuary.

Dumbartonshire C.C.—A site has been purchased near Drumchapel for the erection of a small-pox hospital.

Dundee T.C.—The Lochee branch public library has been reconstructed, at a cost of £1,300.

Essex C.C.—The tender of Mr. A. E. Symes, of Stratford, at £16,777, has been accepted for the erection of a new secondary school at Southend. The tender of Messrs. Clemens Brothers, at £2,575, has been accepted for additions to the asylum.

Frome R.D.C.—The reservoir at Wurry Catch is to be enlarged, at a cost of £160.

Glasgow T.C.—The council have approved of the general conditions for the competitive designs to be invited from outside architects for the proposed extension of the municipal buildings. Mr. John J. Burnet, LL.D., A.R.S.A., has been appointed by the corporation to act for them in the competition, which closes on October 29th. The corporation are advised that a building suitable for their requirements should be obtained for £150,000, including the expense of alteration of the existing building.

Greenock T.C.—A committee of the town council has recommended the provision of public baths and washhouses in Ann-street.

Ilford U.D.C.—The surveyor, Mr. H. Shaw, has been instructed to confer with the Wanstead surveyor, Mr. C. H. Bressey, with the object of preparing designs and estimates for the construction of a 50-ft. bridge to take the place of the existing Red Bridge.

Lichfield T.C.—The new central school in Frog-lane is estimated to cost £3,300. Mr. Fred. T. Beak, of Wolverhampton, is the architect, and the contractors are Messrs. Thornloe & Sons, of Lichfield.

Lurgan U.D.C.—An industrial dwellings scheme is to be carried out, at a cost of £10,000.

Poole T.C.—A new infants' school is to be built, at an estimated cost of £2,823.

Spalding R.D.C.—The tender of Mr. G. Barnsdale, at £998, has been accepted for the erection of six cottages.

Staffordshire C.C.—The tender of Mr. W. Roe, of Wolverhampton, at £4,387, has been accepted for the erection of a new school at Upper Penn.

Woolwich B.C.—The tender of Messrs. E. Proctor & Sons, of High-street, Plumstead, at £1,050, has been accepted for the construction of an underground convenience in Beresford-square.

HOUSING AND TOWN PLANNING.

Hendon U.D.C.—In accordance with a suggestion by the Local Government Board, the council have amended plans for the erection of artisans' dwellings by increasing the number of bedrooms from two to three.

Merton U.D.C.—The surveyor, Mr. G. Jerram, will submit to the Housing and Town Planning Committee particulars of a scheme embracing the whole of the West Barnes Ward, and such portions of the Bushey Mead Ward as may, in his opinion, be advantageously dealt with at the same time.

PARKS AND OPEN SPACES.

Whitby U.D.C.—It has been decided to purchase the Spa and grounds, extending from Khyber Pass to near White Point, for £4,550, including the cliff face, sands and foreshore, and to ask for five years in which to make a marine drive from beyond the Metropole Hotel to the existing road near White Point.

REFUSE COLLECTION AND DISPOSAL.

Leith T.C.—It has been agreed that the scavengers' wages should begin at 24s. per week, rising to 25s. at the end of six months, and to a maximum of 26s. at the end of twelve months, with 2s. extra when on duty on Sundays. The men are also to be given three days continuous holidays in the year.

Pontypool U.D.C.—A proposal to construct a refuse destructor, at a cost of £1,500 has been rejected, and alternatively it has been decided to seek a new tipping site.

Ramsbottom U.D.C.—A tender has been accepted for the erection of a refuse destructor and steam disinfector, at an estimated cost of £4,300.

Wednesbury T.C.—A disinfector is to be provided, at an estimated cost of £350.

ROADS AND MATERIALS.

Banff C.C.—It has been agreed by the Upper Banffshire District Committee to carry out improvements at the part of the main road at Tomnavoulin termed "Sojers' Hill," at an estimated cost of £125, exclusive of haulage.

Middlesex C.C.—The following proposed works have been approved. Relaying with creosoted deal woodblocks the wood paving in Willesden-lane (main road), Willesden, £1,052; one-fourth of the cost of relaying with creosoted deal wood-blocks the wood paving in Canterbury-road, Willesden, £187; a moiety of the cost of relaying with creosoted deal wood-blocks the wood paving in Salusbury-road, Willesden, £72; and a moiety of the cost of substituting rock asphalt for creosoted deal wood-blocks in Malvern-road, Willesden, £1,455.

Perth T.C.—The Work and Paving Committee have presented a report recommending the council to purchase a bituminous mixing plant.

Southport T.C.—The widening of Lord-street, for which a loan of £700 was sanctioned, has been completed. The cost is inclusive of £200 for the purchase of the necessary land.

Woolwich B.C.—Powis-street is to be repaved with wood blocks at a cost of £3,500.

SEWERAGE AND SEWAGE DISPOSAL.

Arundel T.C.—The surveyor, Mr. E. F. Farrington, has been instructed to prepare plans for alternative schemes for sewers in South Marshes.

Belfast T.C.—The Improvement Committee have accepted the tender of the British Welding Company, Glasgow, for the supply of cast-iron pipes in connection with the drainage works.

Bognor U.D.C.—A scheme of sewerage, estimated to cost £10,480, has been adopted. The proposed works include an outfall pipe (£6,440), building and sumps (£2,530), and engines, pumps and elevator (£1,510).

Epsom R.D.C.—The Local Government Board have written stating that the subsoil of the land proposed to be purchased for the extension of the sewage works is clay, and therefore unsuitable, and that the council should consider whether it would not be better to construct additional filters on the present site, and that on this the council should consult an experienced engineer, a copy of whose report should be sent to the board. The council last week decided to inform the board that the land in question is exactly similar to that on which are the existing works, and that the contract to purchase it lapses by the 21st inst.

Hove T.C.—The Works Committee recommend the council to accept the tender of Messrs. Parsons & Sons, Hove, for constructing new sewers in Queen's-gardens, Grand-avenue, The Drive, Holland-road, and Davigdor-road at a cost of £6391; also that of the same contractor for carrying out new street works in Lorna-road (west end of Selborne-place) for £89.

Laurencekirk T.C.—The tender of Messrs. Wellwood & Lunan, of Bowhill, Cardenden, at £1,333, has been accepted for the construction of sewage disposal works.

Middlesbrough T.C.—The borough engineer, Mr. S. E. Burgess, reports that the Stockton-road sewer is almost completed, and that the cost would be £1,393, or £350 within the estimate. The work was carried out by the works department under the supervision of a clerk of works.

North Bromsgrove U.D.C. — At a council meeting recently Mr. Robert Green, M.Inst.C.E., of Birmingham, was instructed to prepare the necessary detailed drawings, &c., for submission to the Local Government Board for sewering and dealing with the sewage of Plymouth-road, Twatling-road, Station-road, and Fiery-lane, Barnt Green.

Oakengates U.D.C.—Proposals for sewerage extension are estimated to cost £13,450. The engineers are Messrs. Berrington, Son & Watney, of Wolverhampton.

Rainham U.D.C.—A sewerage and sewage disposal scheme is to be carried out at an estimated cost of £10,750. The engineer is Mr. S. B. Grant, of Sittingbourne.

Romford U.D.C.—A Blackstone crude-oil engine of the H.C. type and 45 b.h.p. is to be provided at the sewage farm at a cost of £325.

Whitstable U.D.C.—The council have adopted the scheme for the treatment and purification of the sewage prepared by Mr. Weeks, of Messrs. Strachan & Weeks, of Westminster.

WATER, GAS, AND ELECTRICITY.

Alnwick U.D.C.—The tender of the Alnwick Gas Company, at £507, has been accepted for a period of five years for lighting the town.

Ashby R.D.C.—The tender of Messrs. W. Moss & Son, of Coalville, at £170, has been accepted for laying on the Coalville water to the New Swannington area.

Belfast T.C.—The report of the Gas Committee on the past year's working of the department states that, after paying dividends and sinking fund, they had set aside to reserve fund £20,000; insurance of works, £3,200; and contingent renewal fund, £6,000. They had also contributed £10,000 to the general purposes fund in aid of the rates, and £11,355 for the dividends and sinking fund of the new city hall, a total of £21,355, and they carried forward the balance of £19,353.

Billinge U.D.C.—In connection with the extension of the waterworks, the council have accepted the tender of the Staveley Coal and Iron Company for pipes, and the tender of Messrs. Blakeborough & Sons for fittings and special pipes.

Cardiff T.C.—Prospective unemployment is to be provided against, as far as possible, by the determination of the Waterworks Committee to continue the relaying of the mains during the ensuing winter, and also the cleaning of the filters at the Heath and Rhubina.

Falkirk T.C.—It has been arranged to alter the lighting system. Certain old burners are to be replaced by swan-neck burners, and each different type of burner is to be controlled by a meter of its own class. Round globes are to be replaced as occasion arises by square lanterns, and the whole lighting system is to be converted in two years according to a plan suggested by the burgh engineer.

Llandudno U.D.C.—It has been agreed to adopt an automatic street lighting and extinguishing apparatus with which the engineer had been experimenting, and on which he reported favourably. The apparatus will be adapted to fifty-three lamps, at a cost of £77 a year, and it is estimated that the annual saving will be £29.

Market Harborough U.D.C. — The remainder of the lamps not at present lighted and extinguished automatically are to be fitted with the "A & M" patent automatic-pressure controllers, at an estimated cost of £225.

Plymouth T.C.—A nett profit of £8,361 was earned by the water undertaking during last year.

St. Helens (Isle of Wight) U.D.C.—Plans, specifications and estimates have been approved for the construction of a reservoir on a field known as Broomlands, St. Helens, at an estimated cost of £1,600.

St. Pancras B.C.—The Electricity Committee recommend the acceptance of the tender of Messrs. Bruce, Peebles & Co., Limited, at £5,310, for two 1,000-kw. motor generators.

Selby R.D.C.—The Local Government Board have given their consent to an extension of the Cawood water supply scheme, at a cost of £300, the amount being paid out of the unapplied balance in hand.

Stockton T.C.—The extension of the gas undertaking, at an estimated cost of £30,000, is under consideration.

Stoke Newington B.C.—The tender of Messrs. Bruce, Peebles & Co., Ltd., at £1,720, has been accepted for a 400-kw. motor converter at the transformer station.

Sunderland T.C.—A nett profit of £5,957 is reported on the year's working of the electricity undertaking.

York T.C.—A report has been presented from the Gas Committee, giving the result of the negotiations with the gas company, which had been provisionally agreed to, subject to the approval of the corporation and Parliament. The undertaking to purchase includes all reserves, amounting to £25,000, which will be purchased at the figures at which they stand, with some floating balances and other funds, and all the works. The capital of the company is £42,000, yielding 4 per cent dividend, and is quoted at £93.

MISCELLANEOUS.

Barry (Glam.) U.D.C.—In furtherance of a proposed improvement scheme at Whitmore Bay, Barry Island, the surveyor, Mr. J. C. Pardoe, has been instructed to draw up an estimate of the cost of two schemes—(1) to cover the entrance to the sands and provide a shelter; (2) to provide a similar shelter, with six shops and a pavilion roof, which would form a further shelter, and for entrance to which a charge should be made.

Leamington T.C.—The Fire Brigade Committee have been authorised to purchase a motor fire engine, at a cost not exceeding £1,000.

Ramsbottom R.D.C.—Contracts for the construction of a railless traction service between Holcombe Brook and Edenfield will shortly be entered into by the council. The route is 3½ miles in length, and the cost is estimated at £10,000, which includes the installation of three cars, overhead fittings, waiting-rooms and car sheds. The estimated cost of running per mile is 8½d., which also includes sinking fund and interest charge and full equipment.

Tipton U.D.C.—The surveyor, Mr. W. H. Jukes, has submitted a list of quantities of provender used for four weeks, from which it appeared that the cost of horse keep amounted to 14s. 6d. per horse per week.

Oil Testing Machine. — The Stern Sonneborn Oil Company, Limited, Royal London House, Finsbury-square, E.C., have issued an illustrated pamphlet giving particulars of the Sternol oil testing machine. This machine is considered to represent an important step in the scientific testing of oils, as by its means comparative values of lubricating and cylinder oils and greases can be established under actual working conditions at the actual temperature and pressure the lubricants undergo in practical use.

Law of Private Street Works.—It is surely a commentary on our system of legislation relating to what may be termed domestic matters that the owner of house property (to say nothing of the occupiers of his houses) has to thread his way through a maze of statutes and decisions to ascertain his rights and his liabilities in connection with questions which may arise every day. Such, however, being the case, text-books dealing with what on the face of them might be deemed to be simple matters have become an actual necessity, although the owner of property is lucky if the text-book suffices and he is not driven to consult a specialist. The work before us* deals with one of such subjects, private street works under the Public Health Acts and the Private Street Works Act, 1882, but not with the Metropolitan Management Acts; the statements in the text are supported by decided cases, with references printed in the text; there is also a table of cases and an index, and it should prove a useful hand-book. We find the recent decisions included, and the work seems to have been carefully prepared.—*The Builder.*

* "Notes on the Law of Private Street Works under the Public Health Acts." By J. B. Reginier Corder, a Solicitor of the Supreme Court. 4s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

PERSONAL.

Mr. P. H. Palmer, borough surveyor of Hastings, has had his salary increased to £800 per annum.

Mr. Reginald Blomfield, A.R.A., F.S.A., has been elected president of the Royal Institute of British Architects, in succession to Mr. Leonard Stokes.

Mr. E. J. Harber, surveyor, civil and sanitary engineer, and estate agent, has removed from 118, Colmore-row to Union Chambers, 63 Temple-row, Birmingham.

Mr. J. Kirton, surveyor to the Withernsea (Yorks) Urban District Council, has been presented with a silver cake-stand, subscribed for by the members of the council and officials, on his approaching marriage.

Mr. A. E. S. Murray, assistant engineer of the outfall works of the West Kent Sewerage Board, has been appointed superintendent of the works, at an increased salary of £20 per annum, and has been provided with a motor-cycle.

Mr. B. Kilner, of Sedbergh, has been appointed highway surveyor to the Wetherby (Yorks) Urban District Council, in place of Mr. R. A. Watson, who has received a similar appointment under the Derby County Council.

Mr. P. M. Wakefield and Mr. C. K. Robertson, two members of the engineering staff of Mr. Charles J. Jenkin, M.INST.C.E., engineer and surveyor to the Finchley U.D.C., were last week successful candidates for vacant public positions, Mr. Wakefield being appointed assistant surveyor to the borough of Harwich and Mr. Robertson engineering assistant to the borough surveyor of Luton.

Mr. H. C. Phillips, surveyor to the Hursley (Hants) Rural District Council, apropos of the new scheme by which the county council have undertaken the direct maintenance of main roads in the council's district, has been informed that no alteration will be made in his salary as a consequence of the change. In addition the council complimented Mr. Phillips upon the ability he had shown in the performance of his duties.

Mr. Allan Waters, the city engineer of Nanaimo, British Columbia, was born in Sussex, in 1868, and was educated at the Collegiate School, Tunbridge Wells. On leaving school he was articled to Mr. S. W. Haughton, M.S.A., architect and surveyor, and upon the completion of his articles entered the office of a London architect and district surveyor. Later he acquired architectural experience in the Midlands, which he left for South Wales upon his appointment as assistant-surveyor to the Barry and Cadoxton local boards. Afterwards he entered the offices of the now defunct Metropolitan Board of Works. In 1893 Mr. Waters received an appointment on the staff of the director of works of the Admiralty, and in 1896 was made officer-in-charge at the Halifax (Nova Scotia) Naval Yard. Returning to England in 1899, after a short period at the Admiralty offices, he was sent out to the Island of Ascension, immediately before the outbreak of the Boer War, as engineer-in-charge of various works of fortification, water supply, and new buildings, and on his return to England he was awarded a gratuity for his services. Upon the termination of the Boer War Mr. Waters left the Admiralty and went to the Northern Transvaal to join three brothers who had served through the campaign, and among his various commissions was the preparation of reports on irrigation schemes and several important works of building construction. Later he accepted an engagement with Mr. D. Leitch, engineer of the Johannesburg Municipality. In 1906 he left the Transvaal for Australia, and having obtained an appointment with the Ferro-Concrete Company of Australia he proceeded to Auckland, New Zealand, where the company had extensive contracts from the Harbour Board for the reconstruction of large reinforced concrete wharves and docks. Upon the completion of this work Mr. Waters accepted a position with the City Engineer of Auckland, but in 1909 left there for British Columbia, and was appointed city engineer of Nanaimo after a short term with the Provincial Lands Department.

Institution of Water Engineers. — The concluding instalment of our report of the recent summer meeting of the Institution of Water Engineers is unavoidably held over until next week.

NORTHAMPTONSHIRE ROADS.

COUNTY SURVEYOR'S REPORT.

No alteration in or addition to the mileage of main roads in Northamptonshire is reported by the county surveyor, Mr. Charles S. Morris, in his recently published eleventh annual statement.

The total cost of maintenance (exclusive of improvements and Road Board work) was £25,319, which is £719 over last year, and £510 over the average for the past three years. The total cost, including improvements, was £26,480, which is £200 over last year, and £447 over the average for the past three years. This is accounted for by the fact that over 2,000 tons more metal was applied to the rural roads, while the cost of night watching during the progress of the work has also to be allowed for. The cost per mile, exclusive of improvements, was £79·54, and, inclusive of improvements, £83·19.

A total quantity of 28,405 tons of granite and granite chippings, 449 tons of local chippings, and 334 tons of slag chippings was purchased during the year, and practically the whole quantity applied to the roads. The total (29,188 tons) is the largest quantity applied in any year since the passing of the Local Government Act of 1888.

The three steam rollers have been regularly at work (except when stopped for repairs or by frost), and an additional roller was hired for a period of seventeen weeks. The total quantity consolidated was 27,120 tons, at a cost of £649 19s. 7d., or slightly under 6d. per ton (5·72d.). The expenditure includes £30 for steel plating the driving wheels to one of the rollers.

The carrying out of the Road Board schemes has largely increased the work of Mr. Morris's department, as the greater part of the work, involving an expenditure of £7,293, was carried out by his staff. The work of tar-grouting and surface tarring was carried through expeditiously, owing to the exceptional fine weather of the summer. The tar-grouting was carried out in various lengths upon all the most important roads, and their condition during the winter clearly showed the advantage of the system over water-bound roads.

The following statement gives the particulars of the tar-grouting done during the year:—

—	Urban districts.	Roads directly maintained.	Total.
Area treated ...	36,895 sq. yds.	134,816 sq. yds.	171,711 sq. yds.
Metal and chippings used	3,689 tons.	12,865 tons.	16,554 tons.
Total cost of grouting ...	£872.	£2,623.	£3,495.
Cost per ton of metal treated (including chippings)	4s. 6d.	4s. 1d.	4s. 2¼d.
Cost per yard super. ...	5·67 pence.	4·67 pence.	4·88 pence.
Average thickness of coating	3·14 in.	2·86 in.	2·90 in.

The surface tarring carried out on the main roads passing through the villages has proved a great boon and to a small extent increased the life of the roads, but the county surveyor points out that this is only a temporary measure, and that the difficulties which present themselves will not be overcome until the roads are recoated with metal treated with a bituminous binder.

Dangers of Deep Excavations.—The Home Office Departmental Committee appointed two years ago to inquire into the dangers of deep excavations has just issue a report. A series of regulations for excavations exceeding 10 ft. in depth is suggested by the committee, which recommends that the work should be under the direct supervision of a person of wide experience, that workings and gangways should be fenced, and that there should be a daily inspection.

Drainage Works and Sanitary Fittings.—A third edition, revised and brought up to date, particularly as regards the questions of concrete sewers, sewer ventilation and flushing, and the Public Health Acts Amendment Act of 1907, still further evidences the success of this little manual,* which manifestly deserves the attention and confidence of all concerned in the important subject with which it deals.—*The Bookseller.*

* "Drainage Work and Sanitary Fittings." By Wm. H. Maxwell, Price 2s. nett. London: St. Bride's Press, Ltd., 24 Bride-lane, E.C.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CITY OF BATH.

TWERTON AND WESTON SEWERAGE.

The Bath Corporation are prepared to receive Tenders from competent Contractors for the Construction of New Iron and Stoneware Intercepting Sewers, &c.

These works will comprise about 2,598 yards of main iron intercepting sewers varying from 24 in. to 9 in., 2,128 yards of 24 in. to 9 in. stoneware sewers; 220 yards of 4 ft. 6 in. diameter, 450 yards 3 ft., and 130 yards of 2 ft. 6 in. diameter brick culvert; 3,408 yards of 9 in. and 7 in. high level iron sewers; 2,900 yards of 6 in. and 4 in. flush water-mains; and 1,410 yards of replacement of old stone sewers by new iron and stoneware pipe sewers and other appurtenant works.

The plans may be seen and quantities obtained at the office of the Engineer, Mr. W. H. Radford, C.E., Albion Chambers, Nottingham, on deposit of Three Guineas, which sum will be returned on receipt of a *bonâ-fide* Tender and the return of the quantities.

The plans will also be on view at the City Surveyor's Office, Guildhall, Bath, on and after the 17th July, 1912.

The lowest or any Tender will not necessarily be accepted.

Sealed and endorsed Tenders to be sent in to the undersigned on or before July 29th next.

FREDK. D. WARDLE,
Town Clerk.

Guildhall, Bath.
July 8th, 1912.

BARNET URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

STREET-PAVING WORKS.

The Council invite Tenders for Works of Re-paving Re-kerbing, and Channelling in High-street, Barnet.

Persons desiring to submit Tenders may, upon depositing with the Council the sum of £2 2s., obtain copies of the Bill of Quantities and Specification, and inspect the drawings and obtain all information from Mr. W. F. Wilkins, Surveyor to the Council, at his office, No. 40 High-street, Barnet.

Such deposit will be refunded after the Council have come to a decision on the Tenders received, provided the person or persons obtaining the copies aforesaid have submitted a *bonâ-fide* Tender to the Council.

Tenders, on the Bill of Quantities supplied, sealed and endorsed "High-street Paving," must be addressed to the undersigned at No. 40 High-street, Barnet, and delivered not later than noon on the first day of August, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

HY. W. POOLE,
Clerk of the Council.

July 10, 1912.

CITY OF BIRMINGHAM.

The Public Works Committee are prepared to receive applications for the appointment of a thoroughly competent Road Foreman in the City Surveyor's Department. Wages 40s. per week, rising by annual increments of 2s. 6d. per week to 45s. Candidates must be fully qualified persons who have had recent practical experience in the construction, maintenance, and scavenging of the various classes of roads and streets of a large town; also in the management of large bodies of workmen. They must be able to keep clearly their note-books, set out works from plans, measure up works in course of construction, and prepare estimates.

The Candidate appointed will be required to devote the whole of his time to the service of the Corporation and to contribute to the Superannuation Scheme.

Applications, in Candidate's own handwriting, stating age which should not exceed 40, experience, past and present employment accompanied by copies of not more than three recent testimonials, and endorsed "Road Foreman," to be sent to the undersigned not later than Monday, July 22, 1912.

Canvassing, either directly or indirectly, will be a disqualification.

HENRY E. STILGOE,
City Engineer and Surveyor.

The Council House,
Birmingham.
July 11, 1912.

CANNOCK URBAN DISTRICT COUNCIL.

WASHING BACTERIA BED MEDIUM.

The Cannock Urban District Council invite Tenders for the Excavating, Removal, Washing and Replacing of Filtering Material in Bacteria Bed, &c., at their Sewage Farm, Longford-lane, Cannock.

Specification, Schedule, and Form of Tender may be obtained on application to Mr. Robt. Blanchard, Engineer and Surveyor, at the Council Offices, Cannock.

Sealed Tenders, endorsed "Tender for Washing Filtering Material," and addressed to the Chairman of the Sewage Farm Committee at the Council Offices, Cannock, are to be delivered not later than 10 a.m. on Friday, the 2nd day of August, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

Clerk to the Council.

Council Offices, Cannock.
June 19, 1912.

BOROUGH OF LUTON.

The Council of the Borough of Luton invite Tenders for the supply of Broken Granite and Broken Slag.

Specifications and Forms of Tender can be obtained on application at the Office of the Borough Surveyor.

Tenders, sealed and endorsed "Tender for Road Material," accompanied by samples of the materials proposed to be supplied, are to be delivered to Mr. J. W. Tomlinson, Borough Engineer and Surveyor, Town Hall, Luton, not later than noon on Saturday, July 20, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

BRUCE PENNY,
Town Clerk.

Town Hall, Luton.
July 10, 1912.

BARNET URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

PRIVATE STREET WORKS ACT, 1892.

The Council invite Tenders for the Making-up, under the above Act, of the Private Street within their District known as Normandy-avenue (1st Portion).

Plans and Specification can be seen and all information and Form of Tender obtained, on application to Mr. W. F. Wilkins, Surveyor to the Council, at his Office, No. 40 High-street, Barnet, any day during office hours.

Tenders, on Official Forms only, sealed and endorsed "Tender for Normandy-avenue," to be addressed to me and delivered at the Council Offices, No. 40 High-street, Barnet, not later than noon on Thursday, August 1st, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

HY. W. POOLE,
Clerk of the Council.

July 10th, 1912.

PUBLIC HEALTH ACT, 1875.

BRADFIELD RURAL DISTRICT COUNCIL IN THE COUNTY OF BERKSHIRE.

PARISH OF STRATFIELD MORTIMER.

TO WATERWORKS CONTRACTORS.

The Rural District Council of Bradfield are prepared to receive Tenders for the Construction of Waterworks in the Parish of Stratfield Mortimer, consisting of Water Mains, Engine House, and Water Tower.

Particulars and Forms of Tender may be obtained, and Plans may be seen, at the offices of the Consulting Engineer, Mr. H. Howard Humphreys, 28 Victoria-street, Westminster, S.W., on the 22nd day of July, 1912, between the hours of 10 a.m. and 5 p.m.

Intending Contractors will be required to deposit a sum of £5 prior to particulars being furnished, such sum being returned on receipt of a *bonâ-fide* Tender.

Tenders, endorsed "Waterworks, Mortimer," must reach the undersigned not later than 4 p.m. on the 29th day of July, 1912. The Council do not bind themselves to accept the lowest or any Tender.

Given under my hand this 9th day of July, 1912.

R. E. RAWSTORNE,
Clerk to the Council.

4, Bridge-street,
Caversham, Reading.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions: -

252. Girder Bridge —Design a girder bridge to carry a 24-ft. road over a river and railway (at an angle of 60°) of two spans, 70 ft. and 42 ft. respectively. The mean height of road surface above bed of river is 21 ft. 6 in., and 17 ft. above rails, and the foundation is clay. Please show calculations and give an estimate of the cost. ("Nomad.")

256. Leak in Drain Pipes.—What is a reasonable amount of leakage to be expected in newly laid stoneware drain pipes of 6 in. and also 12 in. diameter? State the type of joint, average depth of trench, and class of soil. Is one gallon per mile of pipe per hour a permissible amount? ("Welsh.")

258. Roof Design.—Is it necessary or advisable to allow for expansion and contraction in a roof of 50-ft. span? What is a simple and efficient arrangement for such a roof, assuming that this is required? ("Student.")

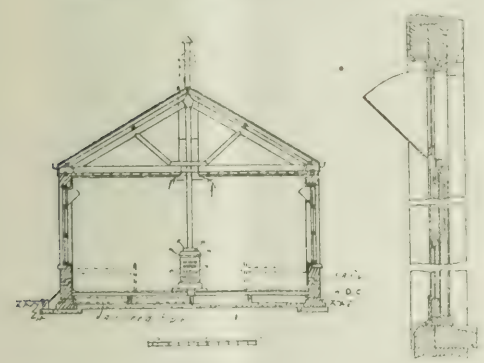
259. Mechanics.—What is meant by "Instantaneous centre of rotation"? Give an example. What points on the rim of a carriage wheel are moving at the same rate as the middle of the axle? ("A.M.I.C.E.")

260. Refuse Disposal.—Where there is no system of sewers in a district, what are the best methods of collecting, removing and disposing of the fluid and solid refuse from the community?

REPLIES TO QUESTIONS.

253. Hospitals.—Give a typical cross-section of an infectious diseases hospital ward. Specify for finishing the internal surfaces. Give detail sketches of a window. ("M. and C.E.")

The walls should be rendered in Keene's or similar cement, and all angles at door and window openings and at the junction of the floor, walls and ceiling should be neatly rounded. The walls should be painted three coats of bright coloured paint and finished off with one coat of good varnish. The floor should be laid with 7 in. × 1 in. tongued and grooved white floor boards well cramped together and spiked down. The ceiling should be plastered on metal lathing, the first coat, "coarse stuff," composed of 2 of sand to 1 of lime, with 1 lb. of long clean cow hair



to every 3 cub. ft., uniformly and evenly laid, and roughed to form a key; the second coat, "fine stuff," composed of slaked lime and fine sand with a little hair, applied as soon as the first is set. This should in turn be roughed with a birch broom, and the setting coat, of about ¼ in. of Keene's cement applied and trowelled to a smooth surface. (W. D., *Dudley.*)

257. Brick-plant.—Sketch and describe a plant for making bricks and flags from refuse destructor clinker. (T. R.)

T. R. will find sketches of plants for making bricks and flags from refuse destructor clinker in the Horsfall Destructor Co., Ltd., book on "Destructors."

The plant necessary for making clinker bricks consists of the following:—

(1) Perforated bottom grinding pan. (2) Lime slaking and mixing machine. (3) Moulding press. (4) Wagons, rails and steaming chambers. (5) Engine, shafting, piping and valves. (6) Weighing machine for proportioning the rough clinker and lime. (7) Barrow hoist for lime.

In this system the clinker is first crushed in a perforated bottom grinding machine, which grinds it and removes scrap-iron, nails, &c. The proper proportion of quicklime is added in this pan. The crushed clinker and lime is then conveyed by an elevator to the slaking and mixing machine, where it is treated with the minimum quantity of water which is chemically necessary in a steam-heated vessel, where it is also subjected to the action of low pressure steam and mechanically treated by means of a specially designed worm, actuated by gearing having a reversing motion. This treatment exposes the entire charge of the vessel to the full effects of the steam, and thus completes the process of slaking, the resultant material being mixed clinker and hydrated lime of exceeding fineness. From this machine the ground clinker and lime are delivered automatically to the feed hopper of the moulding machine. After moulding, the bricks are stacked on platform wagons and taken to the steaming chambers, where they are exposed to the action of steam at atmospheric pressure for a period of from 8 to 24 hours.

Flags. The plant necessary for making flags from the clinker consists of the following:—

(1) Grinding mill. (2) Mixing machine. (3) Hydraulic flag press with pumps and accumulators. (4) A good place for seasoning the flags after their manufacture.

The flags are produced by finely grinding the clinker in a mortar mill with perforated bottom, mixing it with Portland cement in the proportion of 75 parts clinker to 25 parts Portland cement, and pressing by hydraulic pressure to about 60 tons per square foot of surface. In this process the superfluous water is squeezed out and a solid flag is produced which will bear a certain amount of handling, and soon sets very hard. A finer surface is sometimes obtained by adding a small proportion of granite chippings. (W. D., *Dudley.*)

An Opportunity for Assistants and Town-Planning Experience.—A SURVEYOR reader—an Assoc.M.Inst.C.E. who has in hand schemes which will involve a knowledge of the use of the tacheometer and percentage unit theodolite, will shortly be able to give employment for three months to two "good third-year municipal engineer's pupils." They would be paid "according to their worth." The same correspondent prefaces with the comment that he has "strong views that town-planning is a municipal engineer's job," an intimation that if there be "a man wanting a holiday send him here and I'll put him up and give him something interesting." If those to whom either of these opportunities appeals will communicate with us we shall be pleased to forward their letters to our correspondent. All such communications should be addressed to the editor of the SURVEYOR, and their envelopes should be marked "Appointment."

A Tricycle Street Sweeper.—Jacquelin, a French champion cyclist, has just secured a patent for a tricycle to be used in street cleaning. A cylindrical brush is fastened by gas pipes to the tricycle. In front of it and between the two rear wheels is a basket or scoop for the sweepings. Above the brush a guard is fastened which prevents the sweepings from dropping out of the basket. When nearing a heap of dirt, Jacquelin backs his tricycle, the brush revolves, picks up the matter and throws it into the receptacle. This is, however, only necessary when considerable quantities of dirt have to be collected; if it is simply intended to sweep the street, this is done while the rider rides the tricycle in the ordinary way, the brush turning and gathering the dust into the basket. The machine does the street sweeping more quickly and thoroughly than a number of men can accomplish it.—From *Scientific American.*

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries which should be written legibly on foolscap paper, one side only, should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—*i.e.*, without re-drawing or amendment.** ***Unless these conditions are complied with we cannot undertake to reply to queries.***

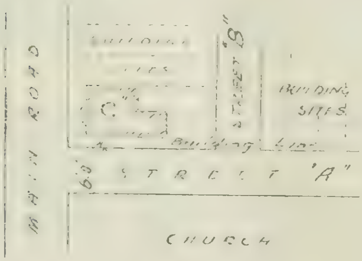
QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

STREET OBSTRUCTIONS.—"Vertex" writes: An occupier of a building in a street 30 ft. wide, in which there are footpaths 5 ft. wide on each side, has erected in front of the house occupied by him a fence about 2 ft. high for a distance of about 20 ft. The fence is erected at right angles to his house. It is, of course, dangerous to passengers, who have to turn off the footpath and walk in the roadway in consequence. The street is a private one and a *cul-de-sac*. In the same street at the top and the end another owner, who is also occupier, erected a privet hedge, also in the footpath, about ten years ago. This was never the subject of any inquiry by the district council, being allowed to remain. Now that the first case mentioned has been reported the occupier demurs to remove his fence unless the first offender, as he alleges, is also to receive notice from the district council to remove the privet hedge. What I wish to ask is this: Is it not quite in order to serve notices under sec. 69 of the Towns Improvement Clauses Acts, 1847, and will it apply to both occupiers as well, notwithstanding, in the second case, it has been allowed to remain the length of time stated without any notice from the authority?

This would appear to be so. The section does not specify any limit of time within which the notice must be given.

PUBLIC HEALTH (BUILDINGS IN STREETS) ACT, 1888.—"J." writes: May I suggest that your answer to "Quest" in THE SURVEYOR of May 31st (p. 802) needs reconsideration? The Public Health (Buildings in Streets) Act, 1888, prohibits the erection or bringing forward of a building "beyond the *front main wall* of the house or building on either side of the same." In



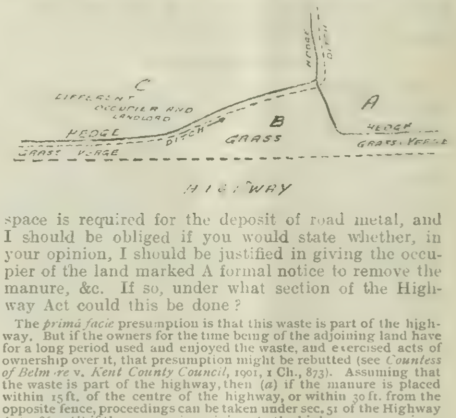
the case put to you the "front main wall" of C is clearly in main road; the building line of premises in street A is therefore not affected by the house C at all. If houses had been built in street A and main road before the erection of C, then, for the purpose of fixing its building line, C would be in both streets, and could be required to be kept within the building lines of both main road and street A.

I am much obliged to "J." for his communication. I quite agree that unless the front main wall of house C is in street A the building line of premises in that street is not affected by the house, and I regret that I overlooked this in my reply to "Quest." Certainly from the plan the front main wall appears to be in the main road.

WATER SUPPLY.—"A. T." writes: I recently submitted plans to a rural district council for the erection of a cottage on the site of an existing one, which is constructed of timber and tiles, whereas the proposed one would be of brick, slate and in every way in accordance with the by-laws of the district. I have received notice that the application and plans in question are disapproved, as the council do not consider that there is provided within a reasonable distance of the house a supply of water available for domestic purposes. For a considerable number of years, and at the present time, the water is carted or carried to the cottage. I should be glad to know whether you can, through your paper, state a case or give any information on the matter.

In my opinion the council are not justified in disapproving the plans on the ground stated. If the plans comply in all respects with the by-laws, the owner can either proceed with the erection of the building or apply to the Court for a *mandamus* to compel the council to approve the plans (Lumley's "Public Health Acts," 7th Edition, p. 358). But the house must not be *occupied* until a certificate has been obtained from the council, under sec. 6 of the Public Health (Water) Act, 1878, that there is provided within a reasonable distance such an available supply of wholesome water as may appear to the council, on the report of their inspector of nuisances or of their medical officer of health, to be sufficient for the consumption and use for domestic purposes of the inmates of the house. The Local Goverment Board have expressed the opinion that in deciding what is a "reasonable distance" regard must be had to the labour involved in carrying by hand a sufficient amount of water for the purpose of an ordinary household, and to the injurious results, as regards cleanliness and health, which are likely to arise if, in order to avoid this labour, the water used is stinted, or impure water more easily obtained is substituted for that which is purer but more distant (*Ibid.*, p. [illegible]).

ROADSIDE WASTE.—"L. C." writes: I should be glad of your opinion on the following: The occupier of the land marked A has recently deposited a considerable amount of manure and soil upon what, in my opinion, is roadside waste. The waste referred to is marked B, and has always been open to the public. The



space is required for the deposit of road metal, and I should be obliged if you would state whether, in your opinion, I should be justified in giving the occupier of the land marked A formal notice to remove the manure, &c. If so, under what section of the Highway Act could this be done?

The *primâ facie* presumption is that this waste is part of the highway. But if the owners for the time being of the adjoining land have for a long period used and enjoyed the waste, and exercised acts of ownership over it, that presumption might be rebutted (see *Countess of Belmore* v. *Kent County Council*, 1901, 1 Ch., 873). Assuming that the waste is part of the highway, then (*a*) if the manure is placed within 15 ft. of the centre of the highway, or within 30 ft. from the opposite fence, proceedings can be taken under sec. 51 of the Highway Act, 1864; (*b*) if the manure is an injury to the highway or an injury, interruption or personal danger to any person travelling thereon, proceedings can be taken under sec. 72 of the Highway Act, 1835; (*c*) if the manure is a nuisance proceedings can be taken under sec. 73 of the same Act.

SURFACE-WATER SEWER: POWERS OF LOCAL AUTHORITY.—"Treblaw" writes: A surface-water sewer along a main road empties itself into a ditch which runs along a field into a pool. Formerly by some unknown means the water found an outlet from the pool and thus got away, but of late this outlet has been, accidentally or otherwise, stopped up, with the result that the pool and ditch are troublesome to the owner of the field. As it seems impossible to discover how the water has been getting away, it is thought advisable to connect this small pool to a larger one which is short of water, and lies at a lower level some distance away. (1) Have the council any right to take the sewer across the field? (2) Have the council any right to drain into the larger pool? (3) What is the correct procedure? The pool and proposed sewer are just outside of the boundary of the district.

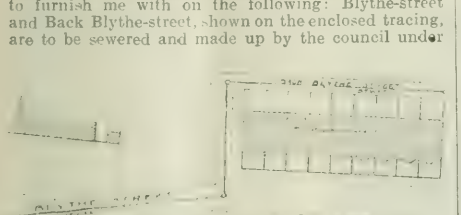
(1) In my opinion the council have no such right. The existing sewer being one for surface water only, it would appear that the last clause of sec. 16 of the Public Health Act, 1875, does not apply, inasmuch as the proposed sewer would not be used "for the purpose of outfall or distribution of sewage." (2) No, I think not. The implied power given by sec. 17 to convey purified sewage, or water free from noxious matter, into a stream or pool [illegible], 1897, 2 Ch. 29), must, I think, be exercised within the council's own district. See [illegible] v. [illegible] Freehold Land Society, 1906, 1 K.B., 21. (3) There does not appear to be any method by which the proposed arrangement can be carried out.

HOUSING AND TOWN PLANNING, &c., ACT, 1909.—"W. D." writes: My council have decided on the pre-

paration of a town planning scheme with respect to a part of their district, and in accordance with their instructions I have prepared the necessary plans details, notices, &c. Before proceeding any further in the matter, I shall be glad if you will inform me which of the following two courses is the right one to adopt—viz.: (*a*) To serve the necessary notices in accordance with the Act and Local Government Board Regulations, and subsequently confer with the owners of the land concerned, and other persons affected by the proposed scheme; or (*b*) to hold conferences with the owners and other persons concerned as to the council's proposals before serving the notices on them?

According to my reading of the Town Planning Procedure Regulations (England and Wales), 1910, issued by the Local Government Board under the Housing, &c., Act, 1909, it would appear that the right course is first to serve notices on owners, lessees, and occupiers (as provided by Article 1 of those Regulations), and then to consider any objections made by owners, &c., and endeavour by conferences to secure their co-operation (as provided by Article 3).

Private Street Works: Sewer.—"H. F." writes: I should be glad of any information you may be able to furnish me with on the following: Blythe-street and Back Blythe-street, shown on the enclosed tracing, are to be sewered and made up by the council under



sec. 150 of the Public Health Act, 1875. Mr. A has a frontage on Blythe-street and one on Back Blythe-street. The sewer only passes Mr. A's frontage on Back Blythe-street. Is Mr. A liable to be apportioned for the portion of sewering in Blythe-street, in addition to his apportionment of the sewer in Back Blythe-street?

No, unless he is the owner of any premises abutting on that portion of Blythe-street along which the sewer passes.

Breaking Up Streets: Restoration.—"Magna" writes: In our urban district the water and gas companies, sometimes after the usual notice, but often without giving preliminary notice, open up the roadways for connections, and when filling in leave the road in an unsound condition. My council have asked who is liable should an accident happen to someone lawfully using the road before the roadway is restored to a proper condition. The gas company have made an arrangement with the council for them to repair at a fixed rate per lineal yard, but even then there is an interval between their advising us and our getting to the work. The water company do their own work of repair.

Gas and water companies who break up streets are under a statutory obligation to reinstate the streets with all convenient speed and keep them in repair for three months, failing which they are liable to continuing penalties. (See the Gasworks Clauses Act, 1847, secs. 10 and 11, and the Waterworks Clauses Act 1847, secs. 32 and 33.) If an accident occurred in consequence of a company failing to carry out this obligation, or carrying it out negligently or defectively, they would, in my opinion, be liable. (See *Stanbury* v. *Exeter Gas Co.*, 1905, 2 K.B., 838; *Longbottom, Limited*, 60 J.P., 585.) I think it is doubtful whether a company could avoid liability by delegating their statutory duties to the council. The council would not, in my opinion, be liable except in a case where, having undertaken the reinstatement, they or their workmen were guilty of negligence in the execution of the work, and such negligence was the cause of the accident.

National Insurance Act, 1911: Unemployment.—"Kloffus" writes: The staff of workmen employed by a council includes engine drivers, stokers, steam-roller driver, horsemen, general labourers and scavengers. Of these, stokers, horsemen and scavengers are doubtless exempt from the unemployment insurance under Part II. of the National Insurance Act of 1911. Are the following also exempt: (*a*) An engine driver who does his own running repairs, and (*b*) a labourer whose work covers excavation for gas and water mains, sewers, &c., road repairs, construction of footpaths, and similar work?

The insured trades for the purposes of Part II. of the Act relating to unemployment are seven in number, as set out in the 4th Schedule—viz., building, construction of works, shipbuilding, mechanical engineering, iron-founding, construction of vehicles, and sawmilling. The schedule does not define either "mechanical engineering" or "iron-founding," but it would appear that the repair of engines might possibly fall under one or the other if not both, of these heads. "Construction of works" is defined as the construction, reconstruction or alteration of railroads and other specified works "or other works of construction," and I think this definition is probably sufficiently wide to include the works specified in the query, clause (*b*). Of course, this is a brand new Act, and it is impossible to say what decisions may await us in the future on the many knotty points that will doubtless come up in connection with it.

Housing and Town Planning Act, 1909.—"Frome" writes: I should esteem it a favour if you would advise on the following interesting legal point that has arisen in my district: A notice was served on the owner of certain cottages, under the Housing and Town Planning Act, secs. 14-17, to do certain repairs that were very necessary. A solicitor has replied that "these sections only apply to houses the tenants of which have only gone into occupation since December 3, 1909." Looking at the first words of sec. 14—"in any contract made after the passing of this Act"—it looks almost as if his contention were correct, but it makes the Act practically worthless if it is so.

Sections 14 and 15 apply only to contracts made after December 3, 1909. It is not strictly accurate, however, to say that they apply only to houses the tenants of which have gone into occupation since that date. On the one hand a tenant who had previously gone into occupation might have entered into a new agreement after that date, in which case the sections would apply. And on the other hand a prospective tenant might have entered into an agreement before, but not gone into occupation until after that date, in which case the sections would not apply. Sections 16 and 17 apply irrespective of any contract.

Paving of Yards.—"A. M. O. K." writes: In this urban district there are several unpaved courtyards common to a number of cottages. (1) Can the council compel the various owners to pave a certain portion of such courtyards, there being no by-laws in force respecting them? (2) A large number of self-contained cottages are also without any yard paving. My contention is that paving is a necessity in each case; but I am informed it is not compulsory without I can prove the absence of paving to be a nuisance, injurious to health. Your kind reply in The Surveyor will greatly oblige.

By-laws can be made under sec. 90 of the Public Health Act, 1875, for the paving of courts or courtyards of houses let in lodgings or occupied by more than one family. And in districts where Part III. of the Public Health Acts Amendment Act, 1890, has been adopted by-laws can be made under sec. 23 of that Act with respect to the paving of yards and open spaces in connection with dwelling-houses. In the absence of any by-laws there does not appear to be any power to enforce the paving of courtyards, whether used in common or otherwise.

Housing and Town Planning Act, 1909, Sec. 17, Sub-sec. (4).—"W. B. D." writes: An order by a court of summary jurisdiction was, on my application, made on certain persons to quit a dwelling-house within fourteen days. How is the order to be enforced? I shall be glad of a reply by post as well as in your valuable paper.

By virtue of sec. 75 and Schedule VI. of this Act, sec. 10 of the Housing of the Working Classes Act, 1903, would appear to apply where default has been made in obeying a closing order under the Act of 1909, that is to say possession of the house may be obtained under secs. 138 to 145 of the County Courts Act, 1888, or under the Small Tenements Recovery Act, 1838. Under the County Courts Act a summons is issued in the County Court, and on judgment being obtained the bailiff evicts the tenants and gives possession. Under the Small Tenements Act a magistrate's warrant is applied for (after notice to the tenants of intention to make the application), and on the warrant being granted the eviction is carried out by the constables. There appears to be nothing in the Act of 1909 providing for any other mode of enforcing a magistrate's order under sec. 17, subsec. (4).

Injury to Gas and Water Mains.—"Acrtex" writes: What liability attaches to a local authority with reference to the breaking of either water or gas mains by the steam roller? If a main is very small, or is placed very near the surface, will it relieve the authority from any liability as to damages?

If the pipes are sufficiently below the surface not to be injured by the repair of the road without the use of a steam roller, the local authority will be liable for any injury to the pipes resulting from the use of the roller (*Goodson and Cole Company* v. *St. Mary Abbots Kensington*, 1 Q.B.D., 1).

Private Street Works Act, 1892: "Owner."—"Trunot" writes: I should be much obliged if you would give me your opinion as to who is the owner under the above Act where a piece of land is leased for 99 years, the lessee or the lessor?

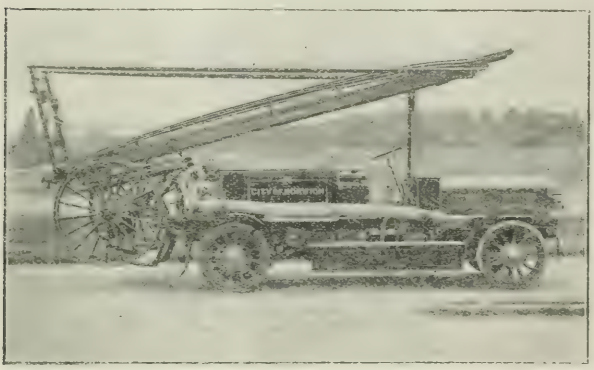
The term "owner" has the same meaning in this Act as in the Public Health Act, 1875—viz., the person for the time receiving the rack-rent, whether on his own account or as agent or trustee for any other person, or who would receive it if the premises were let at a rack-rent. If, therefore, the rent reserved by the 99 years' lease is a rack-rent, the lessor is the owner for the purposes of the Act, otherwise the lessee is the owner.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

MOTOR FIRE ENGINE FOR NORWICH.

The accompanying illustration shows a powerful new motor fire engine which has just been added to the equipment of the Norwich Fire Brigade. It is of the Merryweather petrol "Hatfield" design, with reciprocating pump capable of delivering 500 gallons per minute and upwards. It also carries a detachable fire escape to reach 50 ft., as well as 2,000 ft. of hose, and affords accommodation for a dozen firemen. The "Hatfield" type was chosen by the city engineer, Mr. A. E. Collins, M.INST.C.E., after he had fully investigated the merits of several other kinds of motor pumps.

Among the many advantages that an engine of this kind possesses over the ordinary horsed steam fire engine is that it enables the site of a fire to be reached with greater promptitude, and can be brought into action almost immediately. The greater alacrity with which the one could be used as compared with the other was demonstrated at tests which recently took place at Norwich. Although simultaneous preparations were made for starting the steam engine and the motor engine, the latter was in full action several minutes ahead of the former. The suction pipe of the motor had simply to be dropped into the water for pumping operations to be immediately begun.



"Hatfield" Motor Fire Engine at Norwich.

London County Council Chief Engineership.—Applications are to be invited by advertisement for the position of chief engineer to the London County Council, which will shortly become vacant by the resignation of Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E. The salary offered is £2 000 a year.

The Proposed Western Approach Road.—The Highways Committee of the Middlesex County Council reported recently that they had had an interview with the Improvements Sub-Committee of the London County Council. The chairman of the London County Council Improvements Committee, Mr. W. Whitaker-Thompson, stated that his committee were desirous of ascertaining the views of the Middlesex County Council as regards the proposed new western approach road suggested by the Road Board, and particularly whether the Middlesex County Council had decided that they were in favour of the actual route proposed by the board. Mr. County Alderman Pinkham stated that the Middlesex County Council, with regard to the question of a new western approach road, felt that [illegible] approval of the advisability, on general grounds, of the construction of a western approach road to London through Middlesex, provided satisfactory terms and arrangements could be made; that the scheme for the construction of such a road should be one between the London and Middlesex County Councils and the Road Board in the first instance; that in view of the fact that a road of this character [illegible] Road Board should be asked [illegible] a [illegible] a portion of the cost [illegible] that a general scheme for [illegible] could not be entertained. After some discussion the chairman of the London County Council Improvements Committee stated that the resolutions adopted by the Middlesex County Council would receive consideration.

ENGLISH GARDEN CITY AND HOUSING SCHEMES

GERMAN COUNCILLORS' VISIT.

The Garden Cities and Town Planning Association, of 3 Gray's Inn-place, W.C., are arranging for another visit of members of German municipalities to inspect English garden city and housing schemes, under the guidance of Mr. Culpin, the secretary.

The party, which will number about 100, will arrive in England on August 18th, and the next fortnight will be spent in visits to practically every housing scheme of importance in the country.

Among other places which will be seen are the Garden Villages of Hull, Earswick, Port Sunlight, Bournville and Knebworth, the Garden Suburbs of Wavertree (Liverpool), Harborne (Birmingham), Hampstead, Ealing, Ilford, &c., while special interest will be taken in the Garden City at Letchworth, where more nearly than any other place in this country the question has been solved of the provision of labourers' dwellings at an economical rate.

Municipal housing will be studied in the various towns visited, and the estates of the London County Council will be visited.

Among the party will be some of the prominent town planners and architects of Germany and Austria, while the town of Riga will send a number of officers to investigate.

The visit affords an excellent opportunity for town planners in England to rub shoulders with those who have actually done such work in Germany, and any students and others who would like to join the party at any point, or to meet at their social gatherings, are invited to communicate with Mr. Culpin at the above address.

Fifeshire Roads.—In his annual report and estimates for the present year, Mr. A. Forbes, county road surveyor, Dunfermline District Committee, says his estimates are based on the actual requirements for keeping and maintaining the roads in proper order. The quantity required is less than last year, but it is his intention to spend a little more on certain roads in the way of preserving existing good surfaces and minimising dust and wear. An allowance has been made for the purchase of bituminous tar for that purpose, and Mr. Forbes has also provided for the purchase from the Municipal Appliances Company of two tar boilers of 320 gallons capacity, with spraying attachments.

Road Construction and Maintenance in Perthshire.—Mr. W. L. Gibson, county surveyor of the Western District of Perthshire, in submitting his estimates for the year, remarks that the pitch grouting system under the Road Board scheme for 1911, while showing that it withstands all kinds of traffic, including heavy traction engines, gives a longer life to the metal bed compared with the water-bound system—which in his opinion is now an obsolete one on roads subjected to fast-moving traffic. Apart from the durability of the tar system, it gives off comparatively little dust, is easily cleansed, and is not affected by atmospherical changes, and Mr. Gibson notes with pleasure that he has not had one single complaint about its slipperiness during frosty weather. He emphasises the fact that often following a frost many horses are allowed to go on the road with frost studs or nails still in their shoes, doing damage to the surface by picking out the stones and leaving cavities for water to settle in, on pitch-grouted and water-bound surfaces alike, and expresses the view that if surfaces are to be made and maintained at the high state of efficiency which necessity demands, legislation will require to be introduced to obviate this evil. Mr. Gibson has included a sum of £135 in his estimate for tar-spraying lengths of road which were tar-grouted two to four years ago. He thinks it is necessary that tar-treated portions should be painted at least every second year; by doing so, he points out, it puts a fresh film or armour on the stone, thereby making the road more waterproof and extending its durability, and at the same time mitigating the dust nuisance.

Association of Managers of Sewage Disposal Works.

ANNUAL SUMMER MEETING AT WOLVERHAMPTON.

The annual general summer meeting of the above-named association took place on Saturday at Wolverhampton, and was well attended by members. After the meeting of the council, which was held in one of the committee-rooms of the Town Hall, the members were received in the council chamber by Alderman Berrington, in the unavoidable absence of the Mayor of Wolverhampton (Councillor T. W. Dickinson, J.P.). Those present included Colonel A. S. Jones, V.C., M.INST.C.E., Messrs. John D. Watson, M.INST.C.E. (President), A. B. Ogden, M.R.S.I. (chairman of the council), Alfred S. Sikes (Finchampstead, Berks), Gilbert J. Fowler (Manchester), H. W. Stafford (Dukinfield), E. Stamp (Ashton-under-Lyne), H. D. Bell (Stratford-on-Avon), D. Bradbury (Brownhills), C. Allsop (Brownhills), H. C. Cooper (Brownhills), W. J. Ashley (Oldbury), W. Tomlinson (Chesterfield), A. Stone (Nottingham), J. H. Edmonson (Manchester), J. B. Ogden (Manchester), Jas. Edmondson (Moss Side, Manchester), B. Otter (Leicester), T. Chettle (Reading), P. Gaunt (Macclesfield), E. Ardern (Manchester), W. H. Duckworth (Salford), R. Eaton (Southport), Joseph Sheard (Failsworth), H. Edwards (Gorton, Manchester), W. E. Speight (Bolton), R. J. Andrews (Stockport), J. H. Abbott (Chiswick), M. Dinsdale (Bedford), F. R. O'Shaughnessy (Birmingham), J. Clifford (Nuneaton), J. Shepherd (Foleshill), A. V. Reynolds (Longton), R. Giles (Burton-on-Trent), W. Tomlinson (Chesterfield), J. Ashton (late of Bolton), F. Hambleton (Newcastle, Staffs), G. G. Andrew (Walsall), J. Smith Westerley (Liverpool), Jas. Barron (Warwick), W. H. Makepeace (Stoke-on-Trent), H. A. Hines (Codestanton), J. Cookson (Yarmouth, near Bolton), E. Lewis (Yarmouth, near Bolton), and Chas. H. Ball (hon. secretary).

AN OFFICIAL WELCOME.

ALDERMAN BERRINGTON, in the name of the Mayor and Corporation, extended a hearty welcome to the visitors, and said the Mayor would have been delighted to be present, but they were aware that he led a busy life, and Saturday was an extremely busy day with him. The Mayor asked him to state that he trusted the visit of the association would be interesting and instructive to the members, and to add that he would meet them later in the day. Alderman Berrington proceeded to say that he was delighted to be present himself, and especially to welcome as their president his dear friend Mr. John D. Watson. They were also glad to see Colonel Jones with them. It was upwards of 35 years since he first met Colonel Jones in connection with sewage disposal at Leigh. He had met him on many occasions since then, and he ventured to think they were largely indebted to that gentleman for the interest he had always taken in the subject of sewage disposal. Wolverhampton, as they knew, was a smoky town in the Black Country, but when they got out to Tattenhall they would see a very beautiful country, and if they could only spend a day or two with them they would find they had something worth seeing, such as the art gallery and other institutions. With their sewage manager, Mr. W. Clifford, the Corporation were more than satisfied; if they were dissatisfied with him at all it was that he continued to be an old bachelor. (Laughter.) He was glad to hear of the progress of their association, and he trusted they had still more prosperous times before them. Those who gave service at sewage works were not, or had not been up to now, so well appreciated as they deserved, especially considering the important part they played in protecting the public health of the nation. The works they attended to were generally placed in the outskirts of the town, and they led a quiet, country life, doing some shooting, and that kind of thing—(laughter)—and did not come so much to the front as the people of the town. As regarded the reduction of the death-rate they scarcely ever heard of the important part played by the managers of sewage works. He only hoped they would continue to give their services to the community, and that the prosperity of their association would continue to increase.

The PRESIDENT observed that nothing he could say could possibly exaggerate the appreciation they had of the very hearty welcome they had received from Alderman Berrington on behalf of the Mayor and Corporation of Wolverhampton. It was satisfactory to know that Alderman Berrington appreciated the object of their visit. They as managers of sewage works were not banded together for any selfish purpose, but for the purpose of mutual improvement. They found considerable benefit in meeting together as they had on the present occasion. They learned a great deal from such meetings, and they were sometimes able to impart a hint to those whom they met that might be of some use in the particular town in which they happened to assemble. In this way, the benefits conferred by the association might be described as mutual, and they trusted that such meetings would continue to be advantageous to all concerned. He need scarcely say that they were conscious of their own ignorance, and that some of them felt less inclined to give advice on matters of sewage disposal to-day than was the case ten or fifteen years ago. Not that they knew less; but whether they knew less or more they were reluctant to venture to give advice. They had met for the purpose of visiting the Wolverhampton sewage works, of which they had heard so much. He had no doubt they were works which were well worthy of a visit, and of their closest attention, and it was to be hoped they would prove of the greatest possible benefit to Wolverhampton. They hoped by such visits to glean information, exchange ideas, and to profit by mutual intercourse. He had not the least doubt that when they saw the works they would feel that the corporation had done wisely in entrusting themselves to Mr. G. Green, the borough engineer, and to Mr. W. Clifford, manager of the sewage works; he had no doubt also they would be able to observe many things that would appeal to them, and which had been carried out by the advice Mr. Green had given as engineer, while the works had been in progress.

The meeting then proceeded to the consideration of the papers prepared for the occasion, one of these being:

PREVENTION OF AERIAL NUISANCE FROM SEWAGE CONTAINING BREWERY WASTE. DEODORISATION METHODS IN USE AT STRATFORD-UPON-AVON.

By HERBERT D. BELL,
Manager and Chemist.

Sewage disposal works have for many years had a somewhat evil reputation, in some cases justifiable and in others due to prejudice, owing to the odours emitted during the processes of purification from time to time. In some instances the methods of treatment have increased the smell from a sewage, which otherwise might have been dealt with without cause for complaint, whereas other types of sewage have puzzled the brains of experts to devise a process whereby the aerial nuisance, as it is now called, can be prevented.

The works which I have the honour to control at Stratford-upon-Avon deal with a sewage whose peculiarities are perhaps unique. Some of the main sewers in the town are old, have bad gradients, are leaky, and in some cases the roots of lime trees penetrate right through the walls. During the winter months when the river becomes swollen owing to heavy rains, the subsoil becomes saturated, and water percolates into the sewers. This increase to the daily flow continues for several weeks after the river has subsided. During the summer months this increase does not take place, and, consequently, in the hot, dry weather the sewage is in its strongest state. The constituents of the sewage include brewery waste from one large brewery and two or three very small ones, fellmonger's waste, liquors from a suction gas plant and gasworks, butcher's offal, together with a strong domestic sewage. As Stratford-upon-Avon is an agricultural centre there is also a certain amount of liquor from cattle pens.

The water supply from the waterworks averages about 11·0 gallons per head of population, the average daily dry weather flow from April 1st to November 28th, and from November 29th to March 31st, being made up to 26·1 and 44·6 gallons respectively per head by wells, canal, and infiltration water. During the summer months there is a considerable increase in the population due to visitors, which reduces the former volume to approximately 20 gallons per head.

The sewage is delivered to the disposal works by

pumping, the total lift being 100 feet, and the length of the rising main is some 2,200 yards. With one pumping operation at the present rate the time taken for the passage of the sewage up to the works from the pumping station is about 3½ hours. Each of the pumps, three in number, was designed to deal with the whole daily dry weather flow in 12 hours, which of course makes it impossible to keep a steady flow through the tanks all day. The revolutions per minute of the pumps have been reduced in order to extend the period for pumping the dry weather flow to 18 to 20 hours, but even this does not tend to make the conditions ideal. The stoppage of tank treatment and the quiescent state of the sewage in the rising main owing to the cessation of pumping until sufficient sewage arrives at the pumping station helps to produce objectionable odours by rendering the sewage more or less septic before its arrival at the works. If the number of revolutions were further reduced it is questionable whether the diminished velocity would not have the same effect in converting this particular class of sewage into a septic state. The volume of the brewery waste present is more than 10 per cent. of the average daily dry weather flow, and therefore in a sewage of this kind, hot dry weather rapidly renders the whole sewage into a very "active" state; consequently the more rapidly the daily flow of sewage can be passed through its process of purification, the more likely will be the chance of success, in so far as aerial nuisance is concerned. The units for treatment on reaching the works are tanks, contact beds and circular percolating filters, and final passage through land for the average dry-weather flow.

The works were designed for open septic tank treatment, and were opened on November 1st, 1906, and the tank treatment was started on septic lines.

Open septic tank treatment without chemicals continued until November, 1908, when an addition of lime to the sewage was made for a ten weeks' experiment The results of this experiment justified a trial with lime during the year 1909-10. The addition of lime certainly reduced the volume of odour emitted, although I considered that if there was a long period of hot, dry weather there would be great difficulty in preventing a nuisance, owing to the over-septic state of the tank effluent. During 1910-11, closed septic tank treatment with sodium hypochlorite as a deodorant was compared with open septic tank treatment, the sewage entering the latter being treated with lime. The conclusion I drew from the tank treatment from November 1st, 1906, to March 31st, 1911, was that septic tank treatment, for a sewage containing the percentage of brewery waste present at Stratford-upon-Avon was unsuitable, because septic treatment had taken place in the town sewers and in the rising main to such an extent that the tank effluent showed unmistakable signs of being over-septic, being consequently just in the right condition for liberating hydrogen sulphide and other offensive odours. The addition of lime before septic tank treatment appeared to have a retarding influence on the sewage as it arrived at the pumping station, consequently there was a greater reduction of the organic portion of the sludge under those conditions than when the alkali was absent. But, it was extremely difficult to prevent the septic tank effluent from becoming over-septic after the tank had been in operation six or eight weeks, even with lime treatment, the addition of lime increasing in grains per gallon with every week that the tank was kept in operation.

EXPERIENCE OF SEPTIC TANK TREATMENT.

The experience of the results of septic tank treatment strongly supported a theory which I held a few weeks after my appointment, namely, that septic treatment was not the right method for sewage containing brewery waste, and in April, 1911, I commenced sedimentation tank treatment, continuing this until April 23rd, when I recommenced using lime, but this time with precipitation and not septic tank treatment. Tanks which previous to March 31st, 1911, had been in operation from three to six months, and which required three to four days to remove the sludge, now were in operation from six to ten days, the sludge being removed in less than seven hours.

Since April, 1911, chemical precipitation with lime added at the pumping station, and subsequent deodorisation, when necessary, with calcium hypochlorite solution obtained from chloride of lime or bleaching powder, has been in use. The addition of both lime and bleaching powder was carried out on an experimental basis, the milk of lime being added by manual labour, one gallon every five minutes during the day and every ten minutes during the night. Alternate tanks were in operation during the summer months, and one or more tanks in winter, the average period of operation in the colder weather being 20-28 days.

The sludge on removal from the tank was run into lagoons whose average depth is about five to six feet. Each lagoon has a system for drawing off the top water which settles out from the sludge, and after the removal of the sludge from the tank, the top water was drawn off after about one to two hours' settlement, the thicker sludge being covered with a mixture of peat stable litter and slaked lime. The addition of this mixture apparently absorbs hydrogen sulphide as the sludge digests, also the lime in the covering mixture has a further precipitating action on the sludge, which rapidly settles, more top liquor being produced and drawn off, leaving the sludge more dense, so that the surface rapidly dries and becomes inoffensive.

The sludge contents of the next tank to be emptied were run on to the top of the sludge in the lagoon, the covering operation repeated, and so on until the lagoon was full, at which time another drying bed was commenced. The average period of the drying of the sludge for removal by farmers, previous to March 31st, 1911, was from 10 to 15 months, whereas since chemical precipitation tank treatment has been in operation the drying period appears to be about four to eight months. The area of the lagoons, six in number, which deal with all the sludge, is approximately half an acre and the total capacity is about 3,760 cubic yards. There are three large lagoons, whose average length is 144 ft., 30 ft. wide, and 6 ft. deep, each of which are divided into three compartments. The three other lagoons are 132 ft. long, and the average width and depth are 12 ft. and 5 ft. respectively. At the present time (June, 1912) there are 1,600 cubic yards occupied by wet sludge, 1,227 cubic yards of sludge ready for removal, and 933 cubic yards of space ready for more wet sludge.

Each compartment of a large lagoon, approximately 320 cubic yards, takes from five to seven weeks' sludge from the tanks. The lagoons are simply earth banked, and, consequently, more can be made if required on another half-acre of land which is at liberty for the purpose. I am hoping that the lagoons at present in use will be sufficient for the volume of sludge even under precipitation tank treatment, as the increase in sludge for 1911-12 does not appear to be very much in comparison with that of 1910-11, and previous years, showing that septic tank treatment did not remove a very high percentage of the organic matter in the sludge.

DEODORISATION RESULTS.

I will now proceed with the results obtained by deodorisation. The method of addition of lime has been already described, and it was mixed in a trough containing two hours' supply, the weight of raw lime for each two hours varying with the time of day or night and the period of the year.

For the bleaching powder treatment, two wooden vats, each capable of holding approximately 1,100 gallons, were fixed on two platforms, so that the contents of one would discharge into the other. The one at the higher elevation was used as a storage tank for the town's water, which was used for preparing the solution. The vat at the lower level was divided into two compartments, so that, alternately, one portion could be used for preparing the deodorising solution whilst the other contained the prepared liquor, which was being distributed to the tank for deodorising purposes. The bleaching powder was mixed into a cream in buckets and then poured into the vat, and water run in, until the compartment was full, mixing being continued during the diluting operation, two to three hours being required for settlement. Each compartment of the vat was so constructed that the solution could be distributed for deodorising purposes, and also that the sediment could be drawn off when required.

The addition of the lime intermittently (every five or ten minutes) made it very difficult to prevent the fermentative action of the brewery waste from reforming its acid products. On several occasions during the long drought free alkali was absent in the tank effluent, although 37 grains per gallon of lime, as calcium oxide, had been added. This proved that if no alkali had been used the sewage would have been strongly acid before reaching the works, and under septic tank conditions the consequent evolution of hydrogen sulphide would have

required an almost prohibitive addition (as far as costs are concerned) of bleaching powder, or other oxidising agent, to prevent aerial nuisance arising. When the tank effluent showed the presence of hydrogen sulphide bleaching powder solution was run in, the volume being adjusted so that this gas would be oxidised and thereby prevent aerial nuisance arising. This deodorising liquid, however, was not always to be obtained, owing to the shortage of town's water, and on one or two occasions a slight aerial nuisance was unpreventable.

Lime treatment was continued during the winter because (1) the sludge produced by lime was found to settle more rapidly in the lagoons; (2) the tank emptying operations were accompanied by less odour; (3) the resultant sludge dried more quickly; (4) the tank effluent produced was less impure, and (5) there was a greater percentage purification of the tank effluent by the circular filters than when the alkali was absent.

The total weight of lime used was 104 tons 16 cwt. Ninety-eight tons 16 cwt. were used at the pumping station for treating the sewage, and 6 tons were used with peat stable litter for covering the sludge in the drying trenches. The lime added to the sewage was equivalent to 11·8 grains per gallon calcium oxide from April 22nd, 1911, to March 30th, 1912, at which date lime treatment was suspended, because lime could not be obtained owing to the coal strike. The volume of sewage treated was 119,828,340 gallons. The weight of bleaching powder purchased was 3 tons 17 cwt. 1 qr., and 15 cwt. remain in stock for the present year (1912-13). The equivalent weight of available chlorine obtained from the bleaching powder was 2,069 lb., or 29·6 per cent. The weights of available chlorine added were 1,006 lb. in rising main chamber, 793 lbs. to the tank effluent, and 270 lb. during sludging operations.

The rising main chamber is the chamber which contains the end of the rising main, and, consequently, is the first point which the sewage reaches after treatment with lime on its arrival at the works. The total volume dealt with was 31,879,440 gallons, and the weight of bleaching powder added was equivalent to ·395 grains per gallon of available chlorine.

The deodorising solution was added on 112 days, the total number of hours being equal to 75 days. The average weight per day (112 days) was 16·06 lb. available chlorine, and the average weight per hour (75 days) was ·99 lb. available chlorine.

The estimate which I laid before the General Purposes Committee in March, 1911, was 42 lb. of available chlorine per day for 63 days, which would have been 2,646 lb., whereas the total amount used including sludge disposal was only 2,069 lb.

In order to add the deodorising liquid to the tank effluent the Town Council decided to purchase the patent rights from Oxychlorides Ltd., but from the above it will be seen that the addition of a larger amount of available chlorine at the rising main chamber would have obviated the necessity of taking over the patent rights.

If septic tank treatment had been adopted there is no doubt whatever that the estimated amount of 2,646 lb. of available chlorine would have been very much exceeded, as under the conditions of last summer's hot weather, the sewage arriving at the works had already become septic on very many occasions. The mean temperature of the sewage from July 22nd to September 15th, 1911, was 67° F., the average daily dry weather flow for the sewage from April 1st to November 28th, 1911, was 223,204 gallons, 26 per cent below the average daily dry weather flow for the same period in the previous year, and the mean temperature for the air from July 22nd to September 15th was 72·7° F. All these conditions of high temperature, dry weather, very strong sewage—the last-named of a very fermentative nature—combined to make it almost impossible, under experimental control, to prevent aerial nuisance arising, but for all this, written information was obtained from residents in the neighbourhood that the change of treatment was an improvement on past years, taking into consideration also the very trying season, and no complaint has been received by the Sewage Disposal Committee since September, 1910.

It is a practical impossibility to make the treatment of this sewage absolutely inodorous, but I believe that the treatment will be even more successful next year, if all my recommendations are carried out.

The result of the deodorisation experimental treatment under the most trying conditions of last summer has met with the approval of the Sewage Disposal Committee, who have decided to adopt this scheme. A mechanical lime mixer has been purchased, and the building to enclose this, with storage and slaking pits, has been let out to contract and is nearing completion.

With regard to the bleaching powder treatment, I have recommended the use of circular filter effluent instead of town's water, because this liquid can be obtained at very little cost by pumping and in a much larger volume. A weaker solution of the deodorant can be used with better effect and thus save the use of town's water.

COSTS.

With regard to costs I do not propose to give the actual cost of lime treatment, as the latter will be useless for other work, because it was carried out entirely by manual labour—both the mixing and adding of the milk of lime. I will give the actual cost of all the lime used including haulage, both for the treatment of the sewage and the covering of the sludge, and also the costs of the whole treatment by bleaching powder including town's water, haulage and incidental expenses.

The cost of lime and haulage for the treatment of the sewage was £81 10s., or 13s. 7·2d. per million gallons dealt with, and for the covering of the sludge the cost was £5 5s., or ·44 pence per ton of wet sludge or nearly 2·96d. per ton of dry sludge. The cost of bleaching powder used from 1911-12 together with haulage to the works was £15 17s., equivalent to 1·84d. per lb. of available chlorine. The cost of labour (entirely manual) for preparing the solution, together with the town's water and incidental expenses, was equal to 1·13d. per lb. available chlorine, making a total cost for bleaching powder treatment equivalent to 2·973d. per lb. of available chlorine, or 16s. 1d. per million gallons deodorised.

CONCLUSIONS.

The conclusions drawn from the results of last year's treatment are (1) that the slight increase of sludge per million gallons is more than compensated for by the large reduction of aerial nuisance, by the substitution of lime treatment and precipitation tank methods, for septic tank treatment and any other form of subsequent deodorisation, and (2) that bleaching powder is the most economical form of oxidising agent which can be used as a deodorant. The success which this treatment met with last year, led to my being consulted in conjunction with Dr. Barwise, Medical Officer of Health for Derbyshire, by the Town Council of Tiverton. The brewery waste in the sewage of that town gave rise to odours similar to those which had been found at Stratford-upon-Avon, and we advised a similar scheme of deodorisation with lime and bleaching powder to the one adopted here last year. The scheme has met with approval of the Tiverton Town Council, who have decided to carry out the treatment on an experimental basis on the same lines as at Stratford-upon-Avon last year.

DISCUSSION OF PAPERS.

The PRESIDENT (Mr. J. D. Watson) congratulated the authors upon their papers, remarking that they gave food for thought, and—he was referring particularly to the paper by Dr. Fowler and Mr. Clifford—might have important results when the scientific tests were carried further.

Mr. W. H. MAKEPIECE observed that Dr. Fowler and Mr. Clifford had dealt excellently with a subject as to which they were to a great extent working in the dark. He would like to know whether when the experiments were carried out the various soils contained the same amount of moisture, and whether experiments had been conducted with respect to the porosity of the same soil under different conditions. With respect to Mr. Bell's paper, it seemed that there was an enormous difference in the rate of flow coming into the works. It was stated in the paper that 11 gallons was the waterworks supply, and that the average flow in the summer months was 36 gallons per head, and 44 in the winter. This perhaps would explain why in the summer the sewage became more septic.

Mr. F. R. O'SHAUGHNESSY recalled the evidence given by Alderman Mechi before the Royal Commission in 1838, with respect to the treatment of the soil, and said that that gentleman's plan was that of spraying the crops with sewage. He foretold that they would one day see the sewage of London distributed upon the soil by means of spray jets, but it appeared that the alderman was a long way ahead of his time.

Mr. E. ARDERN remarked that the closer and more thoroughly the investigations of Dr. Fowler were carried

out the greater would be the help given to those who had the management of sewage farms, and he considered they could not be too grateful to gentlemen who devoted their time and attention to the elucidation of natural phenomena.

Mr. J. H. Abbott said that the investigations of Dr. Fowler were extremely interesting, but the results were only tentative, as nothing like a final stage had yet been reached. The method pursued of forcing air was, of course, more or less arbitrary, but he thought that any one who had had experience of peat soil would appreciate the peculiarities with respect to it that had been pointed out in the paper. The method of Dr. Fowler, however, could hardly apply to a large area of land unless it was split up into small plots, because, as they knew, they found astonishing variations in particular tracts of land. It was not possible to get rid completely of the colloidal matter, as there would be always a layer on the surface when the process was carried out rapidly, whatever might be the nature of the subsoil. He considered that Mr. Bell was to be congratulated on the manner in which he had worked out the figures in his paper.

Colonel Jones remarked that the last time he saw the Wolverhampton farm he said the whole aspect had changed, a result due to the careful manner in which Mr. Clifford had dealt with the sewage. He thought Mr. Clifford had succeeded most admirably; in fact he (Colonel Jones) had come to the conclusion that the land was coming to the front once more. (Laughter.)

The President, alluding to a suggestion that Dr. Fowler's paper was largely scientific and speculative, said he was reminded of a speech once made by Mr. Arthur J. Balfour, who was asked, with reference to the recommendations of the Royal Commission on Sewage Disposal, whether he was in favour of indicating that there should be something in the nature of a central authority. He asked for information, and when it was put to him that a great deal of money might be saved by communities who were to an extent working in the dark, he replied: "That is exactly what the English people like to do. They don't want a cut-and-dried scheme; they don't want a Government department to lay down rules, but are much better pleased to spend their money, though it is misspent, in finding out for themselves what they would like to do."

Dr. Fowler, in reply to the discussion, said he desired to emphasise what he had stated at the beginning, that his object was only to arrive at some quantitative method of differentiating soils. They spoke vaguely at present, but whether it was good or not, at any rate they tried to measure what could be done. He trusted others would follow up and see whether the process of investigation could be carried out on a larger scale.

Mr. W. Clifford also replied, and stated with respect to the question as to moisture that this was shown in tables that would appear in the printed paper.

Mr. Herbert D. Bell said, as regarded the question with respect to the difference between the number of gallons per day from the waterworks and the number dealt with at the sewage works, that there were a large number of wells in use in the town of Stratford-on-Avon. The town water was not connected to all the houses, and the brewery used its own water supply. That made up the difference between the number of gallons of water and the number of gallons of sewage. The increase of the flow in winter was due to the higher level of the river.

An adjournment took place to the "Star and Garter" Hotel, where lunch was served and complimentary toasts proposed and acknowledged. The sewage works and farms were then visited, and finally the Sewage Works Committee entertained the visitors to tea.

A paper by Dr. G. J. Fowler, [illegible] and Mr. W. Clifford, Assoc.M.Inst.C.E., entitled "Notes on Methods of Differentiating Soils for Sewage Purification," will appear in a future issue.

Poisonous Street Dust. At an inquest held on Monday at Cardiff with respect to the death of William Bennett, Dr. Harris, medical officer of health, stated that Prof. Delepine, of Manchester, had made an investigation by the deceased's brother in which were the cause of the illness. Every article [illegible] and Dr. Harris gave it as his opinion that the [illegible] at the house [illegible] which it was obtained.

THE ROAD BOARD.

SEVENTH LIST OF GRANTS TO HIGHWAY AUTHORITIES.

During the months of April, May and June, 1912, the Road Board, with the approval of the Treasury, have made advances amounting to £123,315 from the Road Improvement Fund to county councils and other highway authorities, as follows:—

	£
For the improvement of road crusts (including grants towards tar-macadam, &c., and surface tarring)	105,186
For road widenings and improvement of curves and corners	13,258
For road diversions	2,523
For construction and improvement of bridges	2,347
For construction of new roads	*Nil.*

The total grants up to June 30, 1912, after deducting grants cancelled, are as follows:—

	£
For the improvement of road crusts	525,980
For road widenings and improvement of curves and corners	69,838
For road diversions	20,799
For construction and improvement of bridges	17,475
For construction of new roads	4,928

Advances by way of loan have also been made to the sum of £88,958.

In addition, further advances amounting in the aggregate to about £594,000 have been indicated to highway authorities towards works of improvement, of which the details are still under consideration and discussion.

The board have also intimated that they are prepared to contribute, subject to the approval of the Treasury, £875,000 towards the construction of a new western approach road to London

July 4, 1912.

Northwich Improvements. It has been decided by the Northwich Urban District Council to apply for sanction to borrow about £14,000 for sewage outfall works, public baths, private street works, sett-paving, and the erection of twenty-four houses for the working [illegible].

STOURBRIDGE AND DISTRICT WATER BOARD'S UNDERTAKING.

RECENT BORING OPERATIONS AT THE COALBOURNBROOK STATION.*

By WILLIAM FIDDIAN,
Consulting Engineer to the Board.

A little over two years ago the Stourbridge and District Water Board acquired by Parliamentary authority the undertaking of the Stourbridge Waterworks Company. The population served is about 40,000, and the present consumption of water about 1¼ million gallons per day. The supply is obtained from three pumping stations, known as Mill Meadow, Coalbournbrook, and The Tack, with wells and boreholes in the Bunter measures of the new red sandstone. These stations are in the valley of the river Stour, Mill Meadow being about three-quarters of a mile above Coalbournbrook, and The Tack a similar distance below. The waters obtained from Mill Meadow and Coalbournbrook have each 25 deg. of hardness, while that of The Tack has only 12 deg. This difference appears to be due to The Tack borings being in the lower sections of the Bunter sandstone, where they outcrop at the lip of the basin in which the water is impounded. Coalbournbrook pumping station is situated on the deepest portion of this basin.

In a recent report presented to the Board by the author it was recommended that, for purposes of economy in pumping and the securing of an improved supply, both as to quantity and softness, Coalbournbrook station should be adopted as the main source of future supply, that the existing 20-in. borehole should be deepened from 200 ft. as then to 400 ft. or more, and a new engine-house with high-duty pumping plant erected, also an additional reservoir for the low-level service (in more suitable position and at 40 ft. higher level than the present one) should be provided with the requisite pumping and distributing mains for the rearrangement of the high and low level areas. Great economies are expected from—(*a*) The concentration of the pumping at one station; (*b*) the use of high-duty pumping plant on all but extraordinary occasions; and (*c*) a better division of the two areas, which will reduce the supply required by the high level to about one half of that at present.

The works are now in progress.

The main purpose of this paper is to describe the work done in deepening the 20-in. boring at Coalbournbrook, and particularly the separation of the upper and harder water of this borehole from the softer water met with in its deepened portion.

It should be explained that the original supply was taken from a well about 50 ft. deep with a 7-in. borehole to a depth of 140 ft. from the surface. At this depth a large quantity of water was met with, and further boring was considered unnecessary. In later years, after the erection of additional pumping plant, the late waterworks company desired to increase the supply from this station, and it was then that the 20-in. borehole was put down at a point some 60 ft. distant from the well. At 138 ft. from the surface the boring operations caused a marked discoloration of the water in the well, and, as a supply from this source had to be kept up, could only be carried on intermittently; so that, presumably on this account and because of the increase of water already obtained, operations were stopped when a depth of 200 ft. was reached. From a knowledge of these and other facts, it became evident that a horizontal parting in the sandstone of considerable water-carrying capacity existed between the 20-in. borehole and the bottom of the 7-in. bore from the well, and that the bulk of the water supply was obtained from this parting.

When considering the problem of obtaining increased and improved supply of water for the undertaking on its acquirement by the board, the author found it practicable to make alterations at The Tack pumping station, by which Coalbournbrook station could be shut down during periods of ordinary consumption of water so as to allow of the 20-in. boring being continued without discoloration of the water supply.

Starting from the existing depth of 200 ft., the New England Boring Company, the contractors for the work, carried the 20-in. bore at its full diameter through the pebble beds, and about 85 ft. into the lower bed of the Bunter sandstone, making the total depth 500 ft. This work was done by the method described in a paper read at the Guildford meeting ("Proceedings," 1910-11, pp. 258, 259), and with considerable rapidity except when passing through layers of marl and loose pebbles, some 10 ft. of which were encountered at the base of the pebble beds. For marl or such-like strata the older percussion method of boring is undoubtedly the better, but in this instance the layers were thin and did not warrant a change of method. The loose pebbles gave considerable trouble, and had to be ground away by the revolving tool. A few pebbles came to the surface uninjured by the tool, but they must have fallen from the side of the borehole into the receptacle for *débris* on the top of the tool after it had passed below the bed of pebbles. It is very probable that a change to percussion methods would not have improved matters, as there would be a liability of disturbing and having to deal with a larger quantity of pebbles.

Tests were made at intervals during the boring operations (by means of the existing permanent pumping plant) to find as far as possible, the extent to which the supply of water had been increased, and samples were taken of the water obtained below 200 ft. from the surface during pumping to ascertain the character of the new water. By means of a comparison of the records of the levels of water in the well and the 20-in. borehole respectively before the boring commenced with those taken at the several stages of its progress, the conclusion was arrived at that a total quantity of above 2,500,000 gallons of water per day would be obtainable at this station.

The quantity of water coming from the lower portion only of the 20-in. borehole having been estimated to be more than the board's present requirements, and its hardness found to be 12 deg., or about one half that of the upper water, and its quality excellent, it was decided to attempt to make a controllable separation of the two waters. This was most successfully effected in the manner now to be described.

The 20-in. borehole as originally put down was lined with 20-in. steel tubes to a depth of 110 ft. This lining has now been extended some 45 ft. with 16-in. tubes. It was sealed at the bottom to the side of the borehole by being lowered into 6 ft. of liquid cement held up by a plug temporarily formed in the borehole. When the cement had set the portion projected inside the tube and a similar portion of the plug below were cut away. The joint at the connection of the 20-in. and 16-in. tubes was also made with liquid cement, a packing ring between the two tubes about 6 ft. from the top of the smaller tube preventing the cement grout passing down below it. By this means an annular space was left between the 16-in. tube and the rock side of the borehole from 110 ft. to 155 ft. from the surface, between which points (at 138 ft.) the before-mentioned parting gives communication with the well borehole. When this work was complete it was found that the object aimed at had been realised, as the lowering of the water level in the well 40 ft. only slightly affected the level of that in the 20-in. borehole.

The 20-in. borehole has been connected to the well by a 15-in. cast-iron pipe controlled by two sluices. The level of this connection is 35 ft. below the top of the borehole, and the standing water level is 2 ft. below the top. To make the connection a shaft was sunk between the borehole and the well (some 10 ft. from the former), and a heading driven in the sandstone rock in both directions. The method of attaching the 15-in. branch to the 20-in. bore tube while under a head of 33 ft. of water was that used for water mains by Messrs. J. Ruscoe & Co., of Manchester, from whom the necessary cutting tool was hired. The suction pipes of the pumping plant to be erected will be taken down this shaft and connected to the 15-in. horizontal pipe between the two sluices before mentioned. By this arrangement water can be obtained from the 20-in. borehole only, from the well only, or from a combination of both sources of supply in such proportions as may be desired.

Upon the connection of the 20-in. borehole to the well by a pipe it became possible to make a direct pumping test of the yield of the former. This proved to be practically what it was estimated at before the upper and lower waters were separated, namely, over 1,500,000 gallons per day.

The new plant will consist of a triple expansion rotative steam engine with vertical and inverted cylinders and direct single acting ram pumps, capable of pumping 1,500,000 gallons per day with a lift of about 300 ft. This will be used for low level requirements. For high level service it is intended later on to remove and instal here the high-duty Worthington engine at present at Mill Meadow station, the capacity

* Paper read at the meeting of the Institution of Municipal and County Engineers at Stourbridge last Saturday.

of which is 500,000 gallons per day against a head of about 450 ft.

When the whole of the new works are complete, the demand for the low level area is expected to be about 1,000,000 gallons per day, and for the high level area about 300,000 gallons per day.

The advantage of having all the pumping at Coalbournbrook instead of being spread over three stations is unquestionable. The plants at Mill Meadow and The Tack and the existing pumping engines at Coalbournbrook will in future be maintained for ordinary stand-by purposes, and for use in case of exceptional demand for water.

MUNICIPAL WORK IN CANADA.

(From a Surveyor *Canadian Correspondent.)*

The question of furnishing quantities in connection with building has been vigorously discussed in one of the technical journals. The merits and demerits of the Canadian plan as opposed to the British system have been exclusively debated, one of the biggest contractors in Canada, Mr. C. E. Deakin, of Montreal, championing Canadian practice. Under this every contractor tendering on a job takes off his own quantities, and the arguments in favour of this are that the work involved is not worth considering, that each man should be responsible for his own work, and that it is unsafe to take quantities from outsiders, no matter how accurate they may be. Mr. Deakin states that in cases where he has tendered on jobs where the quantities have been furnished he has been asked to pay from 2 to 2½ per cent on the amount of the contract for the quantities, and in no case has he found a quantity surveyor who was willing to be responsible for any mistakes he might make by omitting any quantities of material.

The British plan found considerable support, instances being given of the practice in tendering for municipal work. The chief ground in favour of Old Country practice is that it saves duplication of the work, is done by trained men, and that it effects an all-round saving. The chance of errors is met by a special clause, and Mr. S. H. Penlington, A.R.I.B.A, of Toronto, declares that the difference between the two systems is that between a guessing competition in a contractor's office at midnight and the steady work of a quantity surveyor. The furnishing of quantities upon a business-like basis practically eliminates the element of chance. It is admitted by some correspondents that the British plan, on the surface, looks economical, and is an assistance to contractors, but there is a disinclination to break away from a practice which has been so long in operation here.

* * * *

In Canada, with a small population scattered over an immense area, the supply of pure water is a very serious problem. The difficulty in isolated places is to obtain water fit to drink, or to secure economical means of purification. Mr. M. H. McCready, the chemist of the Quebec Provincial Board of Health, has, after months of experimenting, perfected a device by which the proper quantity of hypochlorite solution is automatically introduced into the water as the latter courses into a miniature reservoir. All that is needed is a galvanised-iron or wooden tank or tub, a few pieces of glass tubing, with rubber attachments, a 3-litre bottle with rubber cork, and a ball stop-cock connection. The whole apparatus costs from £1 to £1 5s. The tank is 30 in. long, 18 in. wide, and 24 in. deep. This is sufficient to meet the requirements of an ordinary household, and the 3-litre bottle containing the sterilising solution will suffice for three or four days' water supply. One of the problems was to secure an appliance which would automatically measure out the proper dosage of hypochlorite, and a plan has been hit on by making use of the water pressure and the air pressure created by the latter. A scale has been set by which the quantity of hypochlorite allowed to percolate from the container is regulated according to the size of the various tubes and the containing reservoir. The Board of Health has information regarding the character and quality of water in every watercourse in the province, and those desiring to use the appliance will have to write to the [illegible] the solution jar proposed to be used. The board will [illegible] what quantities [illegible] to be employed. A trial will show [illegible] 1 [illegible] per [illegible] 20,000 = 240

CONSTRUCTION AND MAINTENANCE OF AMERICAN HIGHWAYS.

THE USE OF BITUMINOUS MATERIALS DURING 1911.*

By Arthur H. Blanchard, M.Am.Soc.C.E.,
Professor of Highway Engineering, Columbia University, New York City.

In December, 1910, the writer presented before the American Association for the Advancement of Science a paper entitled "The Present Status of the Use of Bituminous Materials in the Construction and Maintenance of Roads in the United States," which treated of the status of the art and science of this branch of highway engineering during 1908, 1909 and 1910. The development during 1911 of the use of bituminous materials is worthy of consideration.

That more permanent forms of construction are favoured by our State Commissions is clearly shown by the marked decrease in the use of light oils for surface treatment of roads, and the decided increase in the surface treatment of roads with heavy asphaltic oils and asphalt cements. As showing the general increase in the use of bituminous material in the construction of bituminous surfaces and bituminous pavements from 1908 to 1911, the total figures for the four years are given. The total number of square yards for each of the above years is: 1908, 416,700; 1909, 7,735,100; 1910, 18,244,600; 1911, 21,514,600. These totals include the yardage of road surface treated with light asphaltic oils. A comparison of more value and representing material progress along the lines of improved methods of construction and maintenance should be based on totals from which the yardage of road surface treated with light asphaltic oils is omitted. On this basis the total yardage is as follows: 1908, 416,700; 1909, 3,609,200; 1910, 8,327,700; 1911, 17,749,400.

A marked development under "bituminous surfaces" is in the increased use of various types of pressure and gravity distributors which have been specially designed for this work. The consequent abandonment of the use of pouring cans and ordinary watering carts for this work is to be commended. Many types of these machines have been used during the past year for this kind of work. It has been unfortunate that sufficient information has not been at hand covering the use of these various machines, so that an engineer might know the limitations of a machine before purchasing. Extravagant claims have been made by the designers and manufacturers of distributors. In a certain instance it has been claimed that materials, ranging in character from light oil to an asphalt cement of a consistency suitable for use in the construction of sheet-asphalt pavements, could all be distributed by a given machine in amounts per square yard varying from ⅛ gallon to 2 gallons.

During 1911 bituminous surfaces have not only been used extensively on macadam and gravel roads, but they have also been used to a considerable degree on cement concrete pavements. The improvement of the concrete pavement by the addition of the bituminous surface is marked, as, if the proper kind of bituminous material is used, the pavement is non-productive of dust, is not slippery, and is less noisy than the ordinary concrete pavement. There is no apparent reason why the results accruing from the use of bituminous surfaces on brick pavements would not be equally good. Especially would such be the case where bituminous fillers are used, thus combining many of the advantages of bituminous fillers and bituminous surfaces with the inherent good qualities of brick pavements.

In all the methods the construction is completed by the application of a thin coat of sand, stone chips or screenings.

Type A.—For the upper course broken stone is used containing sufficient small-sized particles to materially reduce the voids, as, for instance, crusher-run stone, which passes a 1½-in. screen, and is supposed to be retained on a ½-in. screen. In this method, after the upper course is laid, the bituminous material is applied either before or after the surface is rolled, some favouring the former, because of the greater depth of penetration secured. When the upper course is rolled after the application of the bituminous material, a coat of mineral matter has usually been spread over the surface before rolling. [illegible] for a second application or seal coat

* Extracts from a paper presented at the Washington meeting of Section D of the American Association for the Advancement of Science.

of bituminous materials is determined by traffic conditions in many cases, although standard practice in some departments is responsible for the use of one or the other method, independent of the traffic.

Type B.—In case the metal of the upper course is a uniform product of about 1 in. or 1½ in. in size, the bituminous material is applied after the course has been lightly rolled. Stone chips are then spread upon the surface and thoroughly rolled. After the surface is broomed, another coat of bituminous material is applied. The above method is also used when the road metal varies from 1½ in. to 2½ in., in which case ¾-in. stone is usually employed in place of chips.

Type C.—The foundation courses are filled to a certain extent with sand or small-sized broken stone, and after the course is rolled, excess mineral matter is swept off. After the upper course of road metal is applied, its voids are filled to within about 1 in. of the surface, and the bituminous material applied. The road is finished with a coat of sand or chips, which is rolled, although in some cases a second application of bituminous material and chips is used.

Type D.—A closely packed foundation or a concrete base is used, and large and uniform-sized stone employed for the wearing course. In this method a layer of sand, ¾ in. thick, is placed on the bottom course, and bituminous material distributed, using about 1 gallon per square yard. The upper course of metalling is applied, and the upper course thoroughly rolled, the bituminous mastic tending to fill the voids of the upper course. Another coat of bituminous material is applied, and the surface finished by the application of a coat or two or three applications of bituminous material are made, using likewise two coats of sand or chips.

Type E.—The upper course is constructed in the usual manner, and in place of sand or stone chips a bituminous mastic is applied to the surface, being rolled into the voids and forming the finished surface of the road.

Bituminous concrete pavements, in the aggregate of which broken stone forms an integral part, may be divided into three groups, as follows, the classification being based upon the character of the mineral aggregate:

Type A.—One-size aggregate, stone that . . . may be passed of a crushing plant.

Type B.—Combination of one-size coarse stone and fine mineral matter, such as sand, stone screenings and fine gravel.

Type C.—Evenly graded aggregate of broken stone and sand, or other mineral matter.

Naturally type A has been very popular, due to its inherent simplicity. During the past year the writer has seen excellent pavements constructed by this method where the aggregate was a one-size crusher-run stone, having the following characteristics based upon a mechanical analysis: all the stone passed a 1¼-in. sieve, not over 25 per cent passed a 1-in. sieve, and was retained on a ¾-in. sieve, and not over 5 per cent passed a ¼-in. sieve. Descriptions of such pavements of this type are legion.

The State Board of Public Roads of Rhode Island has used Type A since 1906. A mechanical analysis of a typical product used in Rhode Island may be of interest, and hence is given, below. Per cent passing 10-mesh sieve, 1·0; ¼-in. sieve, 2·5; ½-in. sieve, 30·8; ¾-in. sieve, 34·2; 1-in. sieve, 23·4; 1¼-in. sieve, 8·1. As deputy-engineer for the State Board of Public Roads of Rhode Island, the writer had charge of the construction and maintenance of bituminous surfaces and bituminous pavements for a number of years, and hence had the opportunity to inspect on numerous occasions the first section of bituminous concrete pavement constructed in 1906, under the above specification. This section has needed no repairs, although subjected to high-speed motor-car traffic of the heavy passenger type. Without doubt broad-minded judges would admit that this type of pavement has inherent stability.

During 1911 Type B was popular in various quarters. In Washington, D.C., under the jurisdiction of Captain Mark Brooke, of the office of the Engineer-Commissioner, bituminous concrete pavements were constructed under the following specifications, covering mineral aggregate: "The paving materials shall be composed of crushed trap-rock screenings, concrete, sand and mineral dust, in the following proportions: Trap-rock screenings, two parts; concrete sand, one part; and mineral dust, at least 5 per cent of the above aggregate, mixed with asphaltic cement." The trap-rock screenings referred to above varied in size from 1 in. to screenings, and were devoid of dust. Detailed specifications were also given with reference to the character of the sand and the mineral dust. The writer has had the good fortune to examine various streets paved under the above specifications. In his humble opinion, these pavements possess inherent stability under commercial traffic.

During 1911 many thousands of yards of a pavement of Type C have been laid. In the borough of Richmond, New York City, over 40,000 sq. yds. were laid on a total of eighteen streets last year under the direction of Theodor S. Oxholm, M.AM.SOC.C.E. The mineral aggregate used conformed to the now famous Topeka specifications.

Mention should be made of the effect of the introduction of various types of low-priced mixing machines during 1911. The economical and satisfactory results accruing from the use of these machines for mixing certain types of aggregates with bituminous cements has caused the introduction of the mixing method in many localities, where only the penetration method has formerly been used. During the season of 1912 many new machines of this type will be used with the consequent increase in the construction of the various types of bituminous concrete pavements outlined above.

During 1911 considerable thought has been devoted to the methods and materials employed in the construction of sheet-asphalt pavements. Notable work has been done by a Special Committee of the American Society for Municipal Improvements and the Committee of the Association for Standardising Paving Specifications. Throughout the United States there appears to be crystallising a firm belief that specifications for materials should be opened to admit such asphalt cements as "Bermudez," "California," "Pioneer," "Texaco," and "Trinidad," for instance, which have shown by service tests that excellent pavements may be constructed by their use. This tendency is commendable as thus competition is increased, and the high quality of the asphalt cement is maintained.

THE SEWERAGE OF FLEET, HANTS.

£30,000 SCHEME RECOMMENDED.

Mr. H. Percy Boulnois, M.INST.C.E., Westminster, who was retained to adjudicate upon three competitive schemes of sewerage for the urban district of Fleet, Hants, has recommended the carrying out of the one prepared by Mr. Moss-Flower, the cost being estimated at £29,732. The district is described by Mr. Boulnois as "somewhat difficult," and the scheme which he favours is regarded by him as the best and most practicable of those submitted. In his report Mr. Boulnois says it is evident that any attempt to obtain a cheap scheme of gravitation would result in failure, and asserts unhesitatingly that a scheme of that nature could not be carried out. In his view Mr. Moss-Flower has very wisely decided against a central pumping station, and has split up the district into various ejector lift areas, thus minimising the difficulties and expense of deep pump wells and tanks. He also thus lessens the depths of his proposed sewers, which, Mr. Boulnois points out, is another very important advantage both in cost of construction and availability.

Road Work in America. It is estimated that the expenditure on road work in the United States during the last twenty years has reached the colossal sum of £280,000,000. The State and local expenditures for 1911 aggregate £28,000,000, of which about £4,000,000 was devoted to highway improvements in the State of New York. In 1906 the Legislature at Albany appropriated for this purpose £10,000,000, of which about £200,000 has to be spent, but a Bill is now pending to borrow another £10,000,000 to continue the work. For the purpose of interesting the public generally in good roads, the Government took up the question officially in 1909, when an exhibit was formed and sent to the Seattle Exhibition, where it attracted so much attention that it has since been shown at several other cities. The railways then showed a keen interest in the matter, and operated road-improvement trains fitted for carrying exhibits and for lecturing purposes. The Government now maintains four exhibits showing the various methods of road construction, and these are shown at the State fairs and land and real-estate exhibitions.

Institution of Municipal Engineers.

JOINT EASTERN AND NORTH-EASTERN DISTRICT MEETING.

A joint meeting of these districts was held at Peterborough on Wednesday, July 3rd. Among the members present were Messrs. W. T. Unwin (chairman of the Eastern District of the institution), Philip S. Bennett (Ramsey), John S. Parrott (Downham Market), Robert Nelson (Norfolk), G. A. Penwill (Peterborough), Solden Hipwell (Chatteris), J. J. Howard (King's Lynn), John Bailey (Spalding), Robert Gibson (Norfolk), J. Kennedy (Norfolk), W. R. Bailey (Holbeach), G. Belson Chilvers (Oundle), N. E. Dixon (Oundle), G. F. Mayfield (Godmanchester), and R. G. Coates (honorary secretary of the Eastern District) and B. Wyand (secretary of the institution).

The party assembled at Peterborough Station, whence train was taken to Yaxley, where are situated the Fletton brick-making works of Messrs. Eastwood & Co., Limited. Arrived at the works, the members were met by Messrs. James F. Wyllie and H. K. Rolfe, representing the firm of Messrs. Eastwood & Co., and were conducted by them and the works manager (Mr. Dickinson) round the works, where the whole of the processes of brick manufacture by the dry process, including quarrying, grinding and screening of the raw material, and the subsequent moulding, pressing, drying and burning were seen. The following notes on the Fletton brick industry were furnished.

NOTES ON FLETTON BRICK MANUFACTURE.

The Fletton bricks as they are now known were first manufactured in 1880. Previous to this they were made largely by hand, much in the same way as in the time of the Pharaohs.

The wire-cut machine, now practically obsolete, in use about five years earlier, was only capable of working the top or plastic clay; this process entailed considerable time and labour, the clay alone taking some months to get properly weathered. The era of the "semi-dry" process simply revolutionised the industry.

The clay—of a shaley nature, which had hitherto been left as worse than useless—was found to have potentialities before undreamed of, both for economy of production and quality of the finished article, while the large percentage of natural gas which it contained made for further economy in the cost of burning. Clay grinding, elevating and pressing machinery (by Messrs. Scholfield, of Leeds) were first installed, and for some years these answered all purposes for speculative building, but responsible architects and others had during this time looked askance at the new brick, which from some standpoints certainly had imperfections. To meet their requirements, machinery by Messrs. Whittaker & Co., Accrington, and Messrs. Platts Bros. & Co., Oldham, was put in, with good results, and the bricks thus improved rapidly gained favour; but it was some years after the start that Messrs. Whittaker & Co. brought out their "re-press" or "four pressed" machine.

Messrs. Eastwood & Co. were among the first to recognise the superiority of this machine over its predecessors, and they installed a full four-pressed plant, with most gratifying results. Leading London and provincial architects and surveyors at once realised the marked improvement in quality, and found no hesitation in specifying these bricks to be used in their best contracts, especially where a large crushing strain was involved. Numerous improvements in the process of burning and manufacture have from time to time been added, not the least of these having been the utilisation of heat from burning bricks to dry other bricks in course of burning, known as the "hot air" process. New departures have also been made in the manner of grinding, screening and conveying the clay.

It might be mentioned, incidentally, that when the kilns were first erected it was thought necessary to line the internal walls with fire-bricks, but it was afterwards found that the Fletton bricks withstood the intense heat better than the fire-bricks.

The industry has increased to enormous proportions. Leaving out the comparatively new works at [illegible] Yaxley, Ecc Green, and Whittlesea, the Fletton firms are able to turn out about 6,000,000 bricks per week.

The process of manufacture of a four-pressed brick is briefly as follows:

The top soil and underclay or plastic clay is removed to within 2 ft. to 3 ft. of the "Knotts" or Oxford clay, which is approximately 40 ft. to 50 ft. deep. Being of a shaley nature, the clay is easily detached by bars and put into wagons, the various layers being alternately removed so as to obtain a good mixture, this being necessary in view of the varying shrinkage qualities of the several layers.

The wagons are conveyed on tram lines, either by manual labour or by endless chain up to the grinding mills, where the clay is tipped into the revolving perforated pans. Heavy rollers grind the clay to almost a powder, which passes into a receiver under the pan, and is then caught up by the elevator buckets and deposited on steel wire screens, through which the fine clay finds its way on to an endless conveyor belt, the tailings passing down another spout back into the grinding pans. From the conveyor the machines are fed direct. By an arrangement of "ploughs" across the belt, enough material is automatically detached to feed each separate machine, when it passes down a sack hopper and thence by means of a sliding feed-box into the first mould. The amount of material received into each mould can be regulated instantly, so that, as the material varies in point of dampness from time to time, more or less can be taken into the mould, the bricks being uniform throughout. After being subjected to a double nip pressure in the first mould the brick is automatically fed into a second mould, where it is again twice pressed, thus having some 80 tons pressure put on it four distinct times. For the first time during the process the material is touched by hand, and the finished brick is taken from the press and put on to barrows for removal to the kilns, where it remains drying and burning for from twelve to sixteen days, being then drawn and delivered straight into railway trucks. The kilns are of the continuous type, and hold from 250,000 to 300,000 bricks.

Something must be said, in conclusion, as to the effect of the change on the locality. What was only a comparatively short time ago a peaceful village with a few scattered houses is now a flourishing community, linked to Peterborough without a break with well-built houses, good roads and footpaths, well-lighted streets, a separate drainage scheme with sewage disposal works, and a water supply second to none in the kingdom. The death-rate is low—11·6, compared with 14·6 for England and Wales. The birth-rate is high—26·6, as against 24·4 for England and Wales. There are also large elementary schools, with 650 scholars, and secondary schools. The locality, comprising Fletton and the neighbouring parishes of Stanground and Woodston, is controlled by an urban district council.

At the subsequent meeting the chair was taken by Mr. W. T. Unwin, the chairman of the Eastern District, and a vote of thanks to Messrs. Wyllie, Rolfe and Dickinson, and to Messrs. Eastwood & Co., for the courtesy extended to the members, was passed.

The minutes of the last meeting of the Eastern District and the North-Eastern District respectively were then read and approved.

The next item on the agenda was the election of officers for the Eastern District for the current financial year, and it was proposed by Mr. P. S. Bennett (Ramsey), and seconded by Mr. J. S. Parrott (Downham Market), that the present chairman be re-appointed.

The Chairman said that he had had the honour of occupying the position for the past two years, and he thought it would be wiser to distribute these appointments more. He had been very pleased to hold the office, although pressure of work had prevented him latterly from doing as much as he had wished. A change would in every way be better; of that he was convinced. Others were equally competent to carry out the duties of chairman, and by distribution interest would be increased. He would propose, therefore, that the reins of office be placed in the hands of Mr. Hipwell, and all would agree that no more suitable man than Mr. Hipwell could be found. He (Mr. Unwin) would be pleased to render Mr. Hipwell every possible assistance.

Mr. Solden Hipwell (Chatteris) thanked Mr. Unwin for bringing his name forward, but he felt that he could not carry out the duties as Mr. Unwin had done.

He quite agreed as to the chair being passed round as far as possible; none the less Mr. Unwin was doing very well, and he would like to see him retain it for another year at least.

Mr. R. G. COATES (Norfolk) hoped that Mr. Hipwell's dissent was not a refusal, and that he would leave the final election to the meeting. He (the speaker) also agreed as to the principle of distribution, as it would certainly add zest to their proceedings. Fresh blood was good, and he could say, without casting any reflection upon their present chairman, that it must always be to their benefit to change.

Mr. G. B. CHILVERS (Oundle) seconded Mr. Unwin's proposition, but, Mr. Hipwell remaining obdurate and no other proposition being forthcoming, Mr. Bennett's motion was carried unanimously.

The CHAIRMAN, in returning thanks for his re-election, expressed the hope that the district would confer the honour elsewhere when this his third year of office was up. He would do all he could to further the interests of the institution, and he would add his share to the excellent work that was being done by the institution in the direction of obtaining superannuation and security of tenure for the members of the profession. They were all now in possession of their full vigour—who should say what to-morrow might bring forth! They ought to be recognised precisely as were the Poor-law officers. Meetings such as their meeting that day were very well in their way, and very necessary; but there were matters of equal importance to technical improvement. No effort must be spared to the desired end, and their institution was *par excellence* the body to move in the matter. As regards the future of the institution, that was, of course, long since assured; but none the less each must contribute his share to the general work, with the inevitable result that it would rank second to none among the professional bodies of the country. To come down to the business in hand, however—*viz.*, the appointment of their honorary district secretary—he felt that they could not do better than re-elect Mr. Coates, who had done so excellently in the past.

Mr. J. KENNEDY (Norfolk) then proposed, and Mr. HIPWELL seconded, that Mr. Coates be re-elected honorary district secretary for the current financial year.

Mr. COATES was of the opinion that the remarks as to distribution referred equally to his own office. He had originally undertaken the duties simply to start the district, and he had been in office ever since! He had wished to retire last year, and had only continued under great persuasion. There had been few meetings, but meetings of interest such as the one held that day were difficult to arrange. To meet and merely to read the minutes of the last meeting was not an attractive programme. As those present would know, he was a member of the council, and he could assure them that superannuation and security of tenure were by no means being lost sight of in London. They were being energetically pursued, and might safely be left in the hands of the council. He would retain his office as honorary district secretary if they pressed it upon him, but he hoped they would make a change, and he would suggest the election of Mr. P. S. Bennett.

Mr. R. GIBSON (Norfolk) then proposed, and Mr. COATES formally seconded, the election of Mr. Bennett, and the proposition was carried unanimously.

Owing to the length of the proceedings, the election of officers for the North-Eastern district had to be postponed, only just sufficient time being left to catch the train back to Peterborough.

On the return to Peterborough a visit was paid to the Cathedral, and later, after tea, those members whom train services permitted to remain were conducted round the town by Mr. G. A. Penwill, who had kindly arranged the local programme.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangement well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By Sydney G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

STOURBRIDGE GASWORKS.*

By C. H. WEBB, M.SC., ASSOC.M.INST.C.E., Gas Engineer.

The works were established in 1835 by a company of six shareholders, but it was not until twenty years later that they were incorporated by the Stourbridge Gas Act of 1855. The maximum price of gas mentioned in the Act is 6s. per 1,000 cub. ft., and there is included a purchase clause in favour of the local authority. In all other respects the Act is in the usual form. The undertaking was purchased by the Urban District Council of Stourbridge, as and from December 31, 1892, at a price of about £100,000. The works are not situated in the area of the Stourbridge Urban District Council, but immediately over the boundary in Amblecote parish, Staffordshire. The present district supplied comprises Stourbridge, Amblecote, Lye, Wollescote, Pedmore, Hagley, Clent, Belbroughton, and part of Wordsley, with an area of 15,308 acres and a population of 39,915. The output of gas is high in proportion to the population, the area having, in addition to residential parts, large manufacturing districts with a working-class population. A large percentage of the gas is supplied for power and other trade uses, and there is also a heavy consumption by prepayment meters, gas fires and cookers. The following comparison will show the progress made in the period that the works have been the property of the urban district council:—

	1892.	1911-12.
Annual make of gas	96,000,000 c. ft.	231,182,000 c. ft
Main mileage	37	60
No. of consumers	1,340	ordinary 2,243; prepayment 5,363
Public lamps	676	825
Tons of coal carbonised	8,457	21,136
Capital	£47,500	(balance of loan) £95,172
Gross profit	£4,787	£11,366
Price of gas	2/8	2/8, 2/6, 2/-, 1/9, and 1/6 (according to quantity and use)
Gas cookers in use	nil	2,634
Slot meters	nil	5,363

The plant comprises: Retort-house, containing eight beds of eight retorts (21 ft. by 22 in. by 16 in.), with Klonne regenerative furnaces, and worked with West's manual machinery; vertical water-cooled tubular condenser; two steam-driven exhausters; Livesey washer; rotary washer; five purifiers, 30 ft. by 20 ft.; station meter; three gasholders, combined capacity 1,100,000 cub. ft.; pressure-raising or boosting plant and station governors (20-in., 16-in., 12-in., and 12-in. safety governor). Humphreys and Glasgow carburetted water-gas plant, of 500,000 cub. ft., is now being erected, and two Lancashire boilers (24 ft. by 8 ft. diameter), to replace old egg-ended ones now in use, are being installed.

The works are served by a high-level railway siding connected with the Great Western Railway for delivery of coal, sulphuric acid for the manufacture of sulphate of ammonia, for stores to cooker repairing and fitting shops, and the removal of sulphate of ammonia, oxide of iron, &c. There is also a low-level railway siding for loading coke, and the tar produced can be loaded into boats on the canal adjoining the works by gravity from the sales tank. In view of the demand for tar for road purposes, Wilton's tar-dehydrating plant has recently been installed, and a description of this will perhaps be of interest. The special feature of this particular plant is that it is on the enclosed system, the tar being dealt with in a slow, continuous stream instead of in bulk.

By this means the constancy of the finished product is more readily assured, and this is an important point when working to the Road Board's specification, which can be done with this plant. The principle of the process is that the tar is heated (to about 160 deg. Cent.) when under pressure (about 30 lb. per square inch), and then released, when the water and light oils, being at a temperature higher than their respective boiling points, are evaporated, and leave the dehydrated and acid-free tar behind. The plant at Stourbridge is capable of dealing with 100 gallons of crude tar per hour. The tar is supplied from the land-sale tank by gravity into a suction or feed tank, from which it is continuously pumped through a preheater or economiser, the coils of which are surrounded by hot dehydrated tar. After absorbing some of the heat in this, the crude tar then passes to the still, which is a brick structure containing about twelve laps of coiled piping, heated by a small breeze furnace with forced draught. The crude tar when passing through the coil is still further heated, and

* Paper read at the meeting of the Institution of Municipal and County Engineers at Stourbridge last Saturday.

on leaving the still the pressure is suddenly reduced in the vapour box, where there is a free space provided. The water and light oils, being at a high temperature, are vaporised, and leave the tar, which latter flows away through the preheater, where it parts with some of its heat, on to the store tank for sale. From the top of the vapour box the vapours pass through a coiled condenser surrounded by cold water, and thence to the receiver, where the ammoniacal liquor and light oils separate by gravity. The liquor is run back to the works well, while the light oils are barrelled and sold. The plant is simple, easily worked, and, from the reports received from other works where the process has been carried on for extended periods, gives very little trouble. It is necessary to obtain a certificate of registration under the Alkali, &c., Works Regulation Act, 1906, and the plant is regularly examined by the Government inspector.

As the greater portion of the dehydrated tar will probably be required in the summer months, when the gasworks output is at a minimum, it is essential that there should be ample storage for crude tar, and also to allow for rushes of work on the roads when the weather is fine, there should be good storage for the finished product. As road engineers, you are doubtless most keenly interested in keeping the cost of the dehydrated tar as low as possible, and consequently your attention should be directed towards ensuring that the barrels used for packing should be treated by your men with the greatest care, and returned promptly. To pack a ton of dehydrated tar five barrels are required; cost at present prices, 5s. each. As the cost of these barrels has to be charged in the price of the tar, it will be seen that if the barrels can be made to last an increased number of journeys, say eight instead of six, before being scrapped, the cost of packing per ton is reduced from 4s. 2d. to 3s. 1½d., or over 1s. per ton.

SOME RECENT PUBLICATIONS.*

Everybody's Guide to the National Insurance Act, 1911. By Thomas Smith, Barrister-at-Law. Price 1s. London: Chas. Knight & Co., Limited.

So many people are affected by the National Insurance Act—which brings within its provisions some 14,000,000 persons—that it is by no means surprising to find this is the second edition of Mr. Smith's "Guide." His labours have thus borne good fruit, not undeservedly so, as it would appear that the work has successfully achieved its purpose of guidance with respect to a subject whose complications are as notorious as, in a sense, they are also unavoidable. The regulations of the National Insurance Commissioners and the Board of Trade are explained so clearly as to bring them within range of the ordinary human understanding, and those who are affected by the National Insurance scheme may consult this authority not merely with profit but likewise with some degree of interest.

We have also received Messrs. Charles Knight's "Householder's Cabinet," which is designed to facilitate the carrying out the provisions of the National Insurance Act by mistresses of households. The cabinet is divided into three compartments, one containing a copy of "Knight's Householder's Help," while the second is designed for the servants' contribution cards, and the third for emergency cards. In addition the lid is furnished with a pocket for in[illegible] stamps.

Practical Method of Sewage Disposal. By Ogden and Cleveland. Price 6s. 6d. nett. New York: John Wiley & Sons.

This book treats entirely of methods of sewage disposal for residences, hotels and institutions. These methods are adaptations of the well-known principles of the septic tank, sub-surface irrigation, sand filtration and broad irrigation to plants of small size. No new principles are developed, and the various chapters are concerned chiefly with details of construction.

To engineers familiar with the author's previous books on sewer design and sewer construction this book will be regarded as merely a supplement but to the general reader not familiar with the subject it will prove of interest. It is not, however, a sufficient guide for a layman attending to local work, and in some respects may prove misleading to him. For example, the chapter on Estimation of Costs describes methods of estimating, but gives no idea of what an actual plant is likely to cost. Nothing is said in regard to the operation of plant after construction, and this is one of the most important features of the subject, and one almost universally ignored by the owner. The author assumes that cesspools are not to be recognised as a proper method of sewage disposal, yet many competent sanitarians believe that under proper conditions and with proper care they furnish a method of disposal quite as satisfactory as a more elaborate plant that is not well taken care of.

Public Works and Engineering Review of Reviews, No. 3 of Vol. xii. (Civil Engineering Press. Price 5s. per annum).—The current quarterly issue of this magazine, dated July, shows a marked improvement by comparison of its literary contents with those of the preceding issue. Among its chief contents are the editorial notes, which might, we think, be extended beyond the two pages they fill; some information as to the new premises of the Institution of Civil Engineers, with summaries of the two papers as to Madras Harbour, recently read before that body; the conclusions of papers on "Engineering Plant in Institutions," and "Water and Petroleum Boring and Machinery;" details of recent extensions of the Singapore waterworks; and the "Review of Reviews" section, which is a record of the principal articles in recent issues of the leading engineering journals. *Public Works* is certainly the most sumptuous of such journals in its typographical excellence.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

THIRTY-NINTH ANNUAL GENERAL MEETING.

The annual meeting of the institution, which opened yesterday in the Council Chamber, Caxton Hall, Westminster, will be continued there to-day, and conclude to-morrow at the County Hall, Aylesbury.

To-day's Programme.

10 a.m.—Discussion on the following papers (to be taken as read):

(6) "Maintenance of Sewers in Hampstead," by O. E. Winter.

(7) "Bituminous-bound Carriageways," by J. S. Brodie.

(8) "Road Maintenance in County Armagh," by R. H. Dorman.

(9) "Scottish Roads," by Allan Stevenson.

(10) "How the New District Committees may Promote the Progress of the Institution," by A. H. Campbell.

1 p.m. Adjournment for lunch.

Programme of Visits.

Party "A"—Norwood.

2.30 p.m.—The party will assemble at Victoria Station (London, Brighton and South Coast Railway). Members will book independently.

2.43 p.m.—Depart for Crystal Palace (change).

3.20 p.m.—Arrive Norwood Junction.

Proceed to inspect reinforced concrete subway, 9 ft. 6 in. diameter, by invitation of Mr. G. F. Carter, who will kindly conduct the party over the work.

Party "B"—Sideup.

2.40 p.m.—The party will assemble at Charing Cross Station (South-Eastern and Chatham Railway). Members will book independently to New Eltham.

2.50 p.m.—Train leaves for New Eltham, where members will alight on the outward journey.

3.32 p.m.—Inspection of sections of road, of various materials, laid for testing by the Kent County Council, for the Road Board, *en route* to Sideup.

Party "C"—Hampstead.

2.45 p.m.—The party will assemble at Golder's Green Station. Guides will meet the party to conduct them through the Hampstead Garden City. Members will travel independently.

Party "D"—Westminster.

2.45 p.m.—The party will assemble at Westminster Bridge (south side) at the London County Council County Hall, in course of erection by Mr. Ralph Knott and Mr. W. E. Riley, and proceed to inspect the works, by kind invitation.

TO-MORROW'S PROGRAMME.

Visit to Aylesbury, Tring, &c.

9.15 a.m.—The members will assemble at Marylebone (Great Central Railway).

9.25 a.m.—Depart for Aylesbury.

10.45 a.m.—Arrive Aylesbury. Proceed to the County Hall. The members will be received by Mr. Tonman Mosley, C.B., chairman of the Buckinghamshire County Council, and Mr. H. L. Nippin, J.P., chairman of the Aylesbury Urban District Council.

Discussion on the following paper (to be taken as read):—

(11) "Municipality Work in Aylesbury," by W. H. Taylor.

Proceed by conveyances along roads bituminously bound, tar-painted, &c., to the Chiltern Hills Spring Water Company's works, near St. Leonards (by kind permission of the chairman and directors), where members will be received by Mr. H. A. Callon, assistant manager.

1.45 p.m.—Leave for Tring.

2 p.m.—Luncheon at the "Rose and Crown" Hotel.

3 p.m.—The Honourable Walter Rothschild will receive the members at his museum, over which he has kindly consented to conduct the party.

It is hoped that arrangements can be made for affording members an opportunity of seeing the grounds of Tring Park.

4 p.m.—Leave for Aylesbury.

4.45 p.m.—Arrive at Aylesbury, where tea will be provided at "The Chantry" by the president.

Members attending the annual meeting are invited to use the Municipal County Club as hon. members.

CHAS. JONES, M.INST.C.E.,
Hon. Secretary.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

THOMAS CAIN,
11 Victoria-street, S.W. *Secretary.*

ROYAL SANITARY INSTITUTE.

ANNUAL CONGRESS AND EXHIBITION AT YORK.

The annual congress of the Royal Sanitary Institute, which is to take place this year at York, will open on July 29th. The proceedings will commence with a reception of the members and delegates in the Mansion House by the Lord Mayor, a public luncheon following, and in the evening the inaugural address to the congress will be delivered by the Archbishop of York.

On Tuesday, July 30th, a conference of municipal representatives and of engineers and surveyors will be held in the Exhibition Buildings, and on Friday, August 2nd, and the following day, the Engineering and Architecture Section will meet in the Museum. Mr. A. D. Greatorex, M.INST.C.E., borough engineer and surveyor of West Bromwich, will preside at the conference of engineers and surveyors, and the section devoted to engineering and architecture will have as its chairman Mr. J. Walker Smith, M.INST.C.E., chief engineering inspector to the Local Government Board for Scotland.

At the conference of engineers and surveyors discussions will take place on, among others, the subjects of Housing and Town Planning Progress, to be opened by Mr. H. Gilbert Whyatt, ASSOC.M.INST.C.E., borough engineer and surveyor, Grimsby, and Sewage Disposal in Rural Districts, to be opened by Mr. Ascough Rodwell, surveyor to the Skipton Rural District Council. The question of the modification of the Model Building By-laws from the rural point of view will be considered in the Engineering and Architecture Section.

The opening of the Health Exhibition arranged in connection with the congress has been fixed for Saturday, July 27th.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. STICKLAND, ASSOC.M.INST.C.E., Borough Surveyor, Windsor.

NORTHERN DISTRICT.

A meeting of the above will be held at Keswick to-morrow (Saturday).

PROGRAMME.

10.15 a.m.—Meet at town hall. Short paper by Mr. P. M. Hope, on "Keswick and its Municipal Undertakings."

11 a.m.—Leave town hall for Thirlmere waterworks (Manchester supply).

Light refreshments at Nag's Head Hotel, Wythburn, after inspecting waterworks.

1.30 p.m.—Drive to top of Dunnail Raise to inspect new road made by the Cumberland County Council.

2 p.m.—Drive west side of Thirlmere Lake (over road made and maintained by the Manchester Corporation) to inspect dam and valve house.

2.30 p.m.—Inspect Smaithwaite Bridge and drive through Vale of St. John's to Threlkeld.

3 p.m.—Inspect Threlkeld Granite Quarries with the kind permission of the Threlkeld Granite Company.

4 p.m.—Return journey to Keswick.

7.0 p.m.—Dinner at Keswick.

The return train leaves Keswick on Saturday evening at 6.29, arriving in Newcastle at 11.5.

JOHN ROBINSON,
Union Offices, *Hon. District Secretary.*
Darlington.
July 4, 1912.

CLITHEROE MEETING.

This meeting has been postponed until Saturday, 27th inst., owing to the meeting arranged at Keswick for the 13th, the original date fixed upon for the Clitheroe meeting. Full programme of the meeting will be issued within a few days.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

ROYAL INSTITUTE OF PUBLIC HEALTH CONGRESS IN BERLIN.

THE MUNICIPAL ENGINEERING, ARCHITECTURE AND TOWN PLANNING SECTION.

The Congress of the Royal Institute of Public Health, which opens on Thursday, July 25th, in Berlin, and extends over three days, will be conducted in five sections, the one of special interest to our readers being that devoted to Municipal Engineering, Architecture and Town Planning—over which Mr. P. C. Cowan, D.SC., M.INST.C.E., chief engineer of the Local Government Board of Ireland, will preside, among the vice-presidents being Prof. Henry Adams, M.INST.C.E., Sir Alexander R. Binnie, M.INST.C.E., Mr. John A. Brodie, M.INST.C.E. (city engineer of Liverpool), Mr. W. B. Bryan, M.INST.C.E. (chief engineer of the Metropolitan Water Board), Mr. A. D. Greatorex, M.INST.C.E. (borough engineer of West Bromwich), Sir James Lemon, M.INST.C.E., Mr. T. de Courcy Meade, M.INST.C.E. (city engineer of Manchester), Prof. W. C. Unwin, F.R.S. (president of the Institution of Civil Engineers), Mr. G. W. Willcocks, C.B., M.INST.C.E. (chief engineer to the Local Government Board), and Sir John Wolfe-Barry, K.C.B., F.R.S. Mr. A. J. Martin, M.INST.C.E., is one of the secretaries of the section.

The papers to be read during the three days on which the section will meet include:—

"Water Supply in London," by W. A. Richardson, ASSOC.M.INST.C.E., assistant engineer to the Metropolitan Water Board.

"British Practice in Sewage Disposal," by A. J. Martin, M.INST.C.E.

"Sewer Ventilation," by T. de Courcy Meade, M.INST.C.E.

"Building By-Laws," by J. D. Cassewell.

"Town Planning," by Thos. Adams, town planning assistant to the Local Government Board.

"Legal Aspects of Town Planning," by R. E. Willcocks.

"Use of Reinforced Concrete in Architecture," by Prof. Henry Adams, M.INST.C.E.

"The Use of Reinforced Concrete in Engineering," by J. H. Waller.

Papers dealing with the sewage arrangements of Berlin, water sterilisation and street cleaning will be contributed by German delegates to the congress.

Visits to a large number of public institutions in and around Berlin have been arranged in connection with the gathering.

INSTITUTE OF SANITARY ENGINEERS.

President—Mr. A. J. Martin, M.INST.C.E., F.G.S., F.R.SAN.I.

SUMMER VISIT TO BIRMINGHAM.

Arrangements have been made for a week-end visit to Birmingham, starting to-day. The Midland Hotel, where a private sitting-room will be set apart for the party, and where the reception dinner attended by the Lord Mayor, will be held, has been selected for headquarters.

Friday, July 12th.

9.10 a.m.—Train leaves Paddington.

11.10 a.m.—Arrive in Birmingham and proceed to Midland Hotel.

1 p.m.—Reception by the Lord Mayor, Alderman Bowater, at the Council House.

Sessional meeting in the afternoon, discussion on papers.

7 p.m.—Dinner, the president in the chair.

Saturday, July 13th.

10 a.m.—Leave hotel by coaches to visit sewage farm, filter-beds, &c., and return to hotel.

Visits to University and other places of interest.

P. N. Hasluck,
Secretary.

120 and 122 Victoria-street, S.W.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1339 Holborn), subject to later confirmation by letter.*

SURVEYOR AND INSPECTOR OF NUISANCES.—July 13th.—Newport Pagnell Rural District Council. £200—£240.—Mr. Charles W. Powell, clerk.

SURVEYOR OF HIGHWAYS.—July 13th.—Whittington and Newbold Urban District Council.—Mr. H. J. Watson, clerk, 32 Gluman-gate, Chesterfield.

INSPECTOR OF NUISANCES.—July 13th.—Corporation of Chester. £90—£110 per annum.—Mr. J. H. Dickson, town clerk.

CITY SURVEYOR.—July 15th.—Corporation of Ripon. £150—£200.—Mr. M. Kirkley, town clerk.

CLERK OF WORKS.—July 16th.—Willesden Urban District Council. £175 per annum.—Mr. S. W. Ball, Municipal Offices, Dyne-road, Kilburn.

ASSISTANT SURVEYOR IN BOROUGH ESTATE OFFICE.—July 18th.—Corporation of Swansea. 30s. per week.—Borough Estate Agent, 3 Prospect-place, Swansea.

CLERK OF WORKS.—July 17th.—Godstone Rural District Council. £3 per week.—Mr. E. Alston Head, clerk, East Grinstead.

CLERK OF WORKS.—July 18th.—Walsingham Rural District Council. £3 3s. per week.—Mr. R. S. Butcher, clerk, Fakenham.

SUPERVISING ROAD FOREMAN.—July 19th.—Corporation of Grimsby. £2 15s. per week.—Mr. H. Gilbert Whyatt, borough engineer and surveyor.

BUILDING INSPECTOR.—July 20th.—Corporation of Bradford. £120 per annum.—Mr. Frederick Stevens, town clerk.

INSPECTOR OF NUISANCES.—July 22nd.—Mynyddislwyn Urban District Council. £80 £100.—Mr. F. C. Griffiths, clerk, Blackwood, Mon.

HIGHWAY SURVEYOR.—July 26th.—Newbury (Berks) Rural District Council.—£100 per annum.—Mr. S. V. Pinniger, clerk, Market-place, Newbury.

ASSISTANTS TO COUNTY SURVEYOR.—July 27th.—West Sussex County Council. £130—£150.—Mr. H. W. Bowen, county surveyor, 23 North-street, Horsham.

CLERK OF WORKS.—About middle of July.—Essex County Council. £3 3s. per week.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

HIGHWAY SURVEYOR AND INSPECTOR.—July 27th.—Wantage Urban District Council. £140 per annum.—Mr. E. B. Ormond, clerk.

CHIEF ASSISTANT.—July 29th.—Corporation of Clydebank. £120 per annum.—The Town Clerk, Municipal Buildings, Clydebank.

INSPECTOR OF NUISANCES.—July 29th.—Elham Rural District Council. £120 per annum.—Mr. B. C. Drake, clerk, Hythe, Kent.

ASSISTANT ENGINEER.—August 31st.—Darjeeling Municipality, India. 150 rupees monthly.—The Chairman.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1339 Holborn), subject to later confirmation by letter.*

CARDIFF.—August 6th.—Designs and estimates for fire station.—The Town Clerk.

GOOLE.—September 1st.—Competitive designs and estimates for municipal offices, for the urban district council. Two premiums (£30 and £15).—Mr. R. Tyson, clerk.

CHORLEY.—September 9th.—Designs for a school, for the corporation.—Mr. J. Mills, town clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas.—Mr. J. Henry Field, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1339 Holborn), subject to later confirmation by letter.*

Buildings.

BRIDLINGTON.—July 13th.—For the erection of twenty-five workmen's dwellings, for the corporation.—Mr. E. R. Matthews, borough surveyor.

WEDNESBURY.—July 13th—31st.—For alterations and additions to public baths and municipal offices, for the corporation.—Mr. T. Jones, town clerk.

ESSEX.—July 13th.—For additions to a school, for the Education Committee.—Mr. W. Adams, clerk, 14 Church-street, Saffron Walden.

WALSALL.—July 13th.—For alterations to a school, for the corporation.—Borough Surveyor.

DERBYSHIRE.—July 15th.—For the erection of a school, for the Education Committee.—Mr. G. H. Widdows, architect, St. Mary's Gate, Derby.

WHITLEY AND MONKSEATON.—July 15th.—For the erection of boundary wall, gate piers and gates, for the urban district council.—Mr. A. J. Rousell, surveyor.

BARROW-IN-FURNESS.—July 15th.—For the extension of the electricity works, for the corporation.—Borough Engineer and Surveyor.

HANTS.—July 15th.—For the construction of two culverts and other works, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

FINCHLEY.—July 15th.—For the construction of an underground convenience, for the urban district council.—Mr. E. H. Lister, clerk.

DEWSBURY.—July 15th.—For the erection of a fire station, for the corporation.—Borough Surveyor.

WOOLWICH.—July 15th.—For the erection of a waiting-room and sanitary convenience, for the borough council.—Mr. Arthur B. Bryceson, town clerk.

PEMBROKE (Co. Dublin).—July 15th.—For the erection of forty-three dwellings, for the urban district council.—Mr. J. H. Middleton, surveyor.

KENT.—July 15th.—For extensions to technical institute, for the Education Committee.—Dr. J. Lister, Technical Institute, Tunbridge Wells.

HORBURY.—July 16th.—For the erection of boundary wall and asphalting playgrounds, for the Education Committee.—Education Offices, Northgate, Wakefield.

COVENTRY.—July 16th.—For the erection of a shoeing and repair shop, for the corporation.—Mr. J. E. Swindlehurst, city engineer.

WOOD GREEN.—July 16th.—For additions and repairs to schools, for the Education Committee.—Mr. W. P. Harding, clerk, Town Hall.

DURHAM.—July 16th.—For alterations and additions at council schools, for the Education Committee.—Mr. W. Rushworth, Shire Hall, Durham.

LEEDS.—July 16th.—For the erection of two dwellings, for the corporation.—Mr. W. T. Lancashire, city engineer.

CLONAKILTY.—July 16th.—For the erection of five houses, for the urban district council.—Mr. J. Donovan, town clerk.

KINSALE.—July 17th.—For the erection of cottages and fencing of plots, for the rural district council.—Mr. J. Murphy, clerk.

HEREFORD.—July 17th.—For the erection of new roof on the butter market, for the corporation.—City Surveyor.

POOLE.—July 17th.—For supply and driving oak piles, and repairing oak sill of quay, for the corporation.—Mr. J. Elford, estate surveyor, Municipal Offices.

FULHAM.—July 17th.—For repairs to economiser-house, and sinking two additional piers for foundations, for the borough council.—Mr. J. Percy Shuter, town clerk.

KENT.—July 18th.—For repairs and painting at a council school, for the Education Committee.—Mr. W. J. Spicer, 19 Bank-street, Ashford.

LANCASHIRE.—July 18th.—For the erection of an infants' school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

CROYDON.—July 18th.—For extensions and painting at the South Norwood school, for the Education Committee.—Mr. J. Smyth, clerk, Education Office, Katherine-street, Croydon.

WEST RIDING.—July 19th.—For alterations to playground entrance, and rebuilding walls of school, for the Education Committee.—Mr. Francis Alvey Darwin, clerk.

CARDIFF.—July 19th.—For the erection of a ferro-concrete boat shelter, for the corporation.—Mr. W. Harpur, city engineer.

RUNCORN.—July 19th.—For the construction of an underground reservoir, for the rural district council.—Mr. G. F. Ashton, clerk.

GLASGOW.—July 20th.—For relining chimney stalk with firebrick, for the corporation.—Mr. J. Lindsay, town clerk.

KENT.—July 20th.—For works of painting and repairs at a council school, for the Education Committee.—Mr. H. Fielding, 15 Burgate-street, Canterbury.

WILLITON.—July 20th.—For the construction of a seawall about 50 yds. long, timber groyne, and other incidental works, for the rural district council.—Mr. Frank Risdon, clerk, Williton, Somerset.

EVESHAM.—July 22nd.—For alterations and additions to a cottage, for the corporation.—Borough Surveyor.

NORTHAMPTON.—July 22nd.—For the masonry and other works required in the widening of the South Bridge over the river Nene in three arched spans, for the corporation.—Mr. Herbert Hankinson, town clerk.

BECKENHAM.—July 22nd.—For the erection of caretaker's lodge and public conveniences, for the urban district council.—Mr. J. A. Angell, surveyor.

BERWICK-UPON-TWEED.—July 23rd.—For the construction of a service reservoir to hold about 700,000 gallons, for the sanitary authority.—Mr. W. Weatherhead, clerk.

DERBYSHIRE.—July 24th.—For the erection of a lock-up, courthouse and residence, for the Standing Joint Committee.—Mr. N. J. Hughes-Hallett, clerk, County Offices, Derby.

STOURBRIDGE.—July 25th.—For the construction of a covered service reservoir of a capacity of 500,000 gallons, and other works, for the District Water Board.—Mr. J. Donaldson Harward, clerk, High-street, Stourbridge.

BEDFORD.—July 25th.—For repairs to council schools, for the County Education Committee.—County Surveyor, Shire Hall, Bedford.

BURNLEY.—July 27th.—For the concrete work in the repair of the sewage tanks, for the rural district council.—Mr. H. Pritchard, engineer.

ST. HELENS.—July 31st.—For the erection of a public library, for the corporation.—Mr. A. W. Bradley, borough engineer.

Iron and Steel.

SWINDON.—July 13th.—For the supply of unclimbable wrought-iron fencing, gate and posts, for the corporation.—Mr. H. J. Hamp, borough surveyor.

BOURNE.—July 15th.—For the supply of cast-iron pipes and valves, for the rural district council.—Mr. T. Lake, district surveyor.

WEST BROMWICH.—July 16th.—For the removal of the existing centre tramway poles, and the supply and erection of additional poles and other works, for the corporation.—Mr. A. D. Greatorex, borough engineer and surveyor.

ISLINGTON.—July 24th.—For the supply of 3,000-kw. steam turbine alternator, exciter, condensing plant, switch gear, and circulating and steam piping, for the borough council.—Mr. W. F. Dewey, town clerk.

STOURBRIDGE.—July 25th.—For the supply and delivery of about 857 tons of cast-iron pipes, for the District Water Board.—Mr. J. Donaldson Harward, clerk.

Roads.

STOCKPORT.—July 13th.—For street-making work, for the corporation.—Mr. J. Atkinson, borough surveyor.

FLINT.—July 15th.—For making up certain streets, for the corporation.—Mr. Hugh Owen, borough surveyor.

HALTWHISTLE.—July 15th.—For making up several streets, for the rural district council.—Mr. Thos. Dryden, clerk.

CHESHUNT.—July 15th.—For providing and laying about 1,800 super. yds. of artificial paving slabs, for the urban district council.—Mr. J. E. Sharpe, engineer and surveyor.

WEST HAMPNETT.—July 15th.—For steam rolling work, for the rural district council.—Mr. W. O. Rasell, acting clerk, Council Offices, South-street, Chichester.

GOOLE.—July 15th.—Making up a street, for the urban district council.—Mr. Robert Tyson, clerk.

PEMBROKE (Co. Dublin).—July 15th.—For the construction of roads and sewers, for the urban district council.—The Clerk.

BLACKBURN.—July 15th.—For making up certain streets, for the corporation.—Mr. W. Stubbs, borough engineer.

STANLEY.—July 15th.—For works of making up, for the urban district council.—Mr. A. Routledge, surveyor.

KENDAL.—July 16th.—For work of making up, for the corporation.—Mr. F. W. Oxberry, borough surveyor.

TOTTENHAM.—July 16th.—For making up a road, for the urban district council.—Mr. W. H. Prescott, engineer.

GLAMORGAN.—July 17th.—For kerbing and widening, for the county council.—Mr. T. Mansel Franklin, clerk, County Council Offices, Cardiff.

TAMWORTH.—July 17th.—For works of paving, kerbing and channelling, for the corporation.—Mr. F. E. G. Bradshaw, borough surveyor.

DUNDEE.—July 17th.—For the supply of 1,000 tons of road metal, and 400 tons of causeway setts, for the Harbour Trustees.—Mr. J. Hannay Thomson, general manager and engineer.

BACUP.—July 17th.—For granite paving work, for the corporation.—Mr. W. H. Elce, borough engineer.

OLDHAM, July 18th.—For making up several passages, for the corporation.—Chairman of the Surveyor's Committee.

WANDSWORTH.—July 20th.—For the purchase of a Leyland patent steam motor wagon, fitted with interchangeable tipping body and 1,000-gallon tank for street watering, for the borough council.—Mr. P. Dodd, borough engineer.

CHELTENHAM.—July 20th.—For providing and laying 5,000 sq. yds. of creosoted deal block pavements, for the corporation.—Mr. J. S. Pickering, borough engineer.

HALIFAX.—July 20th.—For carrying out private improvement works, for the corporation.—Mr. J. Lord, borough engineer.

ST. ANNES-ON-THE-SEA.—July 22nd.—For making up certain streets, for the urban district council.—The Surveyor.

SOUTHAMPTON.—July 22nd.—For works of slab paving, for the corporation.—Borough Engineer.

BECKENHAM.—July 22nd.—For the supply of binding materials for Wickham-road, Hayes-road and Thesiger-road, for the urban district council.—Mr. F. Stevens, clerk.

SOUTHALL-NORWOOD.—July 23rd.—For works of paving, channelling and kerbing, for the urban district council.—Mr. R. Brown, engineer and surveyor.

EALING. — July 23rd. — For making up private gardens, Warwick-place, and back alleys of the West Elers estate, for the corporation.—Mr. Geo. E. Brydges, town clerk.

HORNSEY.—July 23rd.—For making up a thoroughfare, for the corporation.—Mr. E. J. Lovegrove, borough engineer and surveyor.

NEATH.—July 23rd.—For supplies of granite or syenite and limestone metalling, for the corporation. —Mr. D. M. Jenkins, borough engineer.

EALING.—July 23rd.—For laying about 8,850 super. yds. of tarred slag macadam and other works, for the corporation.—Mr. Geo. E. Brydges, town clerk.

BURNLEY.—July 27th.—For the execution of a road improvement, for the rural district council.—Mr. H. Pritchard, surveyor.

WITHAM.—July 29th.—For the use per day of steam roller and scarifier, for the urban district council.—Mr. W. P. Perkins, surveyor.

WITHAM.—July 29th.—For the supply of granite, for the urban district council.—Mr. W. P. Perkins, surveyor.

NEW SARUM.—July 29th.—For works of making up, for the corporation.—Mr. Francis Hodding, clerk.

CHESTER-LE-STREET.—July 29th.—For the construction of a new road, for the rural and urban councils.—Mr. W. Ayton, highway surveyor.

SALISBURY.—July 29th.—For making-up work, for the corporation.—Mr. W. J. Goodwin, city engineer and surveyor.

Sanitary.

LUTON.—July 13th.—For the removal of household refuse, for the rural district council.—Mr. W. Austin, clerk.

FINCHLEY.—July 15th.—For the construction of four clinker sewage filters, for the urban district council.—Mr. E. H. Lister, clerk.

NEW ROMNEY.—July 15th.—For alterations to outfall sewer, for the commissioners.—Mr. H. W. Stringer, clerk, New Romney.

CHURCH.—July 15th.—For the construction of a main sewer, for the urban district council.—Mr. W. E. Wood, surveyor.

KEIGHLEY.—July 15th.—For surface-water drainage, channelling, and sewers extension, for the rural district council.—Mr. J. N. Clarkson, clerk.

GOSFORTH.—July 16th.—For cleansing ashpits, for the urban district council.—Mr. R. Sheriton Holmes, clerk.

HAYES (Middlesex).—July 16th.—For laying 1,400 yds. of cast-iron rising main, and steel tube compressed-air main, for the urban district council.—Mr. D. C. Fidler, engineer.

TIPTON.—July 16th.—For the construction of sewerage, for the urban district council.—Mr. W. H. Jukes, engineer and surveyor.

TEWKESBURY.—July 15th.—For the supply of two cow-tea ventilation shafts, for the corporation.—Borough Surveyor.

UPTON-ON-SEVERN.—July 20th.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. G. H. T. Foster, clerk.

MILFORD.—July 20th.—For scavenging work, for the corporation.—Mr. T. Aneuryn Rees, clerk.

ST. LEONARDS.—July 22nd.—For laying stoneware pipe sewer, for the corporation.—Mr. P. H. Palmer, borough engineer.

NORWICH.—July 22nd.—For the removal and disposal of nightsoil, ashes and other refuse, for the corporation.—Mr. A. H. Miller, town clerk.

SWINTON. — July 24th. — For supplying six sprinklers for percolating filters, and media, for the urban district council.—Mr. H. Entwisle, surveyor.

RUNCORN.—July 24th.—For the removal of nightsoil, for the rural district council.—Mr. Geo. F. Ashton, clerk.

GOOLE.—July 29th.—For the construction of 4 miles of sewers formed with stoneware and cast-iron pipes, concrete tubes and brickwork, pumping station, screen and suction tanks, engine-house, pumping machinery, cast-iron main, and other works, for the urban district council.—Mr. Robert Tyson, clerk.

NOTTINGHAM.—July 29th.—For the supply of sanitary fittings at schools, for the corporation.—Mr. F. B. Lewis, city architect, Guildhall.

BATH.—July 29th.—For the construction of iron and stoneware intercepting sewers, for the corporation.—City Surveyor.

MIDSOMER NORTON.—July 31st.—For the construction of stoneware pipe sewers, for the urban district council.—Mr. C. H. Sunderland, surveyor.

Stores.

KING'S LYNN.—July 15th.—For the supply of 500 tons of coal (hand-picked hards), for the corporation. —Borough Surveyor and Waterworks Engineer.

WHITEHAVEN.—July 22nd.—For the supply of iron castings, wrought iron, ironmongery, cement, brushes, brooms and timber, for the Harbour Commissioners.—Mr. John Tyson, clerk.

Miscellaneous.

LEEDS (Roundhay and Seacroft).—July 16th.—For the supply of 1,600 cub. yds. of broken steel slag, suitable as filtering medium, for the rural district council.—Mr. J. H. Ford, clerk.

LEEDS.—July 16th.—For the hire of horses and carts, for the corporation.—Mr. W. T. Lancashire, city engineer.

ACTON.—July 16th.—For the supply of six large refuse carts, and a steam motor tractor capable of drawing a 10-ton load, for the urban district council. —The Clerk.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

BIRKENHEAD.—Accepted for flagging, paving, channelling and sewering, for the corporation.—Mr. J. Fearnley:—
W. H. Ratcliffe, Birkenhead.—Passage Mersey-road, and Bedford-place, £146; passage Mersey-road, £20; passage Willowbank-road and Stuart-road, £70.
R. & J. Evans, Seacombe.—Passage Laird-street, Milner-street, &c., £128.
F. Ireland, Tranmere.—Passage Greenbank-road, South-road, &c., £79.

BUSHEY.—For making up a street, for the urban district council.—Mr. E. E. Ryder, engineer:—

Free & Sons, Maidenhead	£491
G. Jaggard, Bushey	480
P. P. Bliss, Bushey	439
W. Bailey & Sons, Bushey *	416

Engineer's estimate, £421.

COSELEY.—Accepted for the erection of a council school, for the Education Committee:—
S. Pugh, Sutton Coldfield, £2,156.

DEVONPORT.—For making up a road, for the corporation.—Mr. J. F. Burns, borough surveyor:—
Making up of carriageway and footways in Elphinstone-road.

J. Shaddock, Plymouth	£557
T. Shaddock, Plymouth	416
Pethick Brothers, Plymouth	403
J. H. Stone, Plymouth	384
C. L. Duke, Plymouth *	326

FINSBURY.—For the erection of a house for the schoolkeeper on the Baltic-street school site, and the adaption of the schoolkeeper's old house as a housewifery centre, for the London County Council:—

T. W. Heath & Sons, Cromwell-road	£1,708
Lenn Thornton & Co., Camden Town	1,658
McLaughlin & Harvey, Limited, Brecknock-road	1,649
Woodward & Co., Finsbury	1,597
J. Garrett & Son, Balham-hill	1,594
H. & E. Lea, Brewer-street	1,563
W. F. Blay, Limited, Cannon-street	1,489
L. H. & R. Roberts, Islington	1,434
C. P. Roberts & Co., Limited, Dalston †	1,324

Architect's estimate, £1,375.

HIPPERHOLME.—For the supply of macadam, for the urban district council.—Mr. G. W. Thompson, engineer and surveyor:—
T. Feather, Mirfield. 12s. 9d. per ton.
Bold Venture Lime Company, Limited, Clitheroe.—6s. 3d. per ton; 5s. 9d. per ton.
Penmaenmawr and Welsh Granite Company, Limited, Penmaenmawr.—12s. per ton; 11s. 3d. per ton.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. JULY 19, 1912. No. 1,070.

Minutes of Proceedings.

The Design of Masonry Dams.

The paper on Masonry Reservoir Dams read at the annual meeting of the Institution of Municipal and County Engineers by Mr. F. C. Uren, Surveyor to the Aldershot Urban District Council, is a striking example of the fact that it is possible to write a very short paper on a very big subject in a manner which is satisfactory as regards the matter actually dealt with, and is at the same time suggestive of the issues which have to be faced in a deeper study of the subject. Mr. Uren dealt only with the design of the typical profile of the mass gravity dam, and explained briefly three formulæ—those of Sir Guildford Molesworth, Dr. Brightmore, and Colonel Pennycuick—and he put forward some simple rules which he himself regards as sufficient to ensure the design of a reasonable section. In comparing Mr. Uren's designs with the sections found for a dam of the same height by the Molesworth and Brightmore formulas, it is apparent that while there is some saving of material in both cases by Mr. Uren's method, either of the other formulas would give us a better start for the design of a dam of considerably greater depth. A serious objection to all these methods is that, since they do not take into account differences of specific gravity—that is, the actual specific gravity in a given case—they cannot be used for the design of the section of dam of such height that the exact specific gravity is a matter of importance. Dr. Brightmore's formula does take the specific gravity into account, but only, as Mr. Uren shows, to a small extent, whereas it is, however small its effect, an all-pervading element in the design. It is an important advantage of the mathematical formula that it maintains a definite relation between the theory and the dimension at any depth. For depths considerably over 150 feet the amount of the offset on the upstream side is a matter of much importance, though it depends not only on the theory but upon the lowest water-level, or silt-level, in the future reservoir. The proper slope for the downstream face cannot be determined by any set of considerations generally applicable within even a moderate range of variations in the local conditions and the nature of the materials.

We will not do Mr. Uren the injustice of bringing up specific matters which *might* have been included in his admirably lucid paper, the scope of which is strictly defined; but we may direct attention to the important work in the field of dam design with plain masonry, some of the results of which were put before the Concrete Institute in a paper read by Mr. Reginald Ryves, ASSOC.M.INST.C.E. (see THE SURVEYOR, March 22nd, 1912), and in an article which he contributed to the *Engineer* in February, 1911, before the engineering public generally. Mr. Ryves' investigation of precedents and principles as applying to dams of great height and length, and his type design for a dam of arches 200 ft. high, or with suitable materials 300 ft. high, clear of the rock, should not be missed by any engineer who wants to keep in touch with the development of this important subject.

Generally, Mr. Uren's paper suggests that, although, as he points out, "both the theorist and the practical engineer have their proper place in the design and execution" of masonry dams, an important work of this kind should be, from inception to completion, under the direction of a competent consulting engineer. The best of such men are, unfortunately, liable to be belied, because the theorists think them too "practical" to be sound in theory, and the practical men regard them as too "theoretical" to be sound in practice. It is difficult to please all parties.

Methods for Differentiating Soils for Sewage Purification.

A brief description of the sewage farms in this country where sewage purification by treatment on land has proved a failure would fill a very large volume, and if it were possible to ascertain the total amount of money which has been spent in the past upon such failures, it would probably reach an enormous sum. The original error appears to have been due to the assumption that, because certain kinds of soil were capable of properly purifying a certain volume of sewage of a certain strength, any kind of soil would do the same. At the present time the general trend of opinion seems to be towards the other extreme, and it is seldom that any land is now considered suitable for dealing with crude sewage, even of a purely domestic character. At no time does the question of the suitability of any particular kind of soil ever appear to have been considered upon a proper scientific basis. Methods of "rule of thumb" and "trial and error" led to failure in the past, and it is quite possible that it is a mistake to go to the other extreme as we are doing at present. Dr. G. J. Fowler and Mr. W. Clifford have thus conferred a benefit upon engineers and surveyors by showing how the various kinds of soil can be differentiated in respect to their suitability for the purification of sewage. In their paper which was read at the annual summer meeting of the Association of Managers of Sewage Disposal Works, and which we print on another page, they describe and illustrate the very simple apparatus they have designed for the purpose of ascertaining the porosity of any particular kind of soil under varying conditions and of measuring the volume contraction of different soils. They also describe a number of tests which have been made with these appliances, and the results given in tabular form deserve careful study.

Not the least valuable feature of the apparatus in question is that it is extremely simple and easily prepared at very little cost by any ordinary mechanic working under the instructions of an engineer. The authors rightly insist that further investigation on these lines is needed, and that physical data should be obtained and collected with regard to soils which possess a known capacity for filtering and purifying sewage, for purposes of comparison. Now that means for carrying out such investigations upon a proper scientific basis are available, it is to be hoped that a large number of surveyors and sewage works managers will take advantage of the opportunity to obtain the necessary data with regard to the soil on their own sewage works, and if to these results they will add the volume and an analysis of the sewage or sewage effluent which can be satisfactorily purified by each separate plot of ground which is tested, a valuable set of figures will be accumulated for future comparison. From the few tests already made by the authors we note that peaty soils were shown to be less porous than clayey soils, and this to some extent justifies the conclusions of the Royal Commission on Sewage Disposal, in which they classify these two types of soil as equally unsuitable for the purification of sewage. These methods of examination may even prove useful to managers of existing sewage farms by enabling them to compare the various methods in use of working and irrigating the land, and altogether we consider that the authors deserve much credit for the excellent manner in which they have approached the subject and for the time and attention they have devoted to the investigations, and the Association of Managers of Sewage Disposal Works are to be congratulated on having been so fortunate as to have secured such an important and valuable paper for their meeting.

A Dangerous Turning and an Important Improvement.

A very important highway improvement has been carried out at Dorking, where the T road which is the meeting place of the London and Reigate roads with the east end of Dorking High-street has been widened out by the removal of a building, which has allowed of the making of a fair curve joining the London and Reigate roads, and at the same time permits of more space for the far larger amount of traffic round the other corner. This traffic consists mainly of three elements—the local traffic generally, which is well distributed; the traffic to and from the London and Brighton railway station, which is of course concentrated about the times when important trains are due; and, in addition to these, a fairly heavy through traffic, well distributed as regards delivery vans and merchant vehicles generally, but concentrated to a steady stream of motor-cars and motor-cycles at certain times—on Saturdays and Sundays, and more especially during holiday seasons. Since the boundary of the road at this corner is a high wall with no margin of safety of any kind, the turning is (or rather was) a dangerous one, the danger having been removed by the erection of a lamp-post and small island, with a notice board directing the drivers of vehicles to "Keep to the left" of the island when taking the right-hand turning from the London road into Dorking. Mr. W. A. Clegg, surveyor to the urban district council, is to be congratulated on having succeeded in placing this lamp-post and refuge at the first attempt in exactly the right spot. There is no interference whatever with other traffic, and the result of this important improvement is that vehicles turning from the London road into Dorking swing out to a position where they can be seen plainly from both the other roads, and can enter the end of Dorking High-street at a flat angle instead of coming round a blind corner. The only further improvements that suggest themselves are that the lantern should be provided with ground-glass panes, so that no beam of direct light is thrown along the London or Reigate roads, and with clear glass panes opposite to the walls which bound the space, and these walls should, if possible, be kept whitewashed. This, however, is a matter that will not be of importance till the days get shorter.

A Thin Carpet Layer of Bitumen and Sand.

Up to the present time three kinds of paving have been used for city streets in this country on the carpeting system, the wearing layer being in all cases laid upon a strength crust of concrete. In the case of asphalt the carpet layer provides no additional resistance to the shocks of traffic, but accommodates itself to local disturbance of the crust better than stone setts and wood blocks. The "mass" of the wood blocks, and still more of the stone setts, and the greater or less efficiency of the joints in spreading shocks and loads over a number of the blocks, are factors which have some value, though it is now understood that the concrete crust should in itself have sufficient strength for the heaviest loads. In any case, the depth of the wearing carpet must be sufficient to prevent the blocks from being shaken loose, and the quantity of material put down is therefore considerably in excess of that which is actually worn away.

In the case of a bituminous layer used for a street the thickness may be sufficient to provide strength in addition to that of the sub-crust or concrete foundation; or, on the other hand, the wearing layer may be treated as a true carpet layer, and be put down on a concrete strength crust of ample thickness. This method seems to offer special advantages for residential streets with very little traffic, and our readers will find in our issue of November 10th, 1911, some account of such pavements as laid down in Ann Arbor, Michigan. The kind of street on which a bituminous carpet is most likely to be successful is one provided with good shade trees and flanked by side footways and gardens. We note, however, that at Ann Arbor this kind of paving is now being used on "main streets and alleys," and the results will be awaited with interest. The concrete crust is usually 6 inches thick, and the carpet layer is made with sand and tar, or sand and a prepared "bitumen," being only $\frac{1}{4}$ inch or $\frac{3}{8}$ inch thick. Such a carpet is not likely to be efficient in streets with any considerable traffic, but it should be noted that it may prove cheap and reasonably efficient where it is intended to go on using the concrete surface after the carpet has worn away, and so long as the concrete remains tarry enough to prevent the development of the hard smoothness of the concrete itself. It may be suggested that where it is tried for streets with traffic the method will develop into the provision of a roughish concrete crust tar-painted and sanded from time to time. The concrete roads of Mayne County, Michigan, have in some cases been treated in this way.

Institution of Municipal and County Engineers: The Annual Meeting.

Inasmuch as our last issue appeared on the day following the opening of the annual meeting of the Institution of Municipal and County Engineers, it is evident that any observations which we then made had to be confined to the bare contents of the annual report which had been printed and circulated, and the address of Mr. R. J. Thomas, M.INST.C.E., the new president, an advance copy of which had been courteously supplied to us. Now that the meeting is *un fait accompli*, it is our pleasant duty to congratulate Mr. Thomas on a very successful inauguration of his term of office. The character of the speeches which were made by the proposer and supporters of the vote of thanks which was unanimously and enthusiastically accorded to Mr. Greatorex, the retiring president, clearly shows that the vote was not merely a formal one. Members appeared anxious to voice their keen appreciation of the yeoman service which Mr. Greatorex has rendered the Institution during

his strenuous year of office as its official head. The past year may truly be described as a record one from many points of view. The inauguration of the new constitution, the visit to Paris, and the establishment of the Mutual Defence Fund are some of the outstanding features. The ex-president's untiring zeal and energy certainly stand out as an example which his successors will find it no easy matter to follow. Personal attendance at eleven out of twelve district meetings, and the devotion of no fewer than forty days to the business of the Institution are services which thoroughly merit the gratitude which was so heartily expressed in the vote of thanks.

We have already commented on the matters which are specificially dealt with in the annual report of the council, and we only desire to add a word now in regard to the criticisms which were made in the course of the discussion which ensued on the motion for its adoption. Such criticisms are, in our view, to be encouraged so long as they are not brought forward in any carping spirit. Sound criticism indeed is necessary if the highest degree of efficiency is to be attained. But we agree with the observation of Mr. Willis that the real keynote of the discussion was that the members—while speaking their minds freely and fully—should give thorough and ungrudging support to the council for the time being in office. The meeting showed that the Institution is thoroughly alive, and we cordially wish Mr. Thomas as successful a year of office as that which was enjoyed by his predecessor.

Dangerous Tramway Poles.

An important and rather peculiar case, having special interest for local authorities and tramway engineers, was recently decided at the Newcastle Assizes. It appears that in one of the roads leading into the city the tramway has side poles for a certain distance only, the remainder of the route being worked with centre standards. One night a motorist driving into the city collided with the first of these centre poles, and he sued the corporation for the damages he sustained through their alleged negligence in leaving the standard in a dangerous position and unlighted. It was urged on behalf of the defendants that the Board of Trade had passed the route as safe, that the pole was sufficiently lighted by the ordinary street lamps, and that the plaintiff drove carelessly. The jury, however, found for the plaintiff, who recovered substantial damages.

We call the attention of our readers to this case because it once more impresses upon tramway authorities that their common law liabilities are not in any way affected by their special privileges. It should be remembered that as a general rule the grant of the privilege to encumber the highway with dangerous electric apparatus imposes a corresponding duty not to injure persons lawfully on the highway, and to make the highway substantially as safe for them as it was before. The plea that the apparatus has been erected in pursuance of statutory powers only avails in the absence of negligence, and it has always been held that a man who suffers damage owing to the *negligent* exercise of statutory powers has a right of action. In the Newcastle case the abrupt change from side to centre poles without adequate warning was held to be negligent on the part of the corporation, and the jury were further of opinion that the plaintiff was not guilty of contributory negligence in carelessly driving the car. Hence the success of the plaintiff, which should be noted as a warning by other tramway authorities who may be similarly situated.

Newcastle City Engineer's Report.

The report of Mr. W. J. Steele, the city engineer of Newcastle, on the work of his department for the year ended March 31, 1912, is a record of considerable activity and steady progress. Among the many matters of interest with which it deals we may mention the opinion which Mr. Steele expresses that the land required for the provision of back streets would in most cases be put to much better use if it formed part of the open space at the rear of the houses. Of course, some kind of secondary means of access is necessary, but we agree that this can usually be sufficiently and conveniently provided by means of passages if the number of houses in a terrace is limited. It is interesting, too, to notice that the Local Government Board have sanctioned the preparation of a scheme under the Housing, Town Planning, &c., Act, 1909, for the Crag Hall Dene area, while a further scheme to deal with an area of 1,540 acres on the eastern side of the city is under consideration by the committee. The report shows very satisfactory statistics in regard to such matters as highway maintenance and refuse disposal. With regard to snow removal, however, it is pointed out that it is impossible to make anything like an accurate provision for this service in the annual estimates—a difficulty which will be appreciated by every municipal engineer. We have pleasure in publishing in another column some extracts from the report, dealing with the most generally interesting matters.

* * *

Asphalt-Macadam.

In an article which appears on another page Mr. Cecil Nathan leads up to an advocacy of asphalt as a binder for broken-stone roads, and makes an interesting comparison between the penetration and mixing methods. Asphalt-bound macadam was the subject of a paper presented to the Irish Road Congress last year (see our issue of April 28th, 1911), and with reference to this paper the following sentence appeared in our last special annual issue:—"The idea may require some development in practice, as the possible effect of the asphalt in holding the stones too rigidly, with resulting slipperiness, seems to have been overlooked." In addition, it may be pointed out that in order to avail ourselves of the resiliency of the asphalt there must be some body of that material in the crust. If, as Mr. Nathan proposes, the crust be made with the minimum of voids, where is the body of asphalt capable of giving effect to the property of resiliency? We by no means hold the opinion that asphalt is not in the running as a binder for broken-stone roads, but much more than familiarity with the material itself is necessary in order to apply it successfully in the making of road crusts, and in this matter a knowledge of chemistry is not so important as a competent knowledge of physics.

"Much food is in the tillage of the poor: but there is that is destroyed for want of judgment."

* * *

The Waste of Water.

The recollection of the drought of last summer, and the ever-present possibility of the recurrence of a period of abnormally dry weather, serve to emphasise the importance of using every available means to guard against any waste of the public water supplies. A great step in the right direction was taken a few years ago, when the Incorporated Joint Committee on Water Regulations was formed. This committee issued a model code as long ago as 1908. Up to the present, however, the Local Government Board, while fully recognising the value of the work of the committee, have not seen their way clear to sanction the adoption of the model code by those water authorities who are dependent upon the sanction of the Board for their regulations. The code has, however, been adopted by many authorities who do not require the sanction of the Board, and signs are not wanting that some arrangement may be come to whereby the objections of that body to the model code may be removed. We are convinced that the best line of progress is in the direction of securing uniformity of practice, and that in this way the evils of waste, misuse and contamination will best be overcome.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

To meet the exigencies of time and space we were compelled last week to give an abbreviated report of the discussion on the report and statement of accounts at the annual meeting of the institution. This week we are enabled to do fuller justice to the matter.

DISCUSSION OF ANNUAL REPORT.

The Chairman (Mr. A. D. Greatorex) said he proposed to add nothing. He moved that the report be received and approved.

Mr. W. H. Prescott (Tottenham) seconded. He would like to say he had a very decided sympathy with the general scope and object of the recommendation with reference to the Mutual Defence Fund. The scheme for the establishment of a fund came before the members for the first time, though a long overdue proposal, and he was glad indeed that an energetic and determined step was at last being taken as a counterstroke against the scandal of the unjust treatment of members in the honourable discharge of their public duties. He ventured with some amount of confidence to lay down the principle that the healthy vitality of an institution such as this was not to be estimated by the mere number of its members, but chiefly on account of the protection it was prepared to give to any members who found themselves, by libellous or slanderous imputation, being wrongfully dismissed, or subject to other unjust treatment. On previous occasions he had not hesitated to criticise in a friendly way the work of the council, but so far as this proposal was concerned, it must be accounted a conspicuous part of the good work done during the past twelve months, and he congratulated Mr. Greatorex and his colleagues on having taken such an important step. He thought it ought to be made clear that the setting up of this question of a defence fund did not mean that the subject of superannuation and security of tenure would be thrown into a secondary place. Those were undoubtedly the questions of all questions, and he was quite sure from what he knew of them that every member of the council would continue to toil for the consummation of such worthy objects. There was, of course, no use blinking the fact that there were tremendous difficulties in the way, and for the moment he could not see how they could be effectually overcome. Powerful obstacles were interposed against these reforms being achieved in municipal service, and that was why the defence fund was being set up, and he trusted it would receive the support of every member of the institution.

Mr. T. Henry (East Retford) was glad to hear from the last speaker that superannuation and security of tenure were not to be thrown into the background by the establishment of the defence fund. They had waited very long for superannuation and security of tenure, and they had occasionally worked—more often than they ought—under very great hardship arising from the want of these objects. Only recently the case had occurred in connection with a large Midland town of a rural surveyor being deprived of office with poor compensation. Instead of being based upon twelve years' service, this should have been based upon the whole of his service. He hoped Mr. Scorgie would continue to pursue the objects which he had in view in reference to this matter. Mr. Scorgie stated in his report that one of the greatest difficulties they had to contend with was to educate their employers—the authorities—to realise that the officer would not alone benefit by a proper scheme of national superannuation. In regard to that he (the speaker) would say it was surprising how things differed. It might be so with regard to London authorities, but he might say that a member of his own council with whom he was conversing was astounded to think he was not entitled to superannuation and compensation as others were. It appeared, therefore, that intelligence with respect to the matter was not so much needed in the provinces as elsewhere. Probably the feeling on this question was never more forcibly expressed than in a letter written by the late town clerk of Nottingham, in which he said: "There is a more insistent cry year after year for the municipality to undertake wider work, while those who are most urgent in this demand are those who cry out most loudly about the salaries paid to the men who are entrusted with the work they deem most important to the public weal. At election times the streets ring with abuse of officials who are receiving certainly no more than, if as much as, they would gain for equal efforts in private affairs. The anxieties of official life, the constant strain, the feeling that a well-earned income is grudged by many of those who think they pay it, make the position of an official difficult indeed. For me it is intolerable, and I prefer to take the chances of, as it were, beginning life again to continuing in a career where my health was being seriously affected." When an important official like the town clerk of Nottingham wrote a letter like that, it behoved every one of them to use all their efforts to obtain superannuation, and the more difficult object of security of tenure, and he therefore trusted that Mr. Scorgie would continue to do everything in his power to attain the desired end.

Mr. C. Vawser (East Barnet) said he accepted the invitation to raise several points in the report. According to the last report the institution had a membership of 1,257, and this year the number was 1 360. This was undoubtedly a flattering increase, but he wished to call attention to the fact that, according to the latest records of the institution, the members represented only 639 public authorities, and from the figures given in the official Directory for 1910 there were still 1,441 authorities unrepresented. Many officials holding these 1,441 appointments were undoubtedly valuable men in the profession, and would be valuable assets as members of the institution, and he trusted that now the new council had come into being they would seek to make increased efforts to add to the membership, and thus enhance the value of the institution. The next question he had to refer to was the question of the examination. The report of the council once more pressed upon members the desirability of acquiring the testamur of the institution, or an equivalent examination granted by a representative body. It was to be regretted that such a recommendation was not carried out. Why did not the council ask public authorities when vacancies arose to consider the question of the examination?

The Chairman stated that during the last twelve months the council sent to every authority that advertised, or before they advertised, informing them of the examination, and asking the council to consider the question.

Mr. Vawser: Then there was the question of the new offices. The council said they were looking out for premises. It was a great pity the council could not find better official accommodation, because the country members when they came to town would like to make appointments at the headquarters of the institution. The present state of things was a disgrace. He thought everybody would sympathise with the cases of hardship mentioned in the report. Persecution was the correct word to use to describe these when the antagonism of individual members of a council was exercised against an official for no reason whatever. He had been particularly asked to call attention to the council "book." According to the Articles of Association the institution was established for the improvement of the professional status of the members, and to assist in enforcing their rights and interests. That did not limit them to taking up the defence fund, and he would call attention to clause 4, where it stated that no money should be paid either as dividend or bonus by way of profit to any member of the institution. He would venture to suggest that the defence fund was not a matter of profit within the Articles of Association, and there were many who did not see eye to eye with the solicitor on that point. It was stated in the report that, "on the motion of Mr. A. D. Greatorex, the council recently referred the matter (the formation of a defence fund) to the chairmen of their Standing Committees, and it was to be hoped that a scheme would shortly be placed before the members for their approval and adoption." This was but recent action, but he could turn up correspondence to prove that this matter was in the air twenty years ago. He knew of the case of a member of the council whose application for assistance was disregarded, and such things, he contended, brought the institution into ill repute. He said this with the

greatest regret. The members in the Eastern District had returned two members with a mandate to see that these things were carried through, to insist that the council should take them into their confidence, and to report when they met with no success. In the report of Mr. Scorgie it was stated that, "in the surveyors' section (of the N.A.L.G.O.) the professional side is not touched, but an examination for clerks in engineers' and surveyors' departments is held." Now, he would like to say that if the National Association of Local Government Officers was for local government officers, why was not the question put of their own certificate being pushed forward? Again, Mr. Scorgie reported that the National Association was not lacking "in efforts to bring about legislation embodying a system of deferred pay for municipal officers." He (Mr. Vawser) was very pleased to hear this. Mr. Scorgie further on said that rapid strides had been made in making an appeal for treating local government officers like other public servants as regarded superannuation, and further that the association had been successful in enlisting the sympathy of the County Councils' Association and the Urban District Councils' Association, and was now in negotiation with the Association of Municipal Corporations. That was all very well, but where was the support of the council of this association? So far as they were concerned they did not report any progress whatever. Then, as regarded security of tenure, that was undoubtedly a question that was full of difficulties, as so many of the public appointments under municipal authorities were made during the council's pleasure. He would have no fault to find with them if the council would take up the defence fund to do away with persecution, for when that was done they practically had security of tenure. They were told that the report of the National Association dealt with large objects, but they did not want objects, but benefits. They were also told that the association had always been of great assistance to a large number of officers in tendering advice. Why should the funds of this institution be used by another authority in giving legal assistance and not used by themselves? They could give money to other associations, it appeared, yet they could not vote money direct to what they themselves said was a most deserving cause.

Mr. W. H. Grieves (Sutton, Surrey) said the remarks of the last speaker showed that the members were already beginning to take an interest in the affairs of the institution under the new constitution. His particular reason for rising was to voice a little complaint he had with regard to the district in which he had the honour to be—*viz.*, the South-Eastern District. They in his district had not yet had so far a meeting of any description called for the purpose of considering the appointment of district chairman and district representatives, or district secretary. He understood that the object of the new constitution was that the district members should be called together in order that they might discuss the question of these appointments as well as general questions that the council had to deal with. To his surprise, in March last he received a long letter signed by his friend Mr. Maybury—he did not know whether that gentleman was present—stating that he had been asked to set the matter in motion, and, incidentally, that at a meeting of the Kent surveyors at Maidstone he put the question of the appointments on the agenda, when it was decided that the honours of the offices should be divided between Surrey, Kent, and Sussex. His complaint was that the Kent surveyors took upon themselves the duties that ought to have been divided between the three counties without asking the other counties to co-operate in the selection. He had no fault to find with the selection made—in fact, he thought a better selection could not have been made; what he complained of was that one county had, he was going to say the audacity, but he did not want to use strong language, to take upon itself the choice of the representatives of the whole three counties. He thought he was right in his contention; certainly he did not think it was fair that such a thing should occur. He noticed that some correspondence had appeared in the technical journals in regard to this matter. He felt inclined to take part in it, but he did not particularly like correspondence in papers concerning the affairs of the institution, and he made up his mind that the constitutional course was to mention the matter at that meeting. He was not at all satisfied with what had been done. Since then there had been no meeting of the district at all. (Voices: "Why?") Why? There was no reason why there should not have been.

A Member: Why should not you?

Mr. Grieves said he did not understand the interruption.

A Member: It is your district.

Mr. Grieves: But he was not in a position to call the district together. He was complaining that no meeting had been called in order that they might discuss the subject. He also resented this sort of procedure. Mr. Maybury might have meant right—probably he did—no doubt he did; but it was not the right way to go about it. He did not give the other counties any opportunity of making suggestions from their own side. If the Surrey and Kent counties had been called together there would have been no cause for complaint, and it would have prevented a member sending out a circular asking that he might be supported in the election. That, he thought, was undignified, and ought not to be. Mr. Maybury's letter alluded to the "apathy of the present council." He did not share he feelings expressed with respect to the apathy of the present council, as he thought the council had made rapid strides since last these questions were talked about. He thought the district members ought to be consulted, that meetings should be called and everyone have an opportunity of discussing the whole matter.

Mr. A. E. Prescott (Eastbourne) remarked that he was somewhat responsible for the correspondence in the technical journals alluded to by the last speaker, and he did not mind saying he should do the same thing again, because the members of the South-Eastern District were not treated fairly in the matter. There was a meeting convened. ("No, no.") Well, if there was not, there ought to have been. They had an association, and it seemed to him the duty of the association to issue instructions so that a representative meeting should be held in the Southern District, in order to give members the opportunity of discussing the business of the suggested representatives. He thought that what had taken place was most unfair. He had nothing whatever to say with regard to the representatives adopted; he believed they would give very good service; what he would like to urge was as to whether instructions were given to organise meetings in the district, and whether instructions were given to write the members to attend, and, if so, why they were not carried out. The members of the South-Eastern District were anxious to work amicably, and he had no doubt that if a satisfactory explanation was forthcoming nothing further would be said. He was sorry Mr. Maybury was not present, as an explanation had been asked for and had not been forthcoming.

Mr. E. Willis (Chiswick) said he rose to bless rather than to curse. Personally he thought the council were to be congratulated on the strong report they had produced. It was full of matter, and he still thought that a lot of the complaints would disappear in course of time. He did not think that complaints were quite deserved at quite so early a stage. He thought there had been mistakes made with regard to the district committees, but it was rather hard to blame the council for them. They (the council) had done a large amount of work, and he felt that the members should support them, and not take too strong an attitude at this juncture. Attention was drawn in the report to the question of the younger members of the association, and this was a question that could not be urged too strictly on the attention of members. They ought to have their pupils and assistants members of the association, because he saw that a number of the junior members were joining another institution, which, although it might have a laudable object, was not so representative as this institution. Unless they were going to amalgamate—and there were numerous difficulties in the way—he thought that this young blood going away would be a loss to the institution. With respect to superannuation and security of tenure, it was not an easy matter, and it was not fair to blame the council with the implication that it was. Last year he had the opportunity of fighting for it, and they did obtain it, and he thought the whole of the kingdom would obtain it before another five or six years passed by. Security of tenure was a much more difficult problem, and although they obtained the support—in the case he alluded to—of every member of the council, and it went forward for the chief officers, the Local Government Board would not give them a hearing. They declared it was not possible to consider, and that it was not likely to be considered. The chairman of the council and the chairmen of committees were present at the Parliamentary Committee, but

they would not hear a word of evidence upon security of tenure, and personally he foresaw serious difficulties in obtaining it, and if they did get it it was not going to be all lavender. They might rely upon it that under such a scheme an official who got into hot water would have to get out of it on his own accord. The Mutual Defence Fund, they might be sure, had his support, and as regarded the Orphan Fund, he was delighted to see it was pushing ahead. He would not remind the members that there was such a fund in connection with the institution. The annual meeting was held that morning, but only a few members were able to be present owing to the early hour at which it took place. It was mentioned that thirteen cases had been dealt with last year, and relieved substantially, and also that £100 had been added to the reserve fund. He thought this was a splendid position to obtain in a period of eleven years. Every year they had been doing more work, and he asked the members to support the fund, even if they only gave 1s. a year. With respect to the representation made to the council by the association of which he had the honour to be president as to further powers being conferred upon local authorities to define the routes of heavy motor traffic, he appreciated the fact that the council gave the matter their closest consideration, and that, in fact, they gave him quite a long hearing, but he still thought that the local authorities of the busier towns should have the power to define the routes of motor traffic. The damage these vehicles did to water-bound macadam roads was immense, and increased the cost of the highways to a great extent. He did not want to bar the use of the motor omnibus—it was no doubt the traffic of the future—but he thought it was proper the local authority should have a veto upon the vehicles going down residential roads, as they emptied the houses and did a great deal of damage.

Mr. G. W. Lacey (Oswestry) said that no doubt one had a certain amount of sympathy with the remarks made as to the district meetings, but it was the exception rather than the rule to call the members together. It was not done in his district, nor, he believed, in many other cases. As a matter of fact, there had been official difficulties which would not exist in the future, for practically there had been no secretaries or other officers to act. It might have been possible for the council in starting the new arrangement to call the members together, but in the absence of chairman or secretary it appeared to him it was almost an impossible thing to do other than had been done. With officials now appointed in the various districts the sort of thing described was not likely to happen again, and the members would have the opportunity of meeting together for the re-election of their officers. In calling attention to the expenditure account, he would remark that he did not know whether it was the first time in the history of the institution that an adverse balance had been shown. The amount spent on printing was £792, an increase of nearly £100, which did not seem to be accounted for by the increased numbers or the printing itself. Perhaps the chief reason for the adverse balance was the expenditure on the conference volume—he presumed so, at any rate. He should like to know whether it was true that the expenditure entailed on the Town Planning Conference volume was likely to result in a profit, as if so they might perchance look forward to a balance on the right side.

Mr. H. T. Wakelam (Middlesex) thought Mr. Willis had struck the keynote of the discussion when he said "Support the council." Some time ago it was his privilege to attend the annual meeting of the Thames Valley Association, when a great deal was said on the subject that had been discussed that day (the defence fund), and it was that meeting that prompted the letters over his signature in the professional papers. The result appeared to be good, because of the many who at once responded and sent contributions. He was not aware at that time that the council of the institution had taken up the matter, and it was only on attending a meeting of the council he was made acquainted with the fact. The president said: "I see you are taking an active interest in the defence fund: the council are also considering the question." He at once replied: "Then I will hand over the letters and contributions I have received to the council." This he did. He was asked by a member of the institution to publish the names of the supporters who had been good enough to send contributions, but this was obviously impossible, for he could not without their consent publish their names in the professional journals. He agreed with the remarks of Mr. Prescott on the subject, and would add that the text of the meeting should be: "Support the council." It was his intention to support them all he could, and do everything he could to help forward the matter on the council. On the question of paving, it should be stated that the Local Government Board gave loans of ten years for creosoted soft wood, five years for non-creosoted. They gave twenty for concrete, which made the repayment of the principal and interest much smaller for that kind of paving. He trusted, in conclusion, that the president would have a successful term of office during the forthcoming twelve months.

Mr. W. Harpur (Cardiff) pointed out, with respect to the discussion on the subject of the district meetings, that as a matter of fact the district committees did not come into active operation until that day, and any meetings held before then were not properly constituted in any sense. There might have been informal meetings—he had had one in his own district which he took upon himself to call—but they were quite informal. He was pleased to hear what Mr. Willis had said with regard to the Orphan Fund, and he would like to add a word to his appeal for more subscriptions. The committee of the fund had done very good work, but with more funds they could, of course, do more, and they hoped in the future to do more. He would earnestly appeal for more subscriptions, however small, for that commendable object. The defence fund was another object to which they could not devote too much attention. It was not a right thing that a member of that institution, or a member of their profession who was not in the institution, should be attacked and not able to defend himself—that they should not be in a position to do something to help. He trusted this would be pushed forward, and that something would be done to help members to defend themselves against scurrilous remarks and attacks by taking such action as might be necessary.

Mr. T. S. Picton (Eccles) wished to support the council for their admirable report. He desired to point out that their respected friend Mr. Brodie had been elected a district representative as well as being a member of the council, and to inquire whether he could hold both positions. As to the remarks of Mr. Prescott and Mr. Grieves, he did not see where they came in, as the members had the papers given them to vote upon, and the membership of the district was therefore according to the wish of the majority of the district. He noticed from the asset side of the accounts that there was a sum of £220 representing subscriptions in arrear. He took it that all municipal officers had a good banking account at their back. (Laughter.) If not, they ought to have. When May came round they ought to notify their bank managers to send on the cheque due to the institution, and in return the secretary would forward a little slip which would make their heart glad, because they would not have their subscription to the institution in arrear.

The Chairman said that before putting the resolution to the meeting he should like to say, as regarded the question put by Mr. Lacey, that the increase in the expenditure for printing was due to the fact that there had been a great deal of printing during the twelve months on account of the alteration of title and the change of the constitution. This had added considerably to the expenditure under that head, and they hoped it would not occur again. He ought to have stated, in moving the adoption of the report, that the final stage in applying to the court had been reached, and that the change of title had been granted; therefore every step in connection with that matter had now been completed. Mr. Harpur had referred to the question of the district committees, and said they did not come into operation until this annual meeting. He (the chairman) intended to mention that. He was sorry Mr. Grieves and others had complaints as to holding informal meetings. He could assure them that every step taken by the council or their officers was properly taken. The district secretaries were asked to hold informal meetings to arrange for the formal meeting, and were supplied with envelopes to summon every member. There were three districts which had no secretaries. He wrote to certain members of the council and asked them to call informal meetings in their areas, and supplied them with envelopes. Some little misunderstanding must have taken place, otherwise there would have been no chance of complaint that was to say, if his instructions had been carried out to the letter. He took it now that

the matter had been ventilated the complaint was entirely done with. The new district committees would meet as soon as possible after this meeting and everyone would work for the benefit of the institution as a whole. Some reference was made by Mr. Picton to subscriptions in arrear. He could assure that gentleman that the Finance Committee had made every effort to reduce the arrears, and they had, in fact, done a considerable amount of work in that direction during last year. He regretted that certain members of the institution could not see their way to pay their subscriptions when they were due. It caused the secretary an immense amount of trouble, and added to the expense of the work. He hoped the hint would be taken, and that in the future the arrears would die out. With respect to the question about the North-Western District, the matter would be dealt with, and Mr. Brodie would have to decide which seat he would occupy.

AN ATTACK ON SURVEYORS.

The Chairman said another matter had been brought before the council, and he had been asked to move a resolution with respect to it at this meeting. They were probably all acquainted with it. It consisted of a nastily-written letter which appeared in one of the professional papers in June dealing with the integrity of surveyors. The council felt they could not allow the matter to go by, or allow this meeting to pass without referring to it, and passing a strong resolution on it. He begged therefore to move, "That the members of the Institution of Municipal and County Engineers now assembled at their annual meeting strongly resent the imputations contained in a letter appearing in June which gravely reflected upon the integrity of municipal surveyors and surveyors in general."

A Member said he would rather that the name of the writer was given.

The Chairman: There is no objection to that, but it was thought better to leave it out.

Mr. W. H. Prescott (Tottenham) seconded. He thought it just as well to make it clear that the writer was a man holding a responsible position who supplied stone-breaking machines to various municipalities. The letter appeared on June 19th, and a more scurrilous and pernicious letter he certainly never read. It contained imputations in express terms upon the integrity and uprightness of municipal engineers as a collective body. Unfortunately the publication was not actionable, as the writer had been careful not to make a specific charge against an individual. Road makers were charged with being bribed by accepting inferior road materials. As they knew, several well-known municipal engineers, all members, had found it necessary to bring actions to clear themselves of libellous imputations upon their character. In every case the charges had utterly failed. There were the cases of Mr. Chambers-Smith, Mr. Essex, and Mr. Jones, of Colwyn Bay. The case of the last-named gentleman was particularly hard, because after pursuing him with unscrupulous mendacity the man libelled, and Mr. Jones had to pay his own costs. They ought to see that he was not a loser of the £250 to which his costs amounted. It appeared to him (Mr. Prescott) that if they could pay money to a local government officers' fund they could contribute something towards the costs of Mr. Jones. Libel and slander were punishable, both civilly and criminally, and if he had anything to do with the Mutual Defence Fund, to which reference had been made that morning, he should be a strong advocate for proceeding by criminal information if there was a doubt of the financial stability of the defendant.

Mr. W. Nisbet Blair (St. Pancras) said it should be understood when the technical Press was mentioned that all the technical papers did not publish this letter. The particular passages in the letter to which Mr. Prescott had referred had been expunged from the other journals, who had thus treated them honourably and fairly, while publishing as much as was useful of the letter.

The resolution was then put and carried unanimously, it being agreed to insert the name of the writer of the letter and the journal in which it appeared.

The annual report and balance-sheet were then adopted.

VOTES OF THANKS.

Mr. J. S. Brodie (Blackpool) next moved, "That the best thanks of the meeting be given to Mr. A. D. Greatorex for his management of the affairs of the institution and his conduct in the chair during the past year." It had been his pleasure, he said, during the past twelve months to meet their president on many occasions, and he must say, with all possible respect to his distinguished predecessors, he considered he came second to none in strenuous devotion to his duty. He found upon inquiry that he had been as far away as Stirling in the North, while he had also been to the East, West, and South, attending meetings with that assiduity which they could only regard as phenomenal on his part. It was therefore with the greatest confidence that he (Mr. Brodie) proposed this resolution to the meeting, and he felt sure it would be passed with the heartiest acclamation.

Mr. W. Harpur (Cardiff) said he had pleasure in seconding the proposition. They knew their president had been a demon for work. He had been here, there, and everywhere, and whatever could be done for the institution had been done by Mr. Greatorex during the past year. He did not think it was possible for a president to be more diligent than theirs had been, or to take more interest in the affairs of the institution than he had done. It was therefore with the greatest pleasure he seconded the resolution.

Sir John Lemon (Southampton) remarked that he should like to support the proposition. He had known Mr. Greatorex for several years, and he had been very pleased to notice the splendid way in which he had carried out the duties of the office from which he retired that day. Out of twelve district meetings he had attended eleven, the only occasion upon which he was absent being when he attended the funeral of Mr. Eayrs. During the year he had devoted about forty days to the business of the institution, and he had been fortunate in having the support of a very good council. He (Sir John) did not know what would happen in some towns if the surveyor gave so much of his time as Mr. Greatorex had given to the institution—he feared there would be a vacancy in the office of borough surveyor. They were specially indebted to Mr. Greatorex because last year happened to be one of the most active in the history of the institution. There had been the negotiations with respect to the institution itself, the Road Congress, the visit to Paris, and other important matters dealt with, making Mr. Greatorex's tenure of office a record one.

A Member remarked that, years ago, when he did his little in connection with the institution as secretary for Yorkshire, he knew their worthy president, and he was delighted to find that he had had such a grand year of office.

Mr. T. W. A. Hayward (Battersea) also supported the resolution, observing that nobody could have entered more heartily into the work of the institution than Mr. Greatorex. At the same time he thought it was right that they should convey to Mrs. Greatorex their appreciation of the great interest she had taken in the institution.

Mr. C. Jones (Ealing) could not—should he say?—dishonour himself by sitting quiet under such circumstances as these. Circumstances had prevented him from taking part in the meetings, but he could endorse everything that had been said because he knew Mr. Greatorex well. He could recall, as a predecessor of Mr. Greatorex, sitting with Sir James Lemon and four others at the formation of their institution. He was glad to be able to say these few words as one deeply interested not only in the prosperity of the institution, but also in the work done by their president.

The President-Elect (Mr. R. J. Thomas) remarked that he was proud indeed that it was his duty to put this resolution, which had been supported by their honoured founder and by others, of thanks to Mr. Greatorex for the admirable service he had rendered to the institution. Those who had the pleasure of going to Paris under the guidance of Mr. Greatorex would never forget as long as they lived the round of work that gentleman put them to. He (the speaker) did not think there ever had been a party of municipal engineers which got through such an enormous amount of work as was got through by those who pioneered them safely through the intricacies of Paris.

The proposition, including an expression of thanks to Mrs. Greatorex, was carried by acclamation.

Mr. Greatorex, who was cheered on rising, returned thanks, and said that the last year had been to him one of pleasure and delight, so much so that he felt a certain amount of regret that it was up. If he had done anything of interest or value to the institution he would be quite well satisfied with the time he had given to it. He was one of those who believed that

if a man took an office of this kind he should do the best he could in the discharge of its duties; and he might add that he had always had a very keen interest in this institution from the day he became a member. He was hoping to see a great increase of its members and its prosperity. He had also to thank the speakers for the kind way in which they had referred to his wife. It was quite true that he had rather, he was afraid, neglected his home in attending to the business of the institution during the past few months; as a matter of fact he had had only one Saturday at home in twelve weeks. Still he could assure them his wife took a very great interest in the work of the institution, and she was quite as pleased and delighted as anybody when he became president, and it had been her wish that he should do everything possible for the benefit of the institution and his duty as president. As regarded his council, when he informed his committee he was elected president he was asked what it meant, and he told them it meant doing the usual business of the institution. He was there and then granted leave to attend the council and district meetings whenever it was necessary during his year of office. He did not think there had been any cause of complaint, because his work had gone on just the same, any arrears having been made up by a little night work. His council were delighted he was elected president, and pleased his year of office had been so successful. He should always look back to that year as one of the happiest in his life. Every member of the council and every member of the institution, the officers—the secretary and assistant secretary—had assisted him in making his presidency a success, and having passed the chair he could assure them his interest in the institution would continue to be quite as keen and quite as good in the future as it had been in the past.

After the new president had delivered his address,

Mr. W. Nisbet Blair (St. Pancras) moved that the best thanks of the institution be given to Mr. Thomas for the address. There was, he said, very much in the address with which they were all in full sympathy. The presidential address was not a subject to be debated, which was almost a pity, because so many things had been stated in this address that might prove useful for discussion. The president had referred to a matter which touched them—*viz.*, the increased cost of maintenance of highways in recent years, and the desirability of obtaining a contribution from road users, such as the promoters of trackless tramways and the owners of motor-omnibuses. The address also dealt with a matter that deserved consideration—*viz.*, the facility with which loans were obtained for work which might not live for the period that the loan continued. His (Mr. Blair's) council were convinced of the mistake of that years ago, and they had taken up no loans for paving since 1900, everything being paid out of revenue. He should emphasise the importance of that question to the members of the institution.

Mr. G. W. Lacey (Oswestry) seconded the vote of thanks. He felt it was a great honour that such an important duty had not, as in the past, been placed in the hands of the aristocracy of the institution—a term which he used with the greatest respect, because they all admired the aristocracy—but in the hands of the democracy. As Sir James Lemon rightly remarked, the past year had been a hard and difficult one for the past-president, but, thanks to his geniality and *bonhomie*, and the amount of energy he possessed, their new president would be prepared for hard work, and prove himself, like his predecessor, a popular chief officer. Their eulogiums upon the presidential address, he was proud to say, had always been merited, and he would content himself with saying that they admired the address of Mr. Thomas, and wished him health and strength to carry out his duties, feeling sure this would be well done, and that he would earn their best thanks for the service he would render to the institution.

The President remarked, in reply, that the preparation of a presidential address was a matter of difficulty because one liked to avoid, if possible, repeating what other presidents had said. When they recollected that there were thirty-eight presidential addresses to refer to, and one did refer to them, it was very difficult to avoid saying what had been already stated in those addresses. He was very much obliged to them for the vote of thanks. He was afraid his address was a very ordinary thing, but one did one's best. With reference to Mr. Lacey's good wishes, he could assure them that there was nothing nearer to his heart than the good of the institution, and that he should do everything he could to promote it. He would remind them of the notice placed upon the pianoforte in the Far West—"Please don't shoot the pianist, he is doing his best!" (Laughter.) He added that a number of letters of apology for non-attendance had been received from, among others, Mr. Barber and Mr. J. A. Brodie. They congratulated the last-named gentleman heartily upon the great honour conferred upon him, and through him upon them, and the confidence placed in him by His Majesty in asking him to take part in the important work at Delhi. They were glad to find he had returned to England, but they knew that necessarily a great deal of work had accumulated during his absence, and that he could not leave Liverpool until he had overtaken a lot of it. Letters had also been received from Messrs. S. S. Platt (Rochdale), T. H. Yabbicom (Bristol), P. H. Palmer (Hastings), H. E. Stilgoe (Birmingham), and Mr. H. P. Maybury (Kent), who was suffering from asthma.

In the afternoon the members proceeded to the consideration of papers, the first to be submitted being:

MASONRY RESERVOIR DAMS: A SIMPLE FORMULA FOR THEIR DESIGN.

By F. C. Uren,
Surveyor, Aldershot Urban District Council.

Mr. Uren is a Constitutional Irishman, was trained for the profession under the late Mr. G. H. Small, Borough surveyor of Penzance, later on acting under him the position of deputy borough surveyor. He then filled assistant's posts at Wrexham and Oxford. In 1900 he was appointed surveyor to the Ely County Council, and in 1904 to his present position. The subject of Mr. Uren's paper is a favourite one with him, as indeed are all matters relating to works of water supply, for he has specialised in this direction for some years. He has had Parliamentary, company, as well as private work experience, and the works with which he has been connected include the sinking of boreholes, artesian, tube, and deep wells, upland reservation and pumping schemes, and the formation of earthen dams, storage and service reservoirs, and water towers. Mr. Uren is a member of the Institution of Civil Engineers (Dublin), and his paper read recently before that body, in which he dealt with earthen, compound and masonry dams, giving an account of some failures, was considered the best paper submitted during that session, with the result that he was awarded the Maguire Silver Medal. In the following year he again contributed to the same body a paper entitled Mains and Pumping Gas and Water Installations. He also possesses the diploma of the Royal Sanitary Institute for Local Surveyors, and is a Licentiate of the Royal Institute of British Architects.

The author has chosen this subject more on account of its intrinsic interest than its novelty, for while a good deal has already been written on the subject and a number of exhaustive and interesting papers have been submitted from time to time, yet, as our experience increases in the design of such structures, we find the subject still retaining its absorbing hold alike upon the academical and the practical engineer.

Every failure gives the mathematician fresh opportunity for further investigation and the propounding of additional theories. The recent disaster at Austin, Pa., is a case in point, and we have as many as four fresh brochures in less than a month as a consequence.

Both the theorist and the practical engineer have their proper place in the design and execution of these important works. Before the practice of the latter can, however, be utilised, it is essential that we should have some framework to base our design upon; so that the solution of the problem must rest in the first place with the mathematician. Then the work of practical men would indicate such alterations as

previous experience and the circumstances of the case may suggest.

The result is a typical design which practical experience accommodates to any given set of variations from the premises in the typical case.

So far as the mathematical side of the question is concerned, however, the author ventures to suggest that engineering is a little overdone with very complicated and elaborate formulæ, and in the course of this paper he will endeavour to show that intricate

FIG. 1.—CHARTRAIN DAM.

calculations for the design of masonry dams are unnecessary.

To the French engineers, Messrs. Sazilly, Graeffe and Delocre, is due the honour of having first discovered the exact method of designing the typical dam. Prior to their investigations, the factors which influenced the dimensions of large dams were somewhat imperfectly known, and all those which had been built were trapezoidal in section. They had been designed to fulfil the condition that their moment of resistance to overturning should be two, three or four times the resultant moment of the forces, tending to overturn them. For a dam to overturn, however, the resultant pressure at the face would have to pass through the edge of the base, and long before that pressure could reach that point the toe of the dam would begin to crush; and in many cases (notably those in Spain) the dams were crushed by the enormous weight of masonry injudiciously placed.

The theory of Graeffe and Delocre was merely the application of mechanical principles to determine a form of dam in which the crushing pressure should not exceed proper limits on the down-stream face when the reservoir was full, and on the up-stream face when the reservoir was empty.

Their methods of calculation, while extremely laborious and involving incidentally such exercises as the solution of equations of the sixth degree, led to a form of dam more economical of material than the trapezoidal form previously adopted—that required, indeed, but one-half of the masonry. To prove that they did not merely deal with theory they erected from the formulæ they expounded several dams which quite startled the engineering world by their boldness; among them were the well-known dams of Ban, Chartrain, De la Terrasse, and the Furens, the latter of which the author saw in 1909 in the Gouffre d'Enfer, near St. Etienne. Compared with the Gileppe dam, near Verviers, which had a section two and a-half times as large as it need have had, it was remarkably watertight. There was no leakage on the outside, although the dam had to sustain a head of water 150 ft. high.

Following Sazilly and Delocre came Sir Guildford Molesworth, who undertook to devise some simpler formulæ, which would give an approximation to the results of the French engineers. His formula, which is of great value, gives results in accordance with that important condition laid down by eminent mathe-

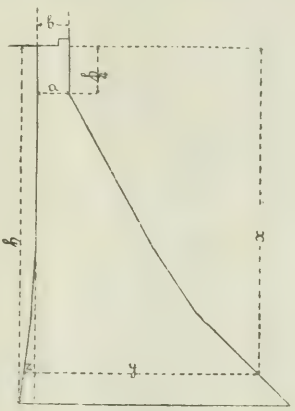

FIG. 2.

maticians and engineers as essential in all structures of this kind—that there should be no tension in the dam—and this law necessitates the resultant pressure reservoir full and empty falling within the middle third of the section.

The formulæ is now well known, and is:—

H = height of dam in feet.
x = any depth below surface of water in feet.
y = offset from vertical line to outer face in feet $= 0{\cdot}6x$ as a minimum.

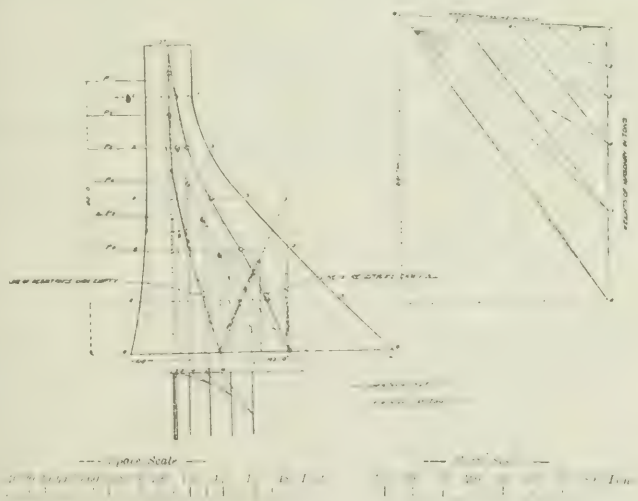

FIG. 3.

z = offset from vertical line to inner face in feet.
b = width of dam at top in feet.
a = width of dam at $\frac{1}{4}H$ from top in feet.
P = limit of pressure on masonry in tons per square feet.

If y as given by the formula be less than $0{\cdot}6x$, it must be increased to $0{\cdot}6x$.

$$\eta = \sqrt{\frac{0{\cdot}05\,r^2}{1^2 + (0{\cdot}03\,r)^2}} \cdot \left(\frac{0{\cdot}09\,r}{1^2}\right)$$

. Assuming the case of a dam 180 ft. high, and divided by four imaginary planes, built of masonry weighing

145·6 lb. per cubic foot, and with a permissible limit of stress equal to 20,000 lb. per square foot, the section obtained by graphic statics is shown in Fig. 2. Whether full or empty, it will be seen that the resultant falls well within the middle third of the thickness of the dam at each place.

Since Messrs. Graeffe and Delocre investigated the problem, at least thirty high masonry dams have been built, and among those there were only two, as far as the author knows, in which Molesworth's form

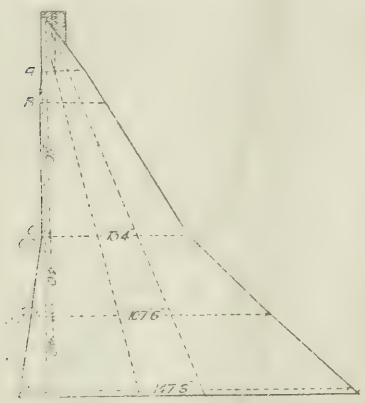

Fig. 4.

was widely departed from. The first of these was the Gileppe dam already mentioned, which had a section at least two and a-half times as large as it need have had; the other was the well-known Vyrnwy dam, which also had a section considerably greater than a purely rational section.

Another excellent formula that does not involve high mathematics which should appeal to engineers is that propounded by Dr. Brightmore:—

$$s = \sqrt{\frac{wh^3}{x}\left(1 + \frac{w^2h^2}{4W^2}\right)}$$

where

w is the breadth at a depth h below the crest

W is the weight of masonry above h, and of the water over the inner face;

w is the weight of unit volume of water, and x is the maximum stress allowable in the dam.

This formula gives the breadth at any depth in terms of that depth, and of W. At first sight it would

Fig. 5.

appear that the presence of the latter factor would render the formula useless, but examination shows that the term containing W is small compared with the first term of the formula in fact it ranges from one-fifth to one-eighth of the other expression between the depths 100 ft. and 190 ft., so that if W is roughly approximated to, the breadth can be found to a sufficient degree of accuracy. From the tendency of this term to become a factor of safety it can be considered successive laminæ, the breadths are simply calculated; and by taking moments about the inner third of the breadth, the projection at the inner face is deduced without either finding the centre of gravity of the dam or of the water over its inner face. The method of calculation, it will be seen from the diagram, applies, with the data given, to a dam up to 190 ft. high."

The conditions upon which the above solution is based are:—

(*a*) A maximum compressive stress on any plane not exceeding in intensity from 6 to 12 tons per square foot.

(*b*) Absence of tension at any point.

(*c*) A greater resistance to shearing than the total horizontal thrust of water.

When the author first wrote upon this subject (see "Transactions Institution of Civil Engineers," Dublin, vol. xxxvi.) he was somewhat sceptical about the necessity for the resultant falling within the middle third, and consequently was far from fixing the condition that there should be no tension anywhere at the faces of the dam.

Any considerable deviation of the line of pressure, reservoir full, from the middle third was undoubtedly a danger, but a sight departure, he thought, would not be inconsistent with good practice, for Rankine had only said "that the line of resistance should be within but a small distance beyond the middle third of the wall."

At that time he preferred the formulæ prepared by

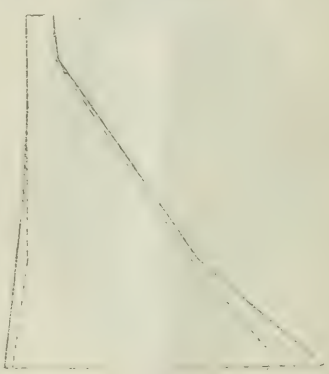

Fig. 6.

Author's Design ————
Dr. Brightmore's Section - - - - - -

[illegible] Crouch, Periyar Dam, C.S.I., M.I.C.E., who designed and executed the great Periyar dam, the highest masonry dam yet constructed. His formulæ are appended:—

In Fig. 5,

$$y = 0{\cdot}37\sqrt{\frac{\frac{1}{2}s^2 + \frac{1}{2}d(s-d)}{p}}$$

p being the limit of pressure in feet of water, or

$$y = 7{\cdot}67\sqrt{\frac{\frac{1}{2}s^2 + \frac{1}{2}d(s-d)}{p}}$$

p being in pounds on the square foot.

If d is greater than $\frac{s}{2}$, $\frac{s}{2}$ should be substituted for d in the formula which then becomes

$$y = 1{\cdot}17\sqrt{\frac{s^2}{p}}$$

or

$$y = 9{\cdot}25\sqrt{\frac{s^2}{p}}$$

according as p is in feet of water or in pounds on the square foot.

It is not easy to give a satisfactory formula for the slope to be used upon the limit of pressure to be allowed, as it is not until a depth of 1200 that any limit likely to be adopted in practice comes into play at all.

Molesworth's formula $s = \frac{1}{10}y$ gives an excessive amount of material at depths of 1500 and under. A vertical face for the first 100 ft., a slope of 1 in 20 for the next 40 ft., 1 in 10 for the third, and so on, increasing one hundredth at every 100 ft., gave satisfactory results within all practical limits.

Later experience and considerations however have

convinced the author that the real danger of failure in a dam built of proper materials on a suitable foundation does not lie in the danger of crushing of the materials (the resistance of which is far greater than had been supposed), but in that of percolation or shearing, and that the dimensions sufficient to guard against these two dangers will amply suffice to meet that of crushing, so that elaborate calculations of the resistance to the latter are waste of labour.

If the following simple rules are observed by those

FIG. 7.

Author's Design ——— ———
Molesworth's Design .....

designing a masonry dam nothing more is really needed, for they will be found to give results so nearly accurate that they may be adopted without risk of error:—

(1) Under no circumstances whatever should there be any risk of tension on either face.

(2) That the total area of the section at any depth x should not be less than $\frac{x^2}{3}$; of course, for convenience of construction and resistance to shocks, it must not be much more than this in the upper part.

(3) That $y = \frac{1}{10}x$ up to 100 ft. in depth, and over 100 ft. $y = \frac{1}{4} \times x^{\frac{1}{2}}$.

(4) z to be calculated as already mentioned—*i.e.*, a vertical face from 0 to 40; 1 in 20 from 40 to 80; 1 in 10 from 80 to 120; $\frac{x}{20}$ from 120, 160, and so on.

Comparisons between the results obtained from the other formulæ given in the paper, and the very simple

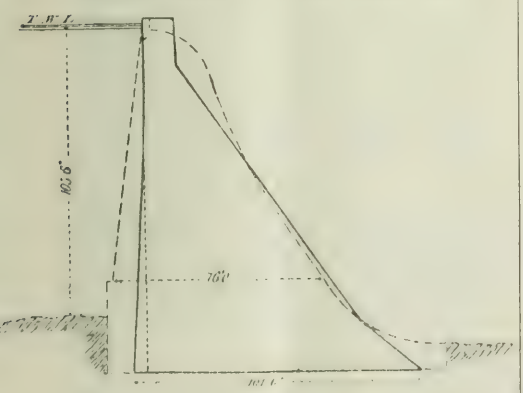

FIG. 8.

Author's Design
Mr. Mansergh's Design for Elan Dam .....

one advocated in rule 3 above may be seen upon reference to the accompanying diagrams, Figs. 6, 7 and 8, for dam 160 ft. in height.

Masonry dams are, of course, very costly, as compared with earth embankments where the latter would cost £100,000, that of a similar dam in masonry would be about £250,000 but they are indispensable where risk of failure must be avoided at all costs. Probably the attention of engineers in designing dams in cases where economy is a matter of prime importance will be more and more directed to those which are curved in plan. Many such have been built of recent years, especially in New South Wales, where considerable economy of cross-section has been obtained by horizontal curvature. In these cases, however, the whole dam has been on one curve, with its abutments secured in the rocky sides of the gorge or valley where the water is impounded. Another and very interesting form of construction is that advocated and carried out with success by Captain A. H. Garrett, R.E., and also (independently) by M. Gaudard, of Lausanne, where the dam consists of a series of horizontal arches abutting against horizontal piers, long enough and strong enough to resist water pressure. This form of design may be said to represent the last word, so far, that science has had to say on the subject, though the application of reinforced concrete may possibly introduce still greater economy. Dams of this nature have been constructed in other countries, but all the reinforced dams constructed up to the present of which the highest the author could find was 65 ft.—had been, so far as he was aware, for power purposes, and not for waterworks.

DISCUSSION OF MR. UREN'S PAPER.

Mr. A. P. I. COTTERILL (Westminster) said the subject was somewhat academical, as there might not be many in the room called upon to design dams. He thought the author would be the first to admit that in designing dams one must have regard to particular constructions which were not very clearly alluded to in the paper. The author dealt with formulæ which he boiled down into four simple rules, but there were other considerations which might upset the rules. He referred to such things as foundations, the materials available, the site, the danger that might attend some forms of construction owing to buildings or villages being below the dam—such, for instance, as they had in the case of the Derby dam, where one of the residences of the Duke of Norfolk was below it. Then there was the question of trouble from flood water. All these things might make some difference apart from the rules. Then it was not possible to say that there never would be any tension in masonry dams. Consider the case of a somewhat yielding foundation. That would get up stress which the mathematical designer could not foresee; or, again, if the soil on which the dam was founded was different in character in one place from what it was in another—soft, say, in one part, and rocky in another—stresses were set up which were outside the designer's calculations. The late Sir Benjamin Baker, a great authority on masonry dams, talked of them as "elastic solids," implying that changes might go on apart from the mass moving. Sir Benjamin got out a model by means of which he showed how slight changes might take place in the structure, and he also held that they must design not only for much heavier compressive stresses than the author mentioned of 9 tons to the square foot, but also be ready for a tensile stress of 10 tons per square foot. At the Croton dam the pressure ran up to 14 or 15 tons to the square foot. Looking through these four simple rules, he had dealt with rule 1. Rule 2 seemed involved in rule 3, which looked like an old rule they would find in any old edition of Molesworth. As to curved dams, no doubt more could be done in that direction, though they must remember that there must be a limit in the radius. Anything outside a radius of 400 ft. made a curve ineffective, and a curved dam was then to all intents and purposes the same as a straight one. As to the suggestion of horizontal arches with deep piers, that was a direction in which progress could be made, but it was not new. He remembered that a former president of the institution designed a retaining wall on these lines to keep back a slip on the hillside near Bristol, and it had been very effective. With regard to reinforced concrete improvement and changes were certain to take place; in fact, there would be constant progress. The field was an enticing one, and he only hoped those who were entering on it would be increasingly successful.

Mr. E. J. ELFORD (Southend-on-Sea), who proposed a vote of thanks to Mr. Uren, said it might not fall to the lot of any of their members to design dams, but none the less a paper of this kind in their Transactions must be useful for reference, especially as the principles of design observed in a dam of the kind described would apply to other structures of a similar character. He suggested, however, that rule 1 would not be applicable to concrete structures. In

L

reinforced concrete work it was usual to allow for the tensile strength of the concrete. He had recently been carrying out some important works, and samples of the concrete had been taken at frequent intervals. Only in a single instance had they got a lower tensile stress than 200 lb. after eight weeks. That showed they could not ignore the very valuable quality which concrete possessed.

Mr. J. Julian (Cambridge), who seconded, said the subject was one of great interest, but in practice possibly it would be found that one could not afford the time without the use of amplified formulæ. In rule 3 he thought it would be desirable to substitute 110 ft. in depth for 100 ft.

The President remarked that they had to exercise extraordinary care in designs of this character, bearing in mind the terrible results which were liable to accrue in case of failure. They had instances of this kind in American practice, as they all knew. In English practice they would no doubt all exercise their national caution, and their error, if there was any error at all, would be on the safe side.

The vote of thanks having been passed,

Mr. Uren, in reply, said he appreciated the kind reception accorded to his paper. As this was his first appearance in a *rôle* of this character, he naturally felt considerable diffidence in submitting his theories to so many eminent practical men. It was true that these theories were based upon considerable personal observation, but it was one thing to hold theories and quite another to flaunt them before a critical engineering audience. With regard to Mr. Cotterill's remarks, to have gone fully into those points would have required a more elaborate paper than he had submitted, but he had satisfied himself that the formulæ he had submitted did provide for the points he had raised. It provided, among other things, for ordinary defects of workmanship, the varying quality of stone and cement, and something for differences of temperature arising out of the construction of such massive works all the year round. He thought he might claim that the formulæ were simple, and in cases where the safety of property and life was involved, as was generally the case in valleys below high dams, all the points Mr. Cotterill had raised should be provided for. Mr. Elford took up a position which was practically his own when he first wrote on the subject—that there should be some allowance for tension in all concrete work. To-day he took a different standpoint. He said that the formulæ should be such as to allow for no tension at all in a masonry dam. If they erred at all, they should err on the safe side in an important matter of this character. He would like to say, in conclusion, how desirable it was there should be a standard system of symbolical notation. One engineer employed x for dimension, another employed z. The result was endless confusion, and a waste of considerable time was involved.

Mr. Uren has since amplified his reply as follows: "I scarcely know what reply to make to Mr. Cotterill's remarks, because I am in entire agreement with what he says, and it is because I do agree with him that I submit the equation in its present form, for it allows for most of those contingencies he would provide for. As regards the foundation, however, influencing the design, only judgment or practical experience can decide that; formula would have no bearing in the question at all. No engineer, I imagine, would build a masonry dam upon anything but sound rock; shale, for example, would be unsuitable for any but earthen dams."

(Table continued.)

ANNUAL DINNER.

There was a large gathering, including many ladies, at the Hotel Cecil on Thursday night, when the annual dinner of the institution took place under the chairmanship of the president, Mr. R. J. Thomas, M.Inst.C.E., upon whose right hand was Mrs. Greatorex, wife of the retiring president. The toast of "The King" was proposed from the chair, and

Mr. E. Purnell Hooley gave "The Imperial Forces," and alluded to the possible formation of a technical force in case of need. He believed the War Office were still considering the matter.

Major Otway, in reply observed that engineers of municipalities and counties would of all people be most valuable for an army if it was called upon to take the field, and he felt sure they would be ready to give their services. Without scientific support their army would be like a clock without works—it would not go at all. All the scientific sections—bridging, telegraphy, railways, and "wireless"—required scientific direction.

Alderman Arthur Vernon gave "The Institution of Municipal and County Engineers," and said this was an age of competition and combination—the voice of one was like a voice crying in the wilderness—and their institution, like others, had brought wonders to the notice of the public. It was established in 1873, a year before Lord Beaconsfield proclaimed the doctrine "Sanitas sanitatum omne sanitas," which had produced one of the greatest revolutions in this country. It had resulted in a great saving of life in the last century, and it was to be hoped this saving would be still greater in the coming century under the auspices of this institution. In his experience he had come across three classes of municipal surveyors, one an admirable man who used to get into trouble—as all surveyors did—and who was in the habit of meeting attacks by long observations which were not understood; another, also an admirable man and conscientious, but too sensitive; and yet another, who was still carrying on his work, who said little or nothing, did everything, was always ready, and took trouble with everything. The result was that he was perfectly happy, he enjoyed an enormous amount of esteem, and was satisfied, except, perhaps, on the question of salary. He did not include their president in any of those classes, for he was a class unto himself. If he enjoyed only a small share of the satisfaction which his employers enjoyed, he had much to be thankful for. He was an amiable autocrat who, while making nice suggestions to the committees, invariably did whatever he liked. (Laughter.) In conclusion, he trusted that prosperity might attend the institution in the future even in greater measure than it had in the past.

The President, in response, said he was proud to know that Alderman Vernon had a high opinion of municipal surveyors. These (the surveyors) were undoubtedly doing their best to serve the authorities who employed them, and it was only by the co-operation of gentlemen like Alderman Vernon, who had ability and time, and who devoted a large portion of their leisure to public work, that they were able to do anything at all. They owed a very deep debt of gratitude to the municipal councils of this country for their disinterested labour on behalf of their fellow-men. They were told that professional men of a good class were not understood. He believed there was a good deal in that, and he quoted in connection therewith a story from the "unlimited depths" of Mr. H. Percy Boulnois's repertory—and might he, at the same time, congratulate the institution upon possessing so admirable a poet laureate, for in two languages he had described effectively the recent excursion he paid to Paris, not forgetting his high "appreciation" of the Paris destructor? Proceeding, the president stated that, as they well knew, the work of the municipal engineer was growing enormously. The area covered by municipal and county engineers was expanding by leaps and bounds and if they compared their present work with that of twenty years ago they would find a vast difference, especially in one particular branch to which he had devoted a portion of his life—road construction. Municipal engineers and surveyors had their difficulties and trials, and these would not be reduced, he was sorry to say, by the National Insurance Act, and he thought they would see the point when he stated that they had, unfortunately, a very large number of their members who obtained very inadequate salaries—below the £160 a year under which the Act applied. He did not know any other profession in the world whose members had more trials, more difficulties, and more temptations than theirs. He was proud to think that they could be looked up to and trusted to do their best well and fearlessly.

An interesting incident next occurred in the presentation by the president of a miniature silver cradle to Mrs. Greatorex as a memento of the birth of her daughter Patricia during her husband's term of office as president of the institution. The president enlarged in felicitous terms upon the charming hospitality extended to the members by Mr. and Mrs. Greatorex, and stated that this was the first occasion in the existence of the institution upon which a "little cherub" had appeared to a president and his wife during the former's tenure of office. The gift, he added, had been subscribed by the members of the council.

Mr. Greatorex feelingly returned thanks for the

presentation, and took occasion to congratulate the members upon the presence of ladies at their annual dinner for the first time. It had been reserved, he said, for a bachelor to cause this agreeable innovation to be made.

Mr. W. H. PRESCOTT (Tottenham) proposed "Kindred Institutions," and remarked that the attitude of other institutions towards theirs had been one of cordiality and goodwill, with the idea that they were all linked together for a common object, with identical interests in all that concerned the welfare of engineers, and all measures aiming at the improvement of the public health.

Dr. UNWIN, president of the Institution of Civil Engineers, acknowledged the toast. The oldest society, he said, that dealt with the application of science to practical affairs was the Institution of Civil Engineers. He regarded the Institution of Municipal and County Engineers with the most benevolent attention, and was glad to welcome the members into the ranks of his own society. He wished them success in the great national work they were engaged in.

Mr. T. W. A. HAYWARD (Battersea) submitted "The Guests." For the first time, he remarked they had the mother of the president at their dinner, and for the first time they had a bachelor for president, and thy would agree with him they had a real good fellow in Mr. Thomas. In coupling the toast with the name of Sir George Gibb, chairman of the Road Board, he expressed a hope that that gentleman would prevail upon his board to spend a little of their money upon the roads of London.

Sir GEORGE GIBB, in response, observed that their institution had attained the maximum of efficiency with the minimum of decay. It had all the force and the influence and power of local government, from which all our government proceeded, and its members represented the skill and the science of engineering, two great powers in the national life—the power of force and the power of skill. This country had the best roads in the world, and although the coming of the motor had introduced conditions which were entirely novel, the Englishman had bravely tackled the problem and had made the roads good. He had been asked to adopt the doctrine of the open purse, but he would remind them that he had to be fair all round, and where the sum was very limited the most had to be made of it.

The toast of "The Ladies" was proposed in an excellent speech by Mr. E. WILLIS, and acknowledged by Mr. J. S. KILLICK, assistant engineer to the Road Board.

Finally, the PRESIDENT proposed "The Official Staff," coupled with the names of Mr. Thomas Cole, secretary, and Mr. H. A. Giles, assistant secretary, both of whom replied.

Selections of music were subsequently given by Miss Edith Evans and Messrs. Ivor Foster, Felix Salmond ('cellist), P. Mavon-Ibbs (piano), and Astley Weaver.

Messrs. C. G. Mason (Guildford) and J. Paton (Plymouth) were among those present at the annual meeting. We regret to find that their names were omitted from the attendance list which appeared in last week's issue.

Roman Roads: Roads Improvement Association Investigations.—A special committee of the Roads Improvement Association is now investigating the whole system of the old Roman roads in this country to decide whether, in view of the facilities now afforded by the Imperial Road Improvement Fund, any action can usefully be taken to bring any of the roads now disused into service again. The stability and thoroughness of construction of the old Roman roads are well known, but during the railway era a number of them became obsolete. It has frequently been suggested that, now that traffic is rapidly returning to the roads, many of the old Roman highways might be made up and utilised for cross-country traffic. Many of these roads have been relieved of their metal by adjoining landowners and others, but it is believed there are still a large number which, although grass covered, retain their old foundations. The Secretary to the Roads Improvement Association (Mr. Wallace E. Riche, Caxton House, Westminster, London, S.W.) would be glad to receive, for the information of the committee, any suggestions from tourists and others who have taken an interest in this matter.

ROYAL INSTITUTE OF PUBLIC HEALTH CONGRESS IN BERLIN.

THE MUNICIPAL ENGINEERING, ARCHITECTURE AND TOWN PLANNING SECTION.

The Congress of the Royal Institute of Public Health, which opens on Thursday next, in Berlin, and extends over three days, will be conducted in five sections, the one of special interest to our readers being that devoted to Municipal Engineering, Architecture and Town Planning—over which Mr. P. C. Cowan, D.SC., M.INST.C.E., chief engineer of the Local Government Board of Ireland, will preside, among the vice-presidents being Prof. Henry Adams, M.INST.C.E., Sir Alexander R. Binnie, M.INST.C.E., Mr. John A. Brodie, M.INST.C.E. (city engineer of Liverpool), Mr. W. B. Bryan, M.INST.C.E. (chief engineer of the Metropolitan Water Board), Mr. A. D. Greatorex, M.INST.C.E. (borough engineer of West Bromwich), Sir James Lemon, M.INST.C.E., Mr. T. de Courcy Meade, M.INST.C.E. (city engineer of Manchester), Prof. W. C. Unwin, F.R.S. (president of the Institution of Civil Engineers), Mr. G. W. Willcocks, C.B., M.INST.C.E. (chief engineer to the Local Government Board), and Sir John Wolfe-Barry, K.C.B., F.R.S. Mr. A. J. Martin, M.INST.C.E., is one of the secretaries of the section.

The papers to be read during the three days on which the section will meet include:—

"Water Supply in London," by W. A. Richardson, ASSOC.M.INST.C.E., assistant engineer to the Metropolitan Water Board.

"British Practice in Sewage Disposal," by A. J. Martin, M.INST.C.E.

"Sewer Ventilation," by T. de Courcy Meade, M.INST.C.E.

"Building By-Laws," by J. D. Casswell.

"Town Planning," by Thos. Adams, town planning assistant to the Local Government Board.

"Legal Aspects of Town Planning," by R. E. Willcocks.

"Use of Reinforced Concrete in Architecture," by Prof. Henry Adams, M.INST.C.E.

"The Use of Reinforced Concrete in Engineering," by J. H. Waller.

Papers dealing with the sewage arrangements of Berlin, water sterilisation and street cleaning will be contributed by German delegates to the congress.

Visits to a large number of public institutions in and around Berlin have been arranged in connection with the gathering.

Shopkeeper's Action against Corporation.—The Municipal Corporation of Christchurch, in its capacity as sanitary authority, was held liable by the Court of Appeal last week to pay £23 compensation to Edith Lingke, a furniture dealer, for having injured her business by obstructing the entrance to her shop by a heap of gravel.

Problems in Engineering.*—This reprint from the popular students' section of our contemporary consists chiefly of questions that have been set at the examinations of the Institution of Civil Engineers and of the Institution of Municipal and County Engineers. There is no index to the work, but the matter is classified under the heads of Mechanics and Hydrostatics, Strength and Elasticity of Materials, Theory of Structures, Surveying and Levelling, Water Supply and Hydraulics, Sewerage, Sewage Disposal, Road Making and Tramways, Building Construction and Materials, Law, and Miscellaneous. This book is calculated to be of considerable use to students in these subjects, but it would have been an advantage if the source of the questions could have been stated. The answers have in general been given rather more fully than would be the case at an examination, with the object of explaining the principles to a student without his having to refer to a text-book for them. The price brings the work within the reach of all students, and there is so much useful matter compressed into a small space that even the best-prepared candidate cannot afford to be without it.—*Sanitary Record.*

* "Problems in Engineering, with Solutions." Being Questions and Answers reprinted from the "Assistants' and Student-" Section of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER. First Series, 1909 to 1911. Edited by Sidney G. Turner, ASSOC.M.INST.C.E. Price 6s. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

Institution of Municipal Engineers.

MEETING AT KESWICK.

From photo by INSTITUTION OF MUNICIPAL ENGINEERS AT KESWICK. *G. P. Abraham, Keswick.*

The annual conference of the Northern District of the Institution of Municipal Engineers was held at Keswick on Saturday, and a most interesting day was spent in the "Metropolis of the Lake District" and its environs. The programme for the day included a visit to the Thirlmere waterworks, on the invitation of the Manchester Corporation, a drive to the top of Dunmail Raise to inspect the new road made by the Cumberland County Council, and a visit on the return journey to Threlkeld granite quarries, on the invitation of the granite company. This is the first time the institution has met as far north as Keswick, but one and all were unanimous in expressing the opinion that the day had been a most enjoyable one.

The conference opened at 10.15 a.m. in the town hall. Mr. J. Davidson (Morpeth) presided, and there were present Messrs. John Robinson (hon. secretary of the Northern District, Darlington), B. Wyand (secretary of the institution, Westminster), W. Finch (county surveyor), D. H. Johnstone and W. H. Baker (Carlisle), P. M. Hope and A. Furness (West Ward, Appleby), Jas. Jardine (town clerk, Morpeth), R. Forster (Alston), F. J. Reilly, S. Grisdale and J. W. Pooley (Cockermouth), W. S. Lythgoe (Penrith), W. Hodgson (Keswick), J. Murray (Longtown), W. Taylor (Kirklinton), W. B. Thomas (Southwick-on-Wear), W. J. Coulson (Cramlington), J. W. Holbrook (Houghton-le-Spring), J. Mole, senr., and J. Mole, junr. (Chester-le-Street), J. T. Pegge (Durham), G. Gregson (Durham), F. Mellor (Newcastle), W. Wallin (Newcastle), J. Harding (Hetton-le-Hole), and G. Symon (Blaydon). Councillors P. Atkinson (chairman), G. P. Abraham and G. Watson represented the Keswick Urban District Council.

When the meeting opened Mr. P. Atkinson (chairman of the Keswick Urban District Council) extended to the delegates, on behalf of the town, a very hearty welcome. He hoped that they would have a pleasant and a profitable time, and that they would go away with recollections of the Lake District that would encourage them to come again.

The Chairman (Mr. J. Davidson) said they were all indebted to the chairman of the Keswick Urban District Council for the kindly welcome extended to them. It was the first meeting the institution had ever held in Cumberland, and, from what they had seen of the neighbourhood so far, he certainly hoped it would not be the last. They were simply delighted with the attractions of the district. They were obliged to the chairman for coming to give them a welcome on a very busy day. They all knew the vast amount of time that was given up to the service of the public on local authorities by the chairmen, and considering the fact that they were mostly business men, with many calls on their time, it was a great credit to them that they should devote so much time to the work. They were all perfectly satisfied with what they had seen so far, and it was almost a sacrilege keeping the members inside with such pleasant drives and so many delightful walks in front of them. He moved that a vote of thanks to the chairman of the Keswick Urban District Council, acknowledging his kindness in coming to give them a welcome, and to the Keswick Urban District Council for allowing them to use that hall, be entered on the minutes.

This motion having been seconded, it was carried with applause.

Mr. P. M. Hope (surveyor to the West Ward Council) then read a paper on "Keswick and its Municipal Undertakings." It was such a model of brevity that it might have been more appropriately headed "Keswick in a Nutshell."

A NOTE ON KESWICK AND ITS MUNICIPAL UNDERTAKINGS.

By P. M. Hope.

Keswick, the Metropolis of the Lake District, is a small but neatly built town standing on the banks of the river Greta, and situate about ½ mile from Lake Derwentwater, "The Queen of the Lakes." It is governed by an urban district council, covers an area of 1,068 acres, and contains 1,093 houses. The present population is 4,403, but this is considerably augmented by visitors during the summer season, notably during the Convention week, when several thousands invade the town. The rateable value is £25,272, and the present debt under the Public Health Acts amounts to £11,505.

As is usual for a town which exists only on account of its natural attractions as a visitors' resort, the local authority have of necessity been very wide awake to bring the sanitary condition obtaining to a very high state of efficiency, and the gravitation water supply obtained from Skiddaw is one of the most constant and pure supplies in England, no restrictions having to be imposed upon any consumers during the long drought of last year. This supply was originally bought from the old Keswick Waterworks Company, and since then a new reservoir, capable of holding 250,000 gallons, has been installed at Millbeck, the engineer of which was James Mansergh, of Westminster, London. The council have in recent years strengthened their position by obtaining a Special Water Act, which empowers them to apply profits from the water towards the reduction of the district rate.

In recent years the council have installed a new sewage disposal works, upon the intermittent filter system, the engineers employed being David Balfour & Sons, Newcastle-on-Tyne. These works are doing the work of purification in a satisfactory manner.

Through the munificence of Messrs. T. & W. Hewitson, the town has a splendidly equipped cottage hospital, and the council have provided a very isolated fever hospital upon Whinlatter, where, I am pleased to say, no death has occurred. A wooden small-pox hospital was also erected during the scare of 1908, but has happily not yet been required for use.

The refuse of the town is collected twice a week, and arrangements have just been concluded for the acquirement of a tip, thus saving the town what at

first appeared to be a capital expenditure of over £1,000 for a two-cell destructor.

The town itself is lit throughout by gas, upon the Bellamy system, the main lamps being served by Keith's compressors. The outskirts of the town are lit by electric light, and the council boasts of having the best lighted town in the North.

There are 3 miles 6 furlongs of county roads in the urban area, kept up by an annual grant from the county council, and 5 miles 2 furlongs of district roads, and the council will in all probability be laying considerable stretches of tar-macadam in the near future in the town.

The Town Planning Act has been found very difficult to carry out in Keswick, on account of the crowding together of the houses of the town, necessitated in olden times by the Border raids, and the council might be criticised for their too literal interpretation of the Act.

The council have been alive to retain for the community those great natural assets which form the attractions to visitors, and when it was mooted that there was a danger of the boat landings at Derwentwater passing into the hands of private enterprise, the council stepped in and secured them for the town, at a perpetual charge of £120 a year, and at present derive as revenue the sum of £180 from this source.

The recreative needs of the visitors have been met by the munificence of Messrs. T. & W. Hewitson, who endowed and presented to the town the two beautiful parks you would note on your way from the station. These are governed by trustees, and provide for cricket, tennis, bowls and croquet, at a very nominal charge, and cost the ratepayers nothing for upkeep.

Keswick exists through its visitors, but, on the other hand, there are several small local industries, such as pencil making, lead mining, granite quarrying, &c., which employ a number of hands, but the one-time staple industry of the town upon which the couplet "God Almighty, grant His aid To Keswick and the woollen trade" was penned has long ceased to exist.

The members of the institution will find that as a visitors' resort Keswick is alive to the necessity of efficient sanitation, and that the urban authority will spare no pains to see that every step is taken to reach this desired end.

At the conclusion of the paper Mr. Robinson asked is the urban council supplied the boats on Derwentwater, and, if not, how did they make such an immense revenue?

Mr. Hope: The boats are put on the lake by permission of the council, and the owners of the boats pay an annual rent of 25s. per boat. The electric launches pay in proportion.

Mr. Wyand proposed a hearty vote of thanks to Mr. Hope for his excellent paper. He had been most commendably brief. It was usual on those occasions to give the number of paving stones in the streets and the gallons of tar used on the roads. Mr. Hope had spared them those details, and had yet given them a concise account of the town.

Mr. J. W. Pooley seconded, and said that what struck him most was that the debt on the town was nearly one half the rateable value. It seemed a lot of money. He complimented Mr. Hope on his brevity but he had made them feel that they would like to have heard a little more. In a place like Keswick, where the town was so alive to the sanitary needs, the water supply and sewerage scheme must be up to date.

The Chairman referred in complimentary terms to the brief but interesting description Mr. Hope had given them, and the vote of thanks was warmly carried.

The meeting was then adjourned to Saturday, August 10th, at Chester-le-Street.

VISIT TO THIRLMERE.

Outside the town hall large motor chars-a-banc, to seat twenty-four each, were in waiting, and the delegates were conveyed to Thirlmere. The day was dull but warm, but by the time Wythburn was reached the sun was shining brilliantly. The scenery all along the route was greatly admired, hill and lake being studies in pearl grey and pastel pink, illumined here and there with iridescent gleams of soft but radiant colour. Leaving Keswick by way of Chestnut Hill, the road lay through a district which has many literary memories. On the way we passed the house where Hall Caine lived; the cottage in the garden of which Shelley played hide and seek with his child wife; Windy Browe, where Calvert, the friend of Southey, Coleridge, and Wordsworth, lived. From the high ground, looking backward, we had magnificent views of Bassenthwaite and Derwentwater, and had the punishment which overtook Lot's wife been in force we should all have been turned into so many pillars of salt. The hedgerows through Naddle were a perpetual consolation. Where they were not made blue as the smoke of a peat fire by the clambering vetches, they were blushing pink under a festoon of wild roses. The light was so actinic that over towards St. John's the cushions of heather made a defined patch of colour, while the foxgloves reared their purple spikes from the bracken by the wayside. After passing the huge rock which Sir Walter Scott has invested with romance in his "Bridal of Triermain," we were soon running along the shores of Thirlmere, that lakeland urn from which Manchester enjoys the felicity of drawing its water supply.

The cars drew up at the entrance gates of the handsome castellated straining well, and here the party were welcomed by Alderman Smethurst, vice-chairman of the Water Committee of the Manchester Corporation; Mr. Benton, the manager of the waterworks; Mr. Sandham, assistant manager; and Mr G. Pattinson, the corporation's agent at Thirlmere. Here Mr. Benton took charge of the party, and explained the engineering features of the straining well. The well, which is practically the conning tower of the whole system, is 65 ft. deep and 37 ft. 6 in. in diameter. Every drop of water on its way to Manchester passes through this well. Everything was spotlessly clean, every piece of brass shining like so many mirrors. The huge hydraulic crane was swung out over the well for the benefit of the visitors, and many of them made the lengthy journey down the spiral stairway to the lower platform. The dam and valve house on the other side of the lake were inspected on the return journey, of which more anon.

The motors were next mounted and the party was taken on to Wythburn, where light refreshments were served at the Nag's Head Hotel. Then the journey was continued to the top of Dunmail Raise, where the party, under the guidance of Mr. W. Finch, the county surveyor for Cumberland, inspected the road made by the Cumberland County Council. This road and the roads made and maintained by the Manchester Corporation were much admired.

The return journey was made on the western shore of Thirlmere, under the scarred face of Raven Crag, which towers magnificently in one sheer precipice from the roadway. Mr. Sandham met the party at the dam and conducted them over the embankment and through the valve house. The level of the lake has been raised by means of this great embankment something like 35 ft., and it can be raised to its full extent of 50 ft. The embankment is 857 ft. long, 104 ft. high from the foundations, and has a width at the top of 18 ft. 6 in. We were then shown how the compensation water is discharged into St. John's Beck.

Briefly, a few facts about the Manchester supply may not be out of place here. The corporation has raised the area of the lake from 330 acres to 690 acres, and when raised to the full extent of 50 ft. it will have an area of 793 acres. The length of main from Thirlmere to Manchester is just over 95 miles. The storage, when all the works are completed, is estimated to provide 50 000,000 gallons per day for 160 days, even if no rain falls during that time, without drawing below the original level of the lake. The cost of the watershed and lake and the works has amounted to about £3,500,000. The third line of pipes is now being laid. When the five lines of pipes have been laid and the lake raised 50 ft., it is estimated that the cost will be about £5,000,000. The length of new roads constructed by the corporation is 8 miles 1,130 yds. Altogether, Thirlmere is a gigantic undertaking, and the visit could not fail to be profitable to so many municipal engineers.

VISIT TO QUARRY.

After leaving Thirlmere, the motors made a quick run to Bram Crag, where the huge quarry of the Threlkeld Granite Company is situated. Here we were met by Mr. Bragg, the courteous managing director of the company, who was accompanied by Mr. Barrow, the company's accountant, and Mr. H. Noon, quarry foreman. This quarry is one of the largest—if not the largest—in Great Britain, for the rock face is 150 ft. high and 750 ft. long, and very soon it will be a ¼ mile. Here the visitors were entertained to a novel sight, three shots having been laid for firing for their benefit. One of the drills would be about 12 ft., and the other two shorter. The first shot went off in about three minutes, the

second in two and a-half minutes, and the last in six minutes. The three shots dislodged something like 500 tons from the rock face.

The sheds where the granite setts are made were next visited, and many processes of interest to road engineers were seen.

Altogether, Mr. Bragg made the visit one of exceptional interest, especially to the representatives of municipal authorities, who were thus able to see in the making much of the material with which they have to deal.

On the return to Keswick, the party assembled at dinner at the Keswick Hotel.

ASPHALT-MACADAM.

By Cecil Nathan, A.I.E.E.

The intelligent use of any material in road construction depends to a great extent upon the knowledge possessed by the user regarding the characteristic properties of the material used. The more comprehensive his knowledge, the greater will be his assurance of success in any work of construction he may undertake. A certain amount of knowledge concerning the properties of materials may always be acquired by practical experience, and with some few types of materials, knowledge thus acquired, if properly applied, will prove sufficient to ensure satisfactory results.

The entire development of the modern macadam road is undoubtedly based upon sound scientific principles, and a number of very able and carefully trained minds played a most important part in this development. The work of such men as McAdam and Telford, as well as a number of their followers who developed and extended their theories, cannot be overvalued, but the principles which they taught were readily grasped by even the untrained mind, and were applied with comparative ease.

With the modern evolution of the ordinary macadam road to the bituminised form, the old situation has entirely changed, and while it is still possible for an engineer with little or no knowledge of the chemistry of road materials to construct a good road, his chances of doing so to-day are far less than they were in the old days of water-bound macadam roads, as the development of a new class of traffic has made it absolutely necessary to utilise some form of binder, other than rock dust, to hold the larger stone fragments forming the road crust in place, and so preserve the integrity of the road. For this purpose the bitumens as a class have given more promise of suitability than any other materials, and their utilisation during the past few years has developed to an enormous extent.

At the present time, however, many very able road engineers know bitumens only as black, more or less sticky substances which range from fluid to semi-solid consistencies. To some they are all tars, or all oils, or all asphalts, the meaning of these terms being at best very vague.

It is, of course, quite evident that the great majority of road engineers cannot also be chemists, nevertheless, they should have some knowledge of the origin, occurrence and production of various types of natural and artificial bitumens. They should have a comprehensive idea of the processes of refining these products, and the methods of manufacture by which they are converted into road materials. They would then not only be able to differentiate between coal tars, their distillates and residues, mixtures of tar with asphalt, petroleum residuums of paraffin, asphaltic or semi-asphaltic base, solid native bitumens, natural asphalts and asphaltic cements produced by refining and fluxing them, also rock asphalts or bituminous limestones, but also appreciate their great complexity in composition, which is accountable for their widely varying behaviour in practical use.

As the most useful test of any road material is the physical test, road engineers to-day naturally place most reliance in their observation of the behaviour of materials under practical trials, with the result that asphaltic cements produced by properly refining and fluxing natural asphalts, are to-day recognised as being absolutely the best known resilient, waterproof binders for macadam roads, because such materials are capable of withstanding all climatic conditions and of making each piece of stone adhere to its neighbour, thereby holding it up to its work, and at the same time able to resist any tendency towards ravelling or disintegration. When natural asphalt is used in the construction of roads on this principle, such roads are known as asphalt-macadam.

There are two methods of constructing asphalt-macadam road crusts: the first by placing broken stone or other similar aggregate from about 2½ to 4 in. deep (according to the nature of the traffic pertaining to the road in question) upon the sub-grade, and then applying the hot asphaltic cement by the so-called penetration method; and the second by which the warm, dry aggregate and hot binder are mixed in a suitable mixing machine before being placed on the road, this latter method being known as the mixing method.

Enough binder must be used in either method of construction to cover completely each particle of mineral aggregate and just to fill the voids, which naturally should be reduced to a minimum by the use of proper sizes of stone.

In both methods a moderately heavy, self-propelled tandem roller is used for thoroughly compacting the asphalt-macadam road crust into as homogeneous a mass as possible, after which a seal coating is usually applied. This seal coating is made by squegeeing a small quantity of asphaltic cement over the rough surface and sprinkling with about ¼-in. gauge stone chippings and re-rolling, the finished surface then having a mosaic appearance.

The penetration method is the simplest and cheapest, but there is no question that the results obtained by adopting the mixing method are far and away the most successful, as, unfortunately, in the penetration method the hot asphaltic cement, immediately it is poured upon the cold stone, becomes chilled and fails to penetrate as it is intended to do, with the result that, instead of the voids being entirely filled with asphalt, and as a consequence the stone being thoroughly coated on all sides, the asphaltic cement merely runs through the voids in small strings, which is of not the slightest use for holding the stone in place below that at the very top, hence attrition takes place below the top surface, and the roadway is therefore liable to quickly disintegrate under fast and heavy motor traffic.

As the solution of the modern road problem is not cheapness, but economical initial expenditure, the mixing method of constructing asphalt-macadam road crusts will in the future unquestionably be adopted by all road engineers after carefully considering both methods.

Machines are now available for mechanically mixing asphalt-macadam in their proper proportions. These machines vary from adapted batch concrete mixers to specially designed portable apparatus comprising, in some instances, driers and heaters for the aggregate, heating devices for the binder, combined with batch mixers, thus enabling the asphalt-macadam to be mixed and laid hot *in situ*. The development of new and improved machinery has undoubtedly been largely responsible for much of the progress recently made in bituminous road building, and while the importance of increased knowledge of materials should not be underestimated, it must be borne in mind that the efficient utilisation of new materials and their economical application have only been made commercially possible in many cases through the employment of suitable apparatus, thus not only cheapening operations, but also making possible work on a considerably larger scale than would be feasible without such equipment, hence it is that the road engineer, the contractor who builds the road, as well as the manufacturer of the road building equipment, all have a certain part to play in the development of the art, as the building of roads that will meet the demands of modern traffic conditions cannot be accomplished entirely by the efforts of any one individual or any one class, but needs co-operation among those who are engaged in the work.

River Pollution: Damages against Town Council. Mr. Justice Phillimore, at Oxfordshire Assizes, on Friday, granted an injunction restraining the Banbury Corporation from allowing sewage to overflow into the river Cherwell, and the plaintiffs, Mr. Stephen Spokes and Mr. John Frederick Spokes, of Twyford Mill, were awarded £2,250 damages.

Civic Government by Commission.—The commission form of local government is being given its first trial in Canada in St. John, N.B. Under the new arrangement the mayor, Mr. James H. Frank, will be head of the Finance Department, and each of the four commissioners will rule over another civic department. Two of the commissioners will serve for four years, the other two and the mayor for two years.

Methods for Differentiating Soils for Sewage Purification.*

By GILBERT J. FOWLER, D.SC., F.I.C., and WILLIAM CLIFFORD, ASSOC.M.INST.C.E.

The suitability of a soil for the purification of sewage is well known to be conditioned by numerous factors, physical, chemical and biological. Whether any one or more of the physical properties will serve as a measure of the suitability for sewage purification is a matter for observation and experiment. Messrs. McGowan and Finlow† have examined by mechanical analysis the soils and subsoils from eight sewage farms, and found that the rate of filtration seemed to be roughly proportional to the number of particles per gramme of the soil.

It is admitted, however, that complete mechanical analysis is a long and tedious process. An instrument devised by Dr. E. H. Hankin, and modified by one of us, for the purpose of rapidly differentiating the light sandy soils of the United Provinces and other parts of India for the treatment of sullage and waste matter, promised to be of service on English soil; this led to further observations and experiments, the main object of which was to see whether a simple mechanical test, not necessarily mechanical analysis, would afford sufficient data to allow of an approximate calculation being made of the amount of sewage which a given soil and subsoil would filter under the usual methods of broad irrigation.

The subject will be considered under the following heads:—

(1) Porosity, as determined by variable pressure porosimeter.
(2) Porosity, as determined by constant pressure porosimeter.
(3) Percolation experiments.
(4) Mechanical analysis.
(5) Volume contraction of soils.
(6) Water content of soils.
(7) Test for sewage-sick land.

VARIABLE PRESSURE POROSIMETER.

The instrument with which the following observations were made was, as above stated, devised by Dr. E. H. Hankin, and somewhat modified by one of us. An apparatus very similar in principle was used by Prof. King during his earlier investigations‡ on the flow of air through porous media.

The apparatus consists of (1) a strong galvanised iron cylinder (air reservoir) of approximately 5 gallons capacity, provided with a Bourdon pressure gauge reading from 0 to 15 lb.; (2) an air compression pump (really a stand bicycle pump), by means of which the air reservoir is charged; (3) a galvanised iron cylinder (medium container), 17 in. long and 11 in. diameter, open at the one end, but closed at the other by a conical-shaped cap to the apex of which the heavy blows necessary to drive the cylinder into the medium (sand or soil) are applied. A water tank and a specially constructed loose cylinder end having a rubber-lined groove are provided for investigations dealing with the effect of various liquids on the enclosed medium and for problems relating to the gaseous contents of sands and soils.

Method of Use. The experimental cylinder is driven by means of a mallet into the sand or soil the flow through which is to be measured. The air reservoir filled with compressed air (15 lb. pressure) is then connected to the earth-driven cylinder by means of a short piece of pressure tubing provided with brass unions. The cock to the air reservoir is now opened; the air expands freely into the conical end of the earth-driven vessel, and the pressure falls at once to about 10 lb. The pressure continues to fall, rapidly at first and then more slowly. The more porous the medium, the more rapid the fall of pressure.

The time taken for the pressure to fall to 1 lb. is noted. This is called the total time.

By noting the pressure each second of the time for the fall of each 1 lb. pressure, a pressure-time curve can be plotted, from which the centroid vertical§ can be calculated. This gives the mean time.

* Paper read at the Annual Summer Meeting of the Association of Managers of Sewage Disposal Works at Wolverhampton, reported in THE SURVEYOR of July 12th.
† Fourth Report Royal Commission. Vol. iv., Part II., p. 275.
‡ Geological Survey NIX, Annual Report U.S.A.
§ The centroid vertical may be considered as the Y ordinate through the centre of gravity of the area of the curve considered as a uniform lamina.

Experiments.—Several observations were made on a stiff soil in the garden of the Public Health Laboratory, York-place, Manchester, and on a loose garden soil at Urmston; the results indicated a relationship between the amount of the finest particles of a soil and the time of passage of the given volume of air. It was evident that to test the instrument satisfactorily it was necessary to try it on a number of soils *in situ* whose history was at least approximately known. The Wolverhampton sewage farm afforded such an opportunity, and a number of trials were made there, of which the following is a description:—

(1) Field No. 43. (*a*) The instrument was first tried in a sand pit. The loose sand was cleared away and the cylinder driven into the compact sand which lay in its natural bedding. Four observations were made. The total time in each case for the pressure to fall to 1 lb. was 23 seconds. (*b*) The sandy loam (recently ploughed) a few yards from the sandpit required only 5 seconds for the pressure to fall to 1 lb.—three observations gave the same result. (*c*) A further trial was made on a portion of the field which was being dosed

FIG. 1.—POROSIMETER.

with sewage at the time. The first attempt was negative, as the compressed air lifted the cylinder out of the soil. During the second attempt the cylinder was held down. The fall of pressure below 10 lb. was slow and could be easily followed. The air appeared to be displacing water from the soil, which was obviously saturated. The total time was 100 seconds.

(2) Field No. 44. (*a*) Sandy clay soil. Two observations gave total time 42 seconds each. (*b*) Peaty soil. Total time 12 seconds.

(3) Field No. 36. (*a*) Clayey loam soil. Total time 28 seconds. (*b*) 30 ft. from previous position. Total time 18 seconds.

(4) Field No. 32. Peaty soil. Total time 10 seconds.

(5) Field No. 12. Gravelly sand. Total time 6 seconds. The most porous and free filtering soils on the farm. Total time 8 seconds.

The following table [illegible] the foregoing [illegible]

EXPERIMENTS WITH VARIABLE PRESSURE POROSIMETER.

Date of experiment.	No. of field.	Nature of soil.	Total time for pressure to fall to 1 lb. (seconds).	Mean average time corresponding to centroid vertical of curve of fall of pressure (seconds).
Dec. 21, 1910	43	Sand.	23	9·61
" " "	43	Sandy loam.	5	1·75
" " "	43	"	100	2·10 water logged.
Jan. 17, 1911	44	Sandy clay.	42	10·71
" " "	44	Peaty soil.	12	1·56
Jan. 28, 1911	36	Clayey loam.	28	7·75
" " "	36	"	18	1·93
" " "	32	Peaty loam.	10	2·52
Feb. 5, 1911	12	Sandy gravel.	8	2·08

Remarks.—Omitting the results from the waterlogged soil (field No. 43) as obviously exceptional and not

comparable with the others, the total times vary from 5 seconds (sandy loam) to 41 seconds (clayey loam). The corresponding mean times vary from 1·75 second to 10·71 seconds. The increase in the time generally follows or rather accompanies an increase in the silt and clay content of the soil (see mechanical analysis), but there are evidently other factors to be taken into account. For example, the sandy clay in field No. 44 was apparently a less porous soil than the clayey loam in field No. 36, yet the latter had quite 10 per cent more silt and clay than the former. The explanation no doubt lay in the history of the two soils. Field No. 36 had been recently ploughed and worked up (five months previously), while field No. 45 had not been ploughed for eight or ten years.

CONSTANT PRESSURE POROSIMETER.

It was thought that the violent blows necessary to drive the cylinder of the variable pressure porosimeter into the soil would disturb its natural lie and so vitiate the results; further that the pressure was sufficient to produce eddies in the air passing through the capillary passages of the soil.

A modification of an apparatus used by Prof. King for measuring the effective size of soil particles was therefore devised. The apparatus consists essentially of an aspirator provided with a water-pressure gauge and a detachable soil-containing cylinder. The cylinder, which is turned out of 2½-in. tubing, is screwed at the one end, and has a sharp cutting edge

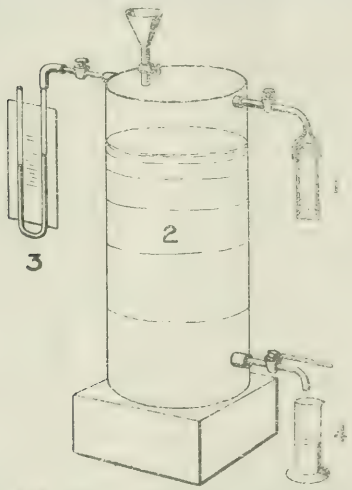

FIG. 2.—CONSTANT PRESSURE POROSIMETER.
1—Soil cylinder, 2—Aspirator; 3—Pressure gauge; 4—Measuring vessel

at the other. The screwed end is protected by a perforated cap when obtaining a sample of soil.

Method of Use.—The detachable cylinder with its perforated cap is used for obtaining a sample of soil much in the same way as a cork-borer is used for making a hole in a cork, except that in hard or stony soil a hammer may be used to assist in driving in the cylinder. On withdrawing the cylinder a core of soil remains within.

The cylinder, after removal of the cap, is screwed to the aspirator, care being taken to secure an air-tight joint. The flow of water from the aspirator reduces the pressure within the vessel, and air flows in through the soil contained in the cylinder. The difference of pressure, which is easily controlled by the water tap, is measured by a water gauge in the form of a U tube open to atmospheric pressure. On opening the water tap, which allows water to flow from the aspirator, the pressure (difference pressure between atmospheric and aspirator) increases until the flow of air through the soil balances the flow of water from the aspirator. When the pressure is constant the flow of water from the aspirator measures the flow of air through the soil. Generally the time for the flow of 3·000 c.c. of air through the soil at various pressures was noted. The pressures ranged from 1·0 c.m. to as much as 25·0 c.m.

The following test was made with two grades of clean, dry sand. One grade passed a 30-mesh sieve and was caught on a 60-mesh; the other passed 60-mesh and was caught on a 90-mesh sieve. The bottom of the cylinder was covered with fine copper gauze, the sand filled in a small quantity at a time and tamped lightly. First the 30-60 sand was used, then diluted successively with 9·1 per cent, 22·9 per cent, 32·5 per cent, and 41·1 per cent of the 60-90 sand. The time for the passage of 3 000 c.c. of air at a pressure of 3·17 c.m. was noted with the following result:—

	Sand.	Pressure.	Time (seconds) for 3,000 c.c. of air to pass.
		c.m.	
I.	100 per cent 30-60	3·17	61·5
II.	90·9 per cent 30-60 9·1 per cent 60-90	3·17	105·0
III.	77·1 per cent 30-60 22·0 per cent 60-90	3·17	146·0
IV.	67·5 per cent 30-60 32·5 per cent 60-90	3·17	174·0
V.	58·9 per cent 30-60 41·1 per cent 60-90	3·17	216·0

It will be seen that the increase of time is fairly proportional to the increase of the finer graded sand.

Three graded sands were tested separately, with the result given below:—

Grade of sand.	Pressure.	Time for 3,000 c.c. of air to pass through.
	c.m.	
20-30	3·0	27 seconds.
30-60	3·0	80 ,,
60-90	3·0	288 ,,

The results indicate that for clean, packed sand the time for the passage of a known volume of air gave a measure of the size of the particles. These results are in general agreement with those obtained by Prof. King.

The following results were obtained from samples of soil obtained in several fields, the numbers of which are given in the second column. The time of flow in seconds for 3,000 c.c. of air to pass through the cylinder of soil is given for three different pressures, although in many cases the flow at eight and ten different pressures was recorded, the range of pressure varying from 1·0 c.m. to 20·0 or 25·0 c.m. of water.

TABLE SHOWING TIME OF FLOW IN SECONDS FOR 3,000 C.C. OF AIR TO PASS THROUGH CYLINDER OF SOIL AT THREE DIFFERENT PRESSURES.

Date.	No. of field.	Nature of soil.	Time in seconds. Pressure. 20·0 c.m.	10·0 c.m.	7·0 c.m.

Remark.—The samples were taken generally midway between the grip (distributing gutter) and the

drain. Where two samples were taken from the same field on the same day, they were taken about 3 ft. from one another. It was noticed that the sampling cylinder was more difficult to drive into the soil during the dry weather of May than during the moister period of November and December. While the cylinder was always driven into the soil 12 in., the sample in the cylinder was often much less, owing to compression. Peaty soil adhered very tenaciously to the cylinder, and suffered most compression. Moist, sandy clay (No. 34) adhered very little to the metal and showed only slight compression. The apparent porousness of one of the sandy clays may possibly be due to air leaking by, between the soil and the cylinder, owing to the want of adhesion. The results obtained during the dry weather in May are higher than those obtained later in the year, and seem to point to the soil being less porous when comparatively dry than when moist. Further observations are required before a definite statement on this point could be made. The filling of the cylinder with sand by hand, and the taking of a sample of soil in the field, are two widely different operations. The contact made between the metal and the soil varies with different soils, and with the same soil with different water contents. *e.g.*, peaty soil was loose and porous in dry weather (summer), while in the wetter seasons it was almost as impervious as clayey soil. Clayey soils, on the other hand, were hard and impervious (to air) when dry, as in summer, but appeared more porous when wet; this, however, may be due to air passing between the cylinder and the soil, as clayey soil adheres but little to the metal.

PERCOLATION EXPERIMENTS.

Where the soil is fairly uniform and the ground water level is not too near the surface, it would seem that the relative porosity of the soils might be directly determined by noting the rate of flow of water from vertical holes or miniature wells into the surrounding soil.

One of the two methods used by Mr. L. F. Richardson* for determining the porosity of peat is an application of the same idea to known boundary conditions.

The measurements summarised below were obtained from two sizes of cylindrical holes, both 12 in. deep, one 2¾ in. diameter, the other ⅜ in. diameter.

Method of Observation.—A wood ring on which the neck of an inverted bottle would rest was placed over the larger hole, into which water was poured to near surface level and allowed to percolate some time before beginning the measurement. The level of the water in the hole was then brought to within 2 in. of the surface, and a bottle of known capacity filled with water was inverted over the hole. The mouth of the bottle touched the water and formed a water seal for a moment. A slight lowering of the water level in the hole admitted air to the bottle, and so maintained a fairly constant level of water in the hole. The time taken to empty the bottle was noted. A small glass funnel was fitted into the smaller holes, and the bottle inverted on the funnel. In this case the water level was maintained slightly (from 1 in. to 1½ in.) above the surface of the soil.

Rate of Percolation from Holes in the Soil 12 Inches Deep and 2¾ inch and ⅜ inch Diameter Respectively.

Date.	Field.	2¾ inch.	⅜ inch.
Nov. 15, 1911	12 Gravelly sand	153 c.c. per min.	85·4 c.c. per min.
" "	12 "	99·1 "	21·2 "
" "	12 "	——	13·4 "

" "	16 "	133·5 "	22·5 "
Dec. 19 "	26 Sandy clay	20·1 "	1·7 "
" "	26 "	19·8 "	1·2 "
" "	26 "	102·0 "	——

*Hole 6 in. deep only.

Remarks.—Considerable variation occurs in the same field, in the rate of flow from both holes—*e.g.*, the two large holes in No. 12 gave 153·0 c.c. and 99·1 c.c. per minute, while the three small holes gave 85·4 c.c., 21·2 c.c. and 13·4 c.c. per minute respectively. Again, in No. 3, four small holes gave 41·4 c.c., 20·1 c.c. 86·3 c.c. and 18·9 c.c. per minute respectively, yet when averages are taken the freer filtering soils stand out from the stiffer and slower filtering soils. The high result (145·6 c.c. per minute) obtained from one of the larger holes in No. 34 is probably explained by the fact that the cylinder had passed through the overlying clayey loam into a sandy subsoil at that point. The rate of flow from the smaller hole was, as was to be expected, less than from the large hole.

* "Proceedings," Royal Dublin Society, Vol. XI., N.S., No. 27.

MECHANICAL ANALYSIS.

When it was proposed to examine the soils by mechanical analysis, the main idea was to see whether there was any relation between the quantity of the finer constituents of the soil and the results obtained by the various methods of examining the porousness of the soils, meaning, by the "finer constituents," all that would pass a 90-mesh wire sieve. The choice of 90-mesh was quite arbitrary. It would have been much more satisfactory if a definite-sized mesh—say 1 mm., had been chosen. Six sieves were used at first, having 10, 20, 30, 40, 60 and 90 mesh per inch respectively, but three (10, 20 and 40) were soon discarded as introducing unnecessary grading.

The following table shows the diameter of the wire and the length of the side of the mesh in terms of inches and of millimetres.

Mesh per linear inch.	Diameter of wire.	Length of side of mesh inch.	Length of side of mesh mm.
10	·0148	·0852	2·172

Sample.—The sample was taken from the cylinder of soil used for the constant pressure porosimeter, and included the upper 12 in. of soil; generally the lower 3 in. or 4 in. would be classed as subsoil. The larger stones were picked out and weighed separately, a proportionate part being allocated to the sample, which varied from 40 to 100 grammes.

Method of Analysis.—The fresh soil, which was weighed in a porcelain dish, was covered with water and triturated with a glass rod, having the end protected by a piece of rubber tubing. The muddy liquid was then poured on to the nest of sieves (30, 60 and 90 mesh) which had been previously wetted and which rested on a shallow dish. A piece of rubber tubing attached to the service tap provided means for a fine jet of water; this was directed into the porcelain basin and eventually washed the soil on to the coarsest sieve. The washing was then continued on the sieve, the protected glass rod being used to separate and break down the aggregates. When the particles remaining on the larger sieve were clean, that sieve was removed and the process continued on the next sieve, and so on to the 90-mesh sieve. The whole of the waste water (3 or 4 litres) and the fine sand which passed the 90-sieve was collected into a tall beaker and allowed to stand twenty-four hours. The opalescent liquid was then syphoned off and the sediment (fine sand, silt and clay) dried and weighed. Several determinations were made of the amount of

matter that would settle from the opalescent liquid after six days. The amount varied from 1 to 3 grammes. No correction, however, was made to the figures for silt and clay. The washed gravel and sand on the sieves were dried, and before weighing the sieve was shaken over a clean dish. That which passed through was transferred to the next sieve. The amount passing the 90-sieve dry was added to the "silt and clay."

Remarks.—In the foregoing table the fields are placed in the order of the silt and clay content.* This order agrees well with the observed filtering capacity; the lower the silt and clay content the greater the filtering capacity. The peaty soils, however, are somewhat exceptional; they have a higher percentage of matter that passes a 90-mesh sieve than the clayey soils, but are on the whole more free filtering. During dry weather peaty soil is more freely fissured, thus affording easy lines of drainage.

VOLUME CONTRACTION.

The cracks observed in soils have often been commented on, but their significance in relation to the purification of sewage does not appear to have received that attention which they deserve. The amount of contraction on drying, and the conditions which favour or retard drying are matters which have a practical bearing on the land filtration of sewage.

Messrs. Cameron and Gallaghert give a useful summary of the previous work on the physical condition of soils, and describe two new methods for determining the expansion and contraction of soils. In both methods the measurements are made at intervals as the column of soil under observation dries. It occurred to one of us to magnify the contraction of the soil by a long lever and to record the motion of the lever continuously.

Method of Observation. A sample of soil was obtained by means of a thin walled brass tube 1·2 in. diameter, having a sharp cutting edge, used in the same way as a cork-borer, the upper 2 in. of soil having been previously removed. The core or cylinder of soil, which was 2½ in. to 3 in. long, was trimmed down to 2 in., and weighed in a small aluminium dish. Weighings were also made every twenty-four hours and the loss of moisture noted. A light flat-headed brass pin, with the point upward, rested on the column of soil. A carefully balanced wood lever rested on the pin point. The end of the lever, which was provided with a parchment point, recorded the contraction continuously on the smoked paper of a clock-driven drum. From the linear decrease of the column the percentage volume contraction was calculated by the formula

$$D = l - (l - x)^3$$

where x represents the unit linear change.

The subjoined table gives a summary of the results obtained with four soils:—

Remarks. Apart from any question as to the correctness of the estimate of contraction the figures afford practical value in the light they throw on contraction during the first forty-eight hours—i.e., in the variations of volume which lie within the range of the moisture content of the soil. Taking the average quantities of the moisture content of soils from fields numbered 12, 3, 44 (gravel and sand) and 44 (peaty) as 7 per cent, 10 per cent, 6 per cent, and 10 per cent respectively, the corresponding decrease of volume is about 1·9 per cent, 5·0 per cent, 3·0 per cent, and 9·5 per cent respectively. In other words, the peaty soil decreased in volume nearly twice as much as the clayey soil and the sand loam, and five times as much as the sandy gravel. The large volume contraction of peaty soils in dry weather resulting in innumerable fissures explains to a certain extent the ease with which liquid passes from the surface into the drains, the high silt and clay content notwithstanding.

MOISTURE CONTENT OF SOILS.

Two sets of determinations of the moisture content were made—one on mixtures of the upper 12 in. of soil, the other on the upper 3 to 5 in. of soil. The determinations on the upper 3 to 5 in. were continued

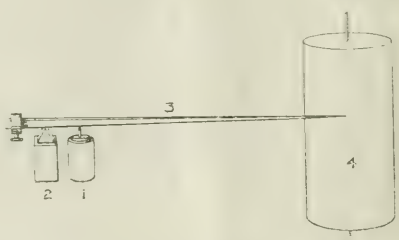

Fig. 3.—Arrangement for Recording Contraction.

over several months, each determination being made on a mixture of from five to ten samples taken at different parts of the field, and as near as possible midway between the grips (distributing gutters) and the drains.

The first table gives the results for the 12-in. samples. The second summarises the results of 75 determinations, during January, February, March, April, June, October (the latter two months were unusually dry.).

A METHOD FOR ESTIMATING THE CHARACTER OF ORGANIC MATTER PRESENT IN SOILS.

In the first place a determination of the moisture content (loss on drying) is made. A quantity of the air-dried soil equal to 5 grammes of dried substance is mixed with sufficient water to form a 90 per cent sludge (10 per cent solid, 90 per cent liquid). This is then diluted to 500 c.c. in a large cylinder, and well stirred. After two hours' settlement, a clarification test* is made on the settled liquid. As a further check it is of interest to determine the loss on ignition of the sediment formed after two hours' standing of the diluted liquor. The quantities to be used for the oxygen absorption test are dependent to some extent on the character of the soil.

A sufficient number of observations have not yet been made to say with certainty how far this method is of value, but the following results will indicate

* The silt and clay content includes very fine sand and nearly corresponds to the three particle-sizes, fine sand, silt and clay—given by Messrs. Hall & Russell and Messrs. Cameron & Gallagher.

CONCLUSION.

The foregoing results, although limited in number and dealing only with a few kinds of soils, indicate that soils can be differentiated as to filtering capacity by various mechanical tests. Further investigation is required, and physical data accumulated about soils of known capacity for filtering and purifying sewage. Generally speaking, the relative porosity of sandy soils can be measured by some form of instrument for passing a known volume of air through an isolated portion of soil. Direct percolation with water may be useful where other means are not available. The simple form of mechanical analysis above described would appear to be sufficient for all practical purposes. The finest mesh sieve (90) was chosen quite arbitrarily, and was more a matter of convenience. It might be available to take a 100-mesh sieve as a standard for future work. The anomalous results obtained from peaty soils show that caution will need to be exercised in interpreting results. The peaty soils, judged by the porosimeters, by direct percolation and by mechanical analysis, are less porous than the clayey soils, yet practical experience indicates that they are not less capable of dealing with sewage, especially during dry weather. The explanation probably lies in the larger volume contraction, which takes place on drying. Innumerable fissures are formed, thus providing easy passages for the liquid.

Hence, although the porosity of a soil depends largely on the proportion of the finer particles present, the influence of moisture and colloidal matters as affecting the texture of the soil require to be taken into account. The method of working the soil and of irrigating the same have an enormous influence on the filtering capacity; indeed, by indiscriminate flooding, a fairly open soil may be so compacted as to render it almost impervious. With the loose porous soils of Central India the native method of intermittent irrigation of small plots has much to recommend it. In this country, with less evaporation, moving spray jets may usefully be employed with very porous soils.

MUNICIPAL ENGINEERING WORK AT NEWCASTLE-UPON-TYNE.

CITY ENGINEER'S REPORT.

In reporting upon the works executed by his department during the year ended March 31st last, Mr. W. J. Steele, city engineer and town surveyor of Newcastle-on-Tyne, quotes the following statistics: Area of city, 8,452 acres; population (estimated), 269,193; rateable value, £1,649,497; inhabited houses (each flat being counted as one house), 50,294; highways, 250 miles; bridges maintained by corporation, 27; sewers, 275 miles; parks and open spaces (inclusive of Town Moor), 1,400 acres; tramways (in single track), 54½ miles; quays, 6,380 lin. ft.; quayside railways and sidings (in single track), 2½ miles; transit sheds (area of floor space), 175,275 sq. ft.

The estimated increase in the population is 2,522, and the density over the whole area of the city is 31·84 per acre. If the public open spaces are deducted, the density is 38·17 per acre, and varies from 2·47 in the parish of Fenham to 123·24 in the parish of Westgate. Under the provisions of the Housing and Town Planning Act, 1909 (says Mr. Steele), the density will probably not exceed 80 persons to the acre in any area where the Act is applied. All other things being equal, it has been established that the density of the population has considerable influence on the health of a community; consequently it is of importance that full advantage should be taken of any means by which the density can be kept at a reasonable figure.

BACK STREETS.

In considering this subject it is questionable whether the provision of back streets is always necessary in developing land for building purposes. The land required for back streets would be put to much better use if it formed part of the open space at the rear of the buildings. Where semi-detached houses are erected, ample space can be provided at the flanks of the houses for the drains, water and lighting services, the delivery of coal, and the removal of refuse. These requirements can be provided for in terrace houses, if the number of houses in any terrace is limited to about eight, by means of a passage about 6 ft. in width being made between the terraces and continued at the back of the houses. In their present form the cost of constructing back streets is a considerable charge upon the property owner, and their future maintenance, cleansing, lighting and watching a heavy charge upon the rates.

The number of dwellings erected during the year (each flat being counted as a separate dwelling) has been 251, or 59 less than in the previous year, and the lowest number recorded since 1882. It is about 220 short of the number required to meet the estimated increase in the population. The estimated number of empty dwellings in the city is 500, and at the present rate of building this number should be rapidly reduced. The estimated cost of new buildings for which plans have been approved by the committee during the year is £341,351, compared with £391,271 for the year 1911, and £476,200 for the year 1910.

TOWN PLANNING SCHEME.

The Local Government Board have sanctioned the preparation of a scheme under the Housing and Town Planning Act, 1909, for the Crag Hall Dene area. The area extends beyond the boundaries of the city into the district of the Urban District Council of Gosforth and negotiations are in progress with that council with regard to the next procedure under the Act. A scheme for the eastern portion of the city, embracing an area of 1,540 acres, is being considered by the committee.

PRIVATE STREETS.

The number of streets in which work was executed under the Private Improvement Acts was 51, but in several cases only a very small amount of work was done. The policy, so far as conditions permit, of only carrying out such work in any street as building de-

velopment demands, delays the declaration of such street as "a highway repairable by the inhabitants at large," and gives it an unfinished appearance, but the principle, in the opinion of the city engineer, is undoubtedly just to the frontagers.

A large number of the old streets were resurfaced with tar-macadam, the total area laid being 20,702 sq. yds., representing in length about 1¾ miles.

THE CITY'S HIGHWAYS.

The approximate total length of the highways now maintained by the corporation is 250 miles, of which about 75 miles are back streets. The cost of maintenance only for the year, after reducing the mileage of back streets so as to be equal in width to front streets, is £108 per mile. From a recently compiled statement of the cost of maintaining highways in several towns in the country, the average cost per mile is about £138; therefore, Mr. Steele points out, the total cost of maintenance in the city is £6,000 lower than what it would be if the average of other towns was reached. Persistent requests are made for the resurfacing of chip-paved streets with tar-macadam, and the committee set aside a sum each year for this purpose, but, owing to the limited funds at the disposal of the committee, many years must elapse before the numerous requests can be complied with; for the current year (1912-13) a list of streets entailing an expenditure of £23,811 was considered, but only £4,635 could be allocated for the work.

REFUSE DISPOSAL.

During the year 136,964 tons of refuse were disposed of; 44,499 tons were deposited on tips within the city, 40,284 tons sent to sea, 34,512 tons burnt at the destructors, and 17,669 sent by rail to various farms. Exclusive of trade refuse, the house refuse amounted to 88,272 tons, and is equivalent to 6·56 cwt. per head of the population, or 35·10 cwt. per house, the cost of removal and disposal being 21·14d. per head of the population, or 9s. 5·12d. per house. The street refuse amounted to 45,254 tons, and is equivalent to an average of 181 tons per mile of highway cleansed.

SNOW REMOVAL.

During the winter the cost of removing snow from the highway was £1,395, against £364 during the previous winter. In regard to this Mr. Steele remarks: "If any further evidence were required, these figures show the impossibility of making an accurate provision in the annual estimates for this service, but fortunately the saving in other services rendered it unnecessary to submit a supplementary estimate to the council."

THE OUSEBURN VALLEY CULVERT.

The Local Government Board having sanctioned a loan for the extension of the culvert in the Ouseburn Valley, a contract has been entered into with Mr. W. T. Weir, of Howdon-on-Tyne, and the work is in progress. When this extension is completed it will permit of the continuation of the embankment forming road No. 2 under the Corporation Act, 1904. During the year 81,809 loads of material were deposited in the embankment (18,038 from the corporation and 63,771 from other sources), giving an average of 1,573 per week, as compared with an average of 1,176 loads during the previous year.

TRAMWAYS.

With the exception of a few places on the heavy traffic routes, which are having attention, the permanent way of the tramways is in a reasonably good condition. The cost of maintenance during the year was £5,215, or £96 11s. 5d. per mile, measured in single track; the cost of renewals of junctions, crossovers and straight track was £2,326, or £43 1s. 5d. per mile. Including maintenance and renewals, the cost per mile was £139 12s. 10d. During the ensuing years the cost of maintenance will inevitably increase, owing to the fact that during the ten years the system has been in operation an exceptionally small amount of renewals has been required, an eloquent testimony, the city engineer observes, to the sound work in the original laying of the track.

London County Hall. In reply to questions at the last meeting of the London County Council, it was stated that tenders for the superstructure would be invited for January next, with a view to the work being commenced in April. It was anticipated that the whole building would be completed by midsummer, 1916.

SOME NOTES ON BIRMINGHAM

INSPIRED BY THE SUMMER MEETING OF THE INSTITUTE OF SANITARY ENGINEERS.

By A. J. M., M.INST.C.E., F.G.S.

[On Friday and Saturday of last week the Institute of Sanitary Engineers met at Birmingham, were entertained at a reception dinner by the Lord Mayor, Alderman Bowater, and visited, among other places, the sewage farm, filter beds, and University. The following general notes are given in connection with the meeting.]

The Institute of Sanitary Engineers is to be congratulated on its choice of a place for its summer meeting. The capital of the Midlands is a city in which any body of men might be glad to assemble, but it is peculiarly appropriate in the case of a gathering of sanitary engineers, and there are many lessons which we can learn from it.

Ancient as Birmingham is—and its origin is lost in the mists of antiquity—the main part of its history is bound up with the past two centuries. Little more than 200 years ago, when good Queen Anne came to the throne, Birmingham was a quiet country town of some 15,000 inhabitants. To-day it occupies the proud position of second city in England. It has close on 900,000 people—more than London itself could boast at the opening of the nineteenth century—and the million is not far off. Birmingham stands to-day impressive in size, in stateliness, and in the magnitude of its world-wide trade.

The point of chief interest to engineers is that the Birmingham of to-day is largely the creation of the engineer. Deprived by Nature of most of the advantages on which the prosperity of other towns has been built up, Birmingham has had to fashion them for itself. Other manufacturing centres owe their origin to the possession of water power. Birmingham's motive power has been won for it largely through the genius of two of its own citizens—James Watt and Matthew Boulton. Other towns derive their importance from the great waterways on which they stand. Birmingham, remote from the sea, and without a navigable river, has had to cut its own canals, and later to lay the iron roads which link it with the rest of England and with the sea. It draws its supply of raw materials from every quarter of the globe. Its wares are sought and prized all over the world, and most of all throughout that mighty empire which Birmingham's grand old citizen—Joseph Chamberlain—has done so much to develop and consolidate.

The engineer has not only provided means for the cheap and speedy conveyance of goods from one corner of the earth to the other. He has also annihilated distance by the introduction of modes of communication which enable us to make our wants known on the instant to those who are able to supply them. Only the other day a great Atlantic liner, one of the two largest ever built, was wrecked on her maiden voyage. But in that brief and crowded interval before she sank she sent out into the darkness a cry for help. And far away in the night the "Carpathia" heard it, and hurried to her aid. An incident like this fires the imagination; but the daily triumphs of applied science pass unheeded. We do not realise, though lately we have had some startling reminders, how precarious our own lives would be without the means of communication which the engineer provides for us. Time was when famine was rife in one county of England while the adjoining county enjoyed a good harvest. We have changed all that. If the harvest in one district fails, the news is flashed at once all over the world, and the surplus food from more favoured regions pours in to supply the need. A great city like Birmingham, dependent as it is for its very existence on food grown outside its own borders, levies tribute upon every quarter of the globe. Wheat from India and Canada, mutton from New Zealand, beef from the Argentine, tea, coffee and spices from the Far East, flow in in an endless, unfailing stream.

But a great modern community has other needs than mere food, and in satisfying some of these Birmingham, by reason of its geographical position, is faced by greater difficulties probably than any other city in the kingdom. It occupies the very summit of the south Midlands, the ridge of the roof, so to speak. It lies on the head waters of streams which flow northward to the distant Humber, and of others which make their way south-west to the Bristol Channel. The local gathering grounds are small, and not above suspicion. Badly, indeed, would Birming-

ham have fared for water had it not been for that great underground reservoir, the new red sandstone, upon which the city is built. Some twenty years ago the demand for water began to press upon the limits of the local resources. The corporation, under the advice of the late Mr. James Mansergh, brought in a new supply from the mountains of Radnorshire, a distance of about 80 miles. Ample provision has been made for future requirements, the works being capable of development to supply 75,000,000 gallons per day, or more than three times the present consumption. £6,500,000 has been spent on the scheme, which ranks as the greatest undertaking of the kind in the world.

Having at such great cost brought in a wholesome and abundant water supply, Birmingham is confronted with the problem, scarcely less formidable in its way, of getting rid of it after it has been used. In the first place the sewage is heavily charged with manufacturing refuse, including acids, which microbes, as we all know, abhor. In the second, Birmingham, through its position, to which we have already referred, high up in the watershed, has no large and friendly river to receive its purified sewage. The latter, therefore, has to run the gauntlet of a string of critical neighbouring authorities in a tiny stream whose normal flow above the outfall is actually less than that of the sewage. Birmingham is fortunate in having in charge of its sewage works an engineer who can convert such an unpromising liquid as he has to deal with into an effluent which actually improves the stream into which it is discharged.

So much for the sanitary work which is carried on in Birmingham. And now let us glance at the result. The city is stated by the medical officer—and he seems to have good grounds for the claim—to be the healthiest large manufacturing city in Europe. Birmingham has not always occupied this proud position. The death-rate in 1874 was 26·8 per 1,000. By 1910 it had been reduced to 13·67, practically one-half. But death-rates convey little meaning to some of us. Let us take it another way: 7,777 people died in 1910. If the 1874 rate had been maintained, the death-roll would have been nearly twice as great. The saving is equivalent to one life in every hour of the twenty-four, on six days in the week, in every week in the year. It is a grand achievement, and one of which the corporation and their officers have every right to be proud.

Nearly 2,000 years ago there was a great writer who said: "We are members one of another." It is true now, was the case then, very much more so as to-day. The march of invention, the triumphs of engineering, the progress of specialisation have given the old text a new meaning and a breadth of application which was undreamt of at the time it was written. The independent family, the independent community, has long been a thing of the past. The life of every one of us is dependent on the work of hundreds, if not thousands, of others of whose very existence we are hardly aware.

Unfortunately we do not always remember our membership and its obligations. There are one or two present-day tendencies which are very sinister. One is the ignorance and indifference of a great many people in the comfortable classes with regard to the conditions under which their less fortunate fellow-countrymen live. Another tendency, and it has been developing at an alarming rate of late years, is to take advantage of the dependence of different sections of the community upon each other to blackmail the country at large. If it were only the employers or the well-to-do classes who were attacked, it would be another matter, for these classes can, as a rule, take care of themselves. But this is not the case. The victims of the new economic warfare are chiefly found among the weak and the poor, to whom the enforced idleness, and the enhanced prices of the necessities of life brought about by a conflict in which they have no part, are wellnigh crushing misfortunes. And the sanitary engineer cannot afford to view with indifference an industrial warfare which throws even the sanitary service out of gear and sacrifices human life on the altar of hate. Birmingham has an enviable record in the matter of trade disputes. Its working men have a high reputation for independence and intelligence. They are not the sort of men to be wheedled or driven against their will into an ill-advised or suicidal conflict. It is, moreover, the birthplace of those land and building societies which have done so much to give the working man a stake in his own country, with the result that wealth is more evenly distributed here than in many other less favoured towns.

In other matters more closely affecting health Birmingham shows a worthy lead. A generation ago it was the rule, and not the exception, as in so many other places, for every family to inhabit a separate house. More recently, during a congress of the Royal Sanitary Institute, the then Lady Mayoress called attention to the absence of underground and cellar dwellings. Birmingham, like other towns in the North and Midlands, is not without its back-to-back houses or its slums, but the housing question has been vigorously attacked during the past ten years, and the medical officer is able to report a great change in the ideals of the poorest inhabitants with regard to house accommodation.

The corporation maintains, too, a large staff of lady health visitors, whose happy combination of tact with expert knowledge secures them a welcome wherever their friendly help and advice are needed. Infant consultations also are held in various parts of the city. It is not surprising that the infant mortality in Birmingham, though still much higher than it ought to be, is steadily decreasing year by year.

In yet another direction Birmingham sets an example which other towns would do well to follow. It employs no fewer than four whole-time smoke inspectors, and by means of cautionary letters, followed if necessary by police court proceedings, it is making an earnest effort to deal with the smoke nuisance. The gas and electricity departments might do a great deal to forward this good work, which at present, if report does not belie them, they oppose by taxing their own customers to relieve the rates of those who pollute the air with coal smoke. Is the day far distant when Birmingham will import gas and electricity instead of coal, and when the coal-cart will be relegated to that limbo to which the water-carrier and the tinder-box have preceded it?

The Lord Mayor of Birmingham (Alderman W. H. Bowater) extended a most hearty welcome to the members of the Institute of Sanitary Engineers on Saturday. He pointed out that the death-rate in that city had been reduced by about one half as compared with what it was thirty years ago. That improvement had been brought about by many causes, but by no means the least cause was the work which had been accomplished by sanitary engineers, who had assisted in a great measure in improving the conditions under which the people lived.

The President (Mr. A. J. Martin, M.Inst.C.E.) declared that Birmingham had a claim on the respect and admiration of the whole country. Its excellent water supply would undoubtedly be responsible for the better physique of the citizens and for immunity from disease.

At a dinner held in the evening at the Midland Hotel, Mr. A. Brown (chairman of the council of the institute) proposed the toast of "The City and Trade of Birmingham." "The Institute of Sanitary Engineers" was proposed by Dr. Bostock Hill, who expressed the view that there were indications in every circle, from Parliament downwards, that sanitation was now receiving that consideration which in the past it had failed to obtain.

The President, in response, said their most important task was to teach the man in the street and the woman in the house to appreciate the importance of sanitation and call attention to the laws of health. He attached greater importance to the task they had undertaken of instituting and carrying through a national health week to make the people themselves demand conditions favourable to health and to co-operate in securing these conditions than he did to all technical work.

Association of Consulting Engineers.—A general meeting of duly elected members of the Association of Consulting Engineers will take place on Monday next, the 22nd inst., at 4.45 p.m., at the Institution of Electrical Engineers, Victoria Embankment, W.C.

New Court House for London.—The London County Council have approved a report of the Local Government Committee recommending that the existing Court House at Newington should be demolished, that a new Court House should be built on the site and on adjoining land belonging to the council, and that pending its completion Quarter Sessions should be held at the old Clerkenwell Sessions House, which should be disposed of as soon as the new Court House had been provided. The gross cost was estimated at £100,000.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The following books have been awarded to the two winners of the premium for June, viz.:

Mr. G. B. R. Pimm, of Wexford, has selected

"A Manual of Reinforced Concrete," by Marsh and Dunn (Constable), and

"Lectures on Cement," by Blount (Institute of Chemistry).

Mr. H. F. Wilkinson, of Tottenham, has chosen

"Reinforced Concrete Design," by Faber and Bowie (Arnold).

The above have been duly forwarded to the successful competitors.

QUESTIONS.

This week answers are invited to the following questions:—

252. Girder Bridge.—Design a girder bridge to carry a 24-ft. road over a river and railway (at an angle of 60°) of two spans, 70 ft. and 42 ft. respectively. The mean height of road surface above bed of river is 21 ft. 6 in., and 17 ft. above rails, and the foundation is clay. Please show calculations and give an estimate of the cost. ("Nomad.")

256. Leak in Drain Pipes.—What is a reasonable amount of leakage to be expected in newly laid stoneware drain pipes of 6 in. and also 12 in. diameter? State the type of joint, average depth of trench, and class of soil. Is one gallon per mile of pipe per hour a permissible amount? ("Welsh.")

258. Roof Design.—Is it necessary or advisable to allow for expansion and contraction in a roof of 50-ft. span? What is a simple and efficient arrangement for such a roof, assuming that this is required? ("Student.")

§ 260. Refuse Disposal.—Where there is no system of sewers in a district, what are the best methods of collecting, removing and disposing of the fluid and solid refuse from the community?

261. Deflection of Beams.—If two precisely similar beams of rectangular section, one of cast iron and the other of wrought iron, were laid across the same span and loaded with the same load (within the elastic limit), what would be the relative deflections of the two beams?

REPLIES TO QUESTIONS.

259. Mechanics.—What is meant by "Instantaneous centre of rotation"? Give an example. What points on the rim of a carriage wheel are moving at the same rate as the middle of the axle? ("A.M.I.C.E.")

By a theorem known as Chasles's Theorem, any displacement of a lamina in its own plane is equivalent to a rotation about some finite or infinitely distant point. Consider, for example, the circular lamina A B C (Fig. 1). Suppose that in consequence of the displacement of the lamina the point A moves to B while the point B moves to C. Now since A B, B C represent two positions of the same line in the lamina, they must be equal, and it is obvious that this displacement could have been effected by means of rotation about O, the centre of the lamina, through the angle A O B. If the three points A B C were in a straight line, then O, the centre of rotation, would be at infinity, and the motion would be a pure translation because every point of the lamina would be displaced parallel to A B through a distance equal to A B. Now if we consider any continuous motion of the lamina, it will be seen that it can be brought from any position to a neighbouring one by rotation about the proper centre. When the two positions are infinitely close this centre is called the instantaneous centre of rotation of the lamina. The instantaneous centre of rotation has the following properties:

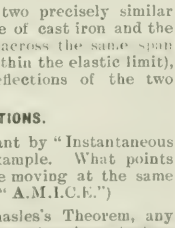

Fig. 1.

(1) The direction of the motion of any point on the lamina for the instant in question is at right angles to the line joining it to the instantaneous centre of rotation.

(2) The velocities of the various points on the lamina for the instant in question are proportional to the lengths of the lines joining them respectively to the instantaneous centre of rotation.

In the case of a carriage wheel, the instantaneous centre of rotation is the point which is in contact with the ground.

Let the circle D E F (Fig. 2) represent the carriage wheel, and let E be the point of contact with the ground, and X the middle of the axle. With the centre E and the radius E X describe the arc D X F cutting the rim at D and F. It is evident that

ED = EX = EF

But these lines respectively join the points D, X and F to E, the instantaneous centre of rotation of the wheel ∴ (by property (2) above) the velocities of D, X and F must be equal. ∴ D and F are the required points. (T. R.)

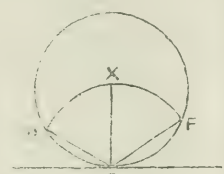

Fig. 2.

Notes.

A correspondent submits the following question and solution:

A straight bar of steel 40 inches in length, 1 inch broad, and $\frac{1}{10}$ inch in thickness, is bent into the form of a bow, having an elastic deflection of 2 inches in the middle, and the ends are united by the bowstring. Taking the modulus E at 29,000,000 lb., what will be the tension on the string? (A.M.I.C.E., Feb., 1901.)

Let y be the deflection at any point P, and I the least moment of inertia of the section.

Then since $\frac{M}{EI} = \frac{1}{R} = -\frac{d^2y}{dx^2}$

for flat arcs, and since $M = Fy$,

we have $\frac{Fy}{EI} = -\frac{d^2y}{dx^2}$

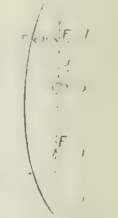
If we write this equation in the form

$$\frac{d^2y}{dx^2} + n^2y = 0, \quad \text{where } n^2 = \frac{F}{EI},$$

the general solution is

$$y = a\cos nx + b\sin nx,$$

where a and b are arbitrary constants. In the present case, $y = 0$ when $x = l$ and also when $x = -l$.



∴ $0 = a\cos nl + b\sin nl$ and $0 = a\cos nl - b\sin nl$,

whence $b = 0$, so that $y = a\cos nx$ is the solution required. Now when $x = 0$, $y = a$, so that a is the central deflection;

and $n = \sqrt{\frac{F}{EI}} = \sqrt{\frac{12F}{29000}}$ and $a = 2$ inches.

But $0 = a\cos nl$.

$$\therefore \quad 2\cos\sqrt{\frac{F \times 12}{29000}} \times 20 = 0$$

$$\therefore \left(\frac{\pi}{2}\right)^2 = 400 \cdot \frac{12F}{29000},$$

whence F = 112 lb.

Port of London Authority's New Offices. The plans of Mr. Edwin Cooper, 12 Gray's Inn-square, London, have been selected by the Port of London Authority on the advice of Sir Aston Webb, R.A., for the new offices about to be erected in Trinity-square, London, at a cost of £300,000.

Widening Putney Bridge. Fulham Borough Council have urged upon the London County Council the necessity in the interests of public safety for the existing footpaths of Putney Bridge to be incorporated with and form part of the carriageway, and the bridge widened for the purpose of constructing new footpaths.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Huddersfield T.C. (July 5th. Mr. A. A. G. Malet).—£15,500 for the extension of the sludge disposal works of the corporation at Cooper Bridge.—Mr. J. H. Field, town clerk, explained that the corporation had spent on the works and land at Cooper Bridge £164,137, and the sum now asked for would complete the works.

Plymouth T.C. (July 11th. Mr. Courtenay Clifton).—£800 and £2,000 for the provision of a bathing pool at the Reform Beach, and for the improvement of bathing facilities at Tinside Beach, as well as £980 for laying out the Mutley Park Estate as a pleasure ground, and constructing a roadway through the estate connecting Oxford-avenue with Mutley Park-road. Mr. C. H. Trounson (on behalf of the borough engineer, Mr. J. Paton) submitted and described the plans. They showed that the proposed pool at Reform Beach would be about 60 ft. in length, would average 33 ft. in width, and vary in depth from 7 ft. 6 in. to 11 ft. 6 in. They proposed to prolong the existing diving platform and to use the rocks as far as possible for the boundary terraces.

Wednesbury T.C. (June 25th. Mr. Courtenay Clifton).—£5,000 for the extension of the public offices and public baths, and £1,800 for the purchase of two pieces of land situated near the council schools, Holyhead-road, for purposes of open spaces or recreation grounds.—The town clerk, Mr. T. Jones, stated that for the large loan they asked for a period of thirty years, and for the £1,800 a period of sixty years. The works were all within the borough and complied with the by-laws. The plans had been before the committee and passed. The increase in the sum originally asked for was due to increase in cost of materials, and the fact that a new boiler was necessary at the baths. The accommodation at the town hall had been inadequate for a number of years past.

APPLICATIONS FOR LOANS.

Barnsley T.C. £1,000 for the purposes of the markets.

Briton Ferry U.D.C.—£16,000 for a housing scheme.

Chelmsford R.D.C.—£1,400 for the purchase of a site for a reservoir.

Dorchester T.C.—£3,263 for the construction of sewage disposal works.

Down C.C. £5,000 for the repair of Kirkcubbin and pier.

Edmonton U.D.C.—£6,800 for private street works.

Kensington B.C.—£1,760, further loan for the Church-street improvement.

Linton (Cambs) R.D.C.—£550 for building cottages.

Macroom R.D.C. £5,000 for a housing scheme.

New Forest R.D.C.—£800 for the proposed Lyndhurst improvement.

Northwich U.D.C.—£7,126 for public baths and £4,000 for workmen's dwellings.

Sudbury T.C.—£5,680 for industrial dwellings.

Sutton-in-Ashfield U.D.C.—£200 for public conveniences.

Swindon T.C.—£24,000 for the extension of the Rodbourne sewage works.

Woking U.D.C.—£4,500 for sewage works.

Yeovil T.C.—£1,225 for a new street.

LOANS SANCTIONED.

Chester-le-Street R.D.C.—£1,264 for street improvement works.

East Grinstead R.D.C.—£3,122 for the construction of sewage disposal works.

Esher and the Dittons U.D.C.—£6,094 for new tanks and filters at the sewage disposal works. The surveyor, M. H. C. Fread, is preparing the necessary contract plans, specifications and bills of quantities prior to advertising for tenders.

Hackney B.C.—£1,385 for an underground convenience.

Harwich T.C.—£655 for a fire station and fire appliances.

Jarrow T.C. £1,551 for public works.

Kettering U.D.C.—£3,000 for a school for delicate and phthisical children.

Leatherhead U.D.C.—£230 for street improvement purposes.

Merthyr T.C.—£1,197 for a site for a recreation ground and £456 for laying out, £111 for street improvements, and £6,384 for road work.

Midhurst R.D.C.—£1,650 for water supply works.

FORTHCOMING INQUIRIES.

JULY.

International Fire Conference and Exhibition.—The first international conference and exhibition, embracing every phase of fire prevention, fire protection and fire fighting, will be held at Madison-square-gardens, New York, from October 2nd to October 12th. Fireproof building construction and all accessories, fire-alarm systems, automatic sprinklers and fire extinguishers, motor fire engines, fire escapes, and, in fact, every device and manufacture in the fields of fire prevention and extinguishment will be exhibited and demonstrated, and, in addition, an important conference will hold sessions daily for the general consideration of the fire question by architects, builders, engineers, insurance men and fire chiefs and fire fighters on the same platform. Mr. A. D. V Storey, 1269 Broadway, New York City, is the secretary and manager.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Lostwithiel, Maldens and Coombe, Monmouthshire, Wallasey £94,000, Yarmouth; housing and town planning—Newquay; refuse collection and disposal—Maldens and Coombe; roads and materials—Croydon, Southgate £5,000, Twickenham; sewerage and sewage disposal—Cattbridge £38,656, Nantwich £12,500, water, gas and electricity Blackburn. Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Hackney B.C.—It has been agreed to appoint a Leaders Committee, to consist of the chairman of each Standing Committee and eight other members, to open tenders in public prior to the council meetings in order to prevent the delay which now takes place.

Maldens and Coombe U.D.C.—Application is to be made to the Local Government Board for modern by-laws for the better regulation of combined drainage and other matters connected therewith, and the surveyor, Mr. R. H. Jeffes, has been asked to prepare draft by-laws embodying the following general principles: (*a*) All combined drains to be laid in iron, with lead joints; (*b*) not more than four houses to be connected to any one combined drain; (*c*) a fall of 1 in 50 to be insisted on; (*d*) manholes to be placed at every change of direction and where required; sound, hard bricks to be used in the construction thereof.

Watford U.D.C.—A scheme for the rearrangement of the surveyor's department has been adopted. A highway surveyor is to be appointed, and the services of Mr. Fayers retained as building surveyor, with the duty of preparing all quantities as required by any department of the council.

BUILDINGS.

Antrim C.C.—A proposal to rebuild the jetty at Red Bay pier with greenheart piles and bracing, and pitch-pine flooring, at a cost of £1,800, has been referred to the Piers and Harbours Committee.

Erixham (Devon) U.D.C.—The surveyor, Mr. J. Silley, has been instructed to prepare specifications and invite tenders for an additional wood-piled landing stage near the passenger landing stage, at a cost of £232, as well as the renewal of piles in various positions at the pier.

Leek U.D.C.—The tender of Mr. Sampson Salt, at £900, has been accepted for the building of new offices at the gas works.

Llandyssul R.D.C.—A bridge is to be constructed over the river Ceri at Cwmdu, near Newcastle Emlyn, at a cost of £130, one-third of which will be contributed by the Cardigan County Council.

Lostwithiel T.C.—It has been agreed to support the proposal to provide a joint isolation hospital for the district, comprising the Bodmin Rural and Urban, Wadebridge Urban and Lostwithiel Urban areas.

Maldens and Coombe U.D.C.—The surveyor, Mr. R. H. Jeffes, is to report upon the possibility of adapting for municipal and public hall purposes certain land and buildings adjoining the present offices of the council.

Monmouthshire C.C.—The tender of Mr. W. A. Linton, of Newport, at £5,397, has been accepted for [illegible] and extensions of the county [illegible] at Newport.

Montrose T.C.—The plans of the burgh surveyor, Mr. S. L. Cruickshank, for the new Trail shelter to be erected on the beach at an estimated cost of £600 has been approved.

Newcastle-upon-Tyne T.C.—It has been decided to accept the offer to build a new city hall on the site of the Northumberland baths, the approximate cost being estimated at £100,000. The proposal also includes the baths to be there re-erected and built to a smaller size, £4,000 and £800, as well as other rooms.

Wallasey T.C.—The Works Committee recommend the acceptance of the plans of Messrs. Briggs & Thornely, assistants to the late Mr. Owen Owen, for the proposed new town hall. The building is estimated to cost £94,000.

Winchester T.C.—The tender of Mr. J. Hunt, at £1,079, has been accepted for the construction of a bandstand, shelter, lodge and public conveniences at the North Walls Recreation Ground.

Yarmouth T.C.—A scheme is in course of preparation for the provision of a new Haven Bridge.

HOUSING AND TOWN PLANNING.

Bridlington R.D.C.—It has been decided to co-operate with the Bridlington Corporation in the preparation of a town planning scheme.

Newquay U.D.C.—The question of providing workmen's dwellings is to be considered by a committee of the council.

Stratford-on-Avon T.C.—The tender of Messrs. T. Barker & Sons, of Loughborough, at £3,495, has been accepted for the erection of twenty-four cottages.

Twickenham U.D.C.—It has been agreed to make application to the Local Government Board to prepare a town planning scheme, in accordance with the plan prepared by Mr. F. W. Pearce, the surveyor to the council.

PARKS AND OPEN SPACES.

Newcastle-upon-Tyne T.C.—A scheme is being considered for the provision of a recreation ground, at an estimated cost of £7,500.

REFUSE COLLECTION AND DISPOSAL.

Lowestoft T.C.—The council have agreed to undertake the work of refuse removal themselves at the expiry of the present contract.

Maldens and Coombe U.D.C.—At a future meeting consideration will be given to a suggestion of Mr. H. Hunter, the sanitary inspector, that a small trade refuse destructor be obtained in view of the difficulty of disposing of fish offal, garbage and the like.

Tiverton T.C.—Mr. A. J. Milden, of Ash Thomas, has agreed to take the refuse of the town for five years to fill up a quarry on his farm, and Mr. Elworthy, also of Ash Thomas, will provide wagons to take the refuse away by traction power for £100 a year.

ROADS AND MATERIALS.

Broadstairs U.D.C.—Tenders are to be obtained for works of granite kerbing and channelling.

Bushey U.D.C.—The tender of Messrs. Bailey & Son, at £415, has been accepted for making up Windmill-street.

Croydon T.C.—A scheme is under consideration for the widening of North-end and an improvement of the junction with George-street, at an estimated cost of £120,000.

Derbyshire C.C.—It has been agreed that 20s. per week be the minimum rate of wages for the council's adult roadmen and labourers when full time is made, and that no workman shall be dismissed in consequence of the passing of the resolution.

Dudley T.C.—It is intended to spend £825 in erecting premises for the preparation of tar-macadam.

Exeter T.C.—Property to the value of £3,051 has been purchased in Bartholomew-street West for street improvement purposes.

Kingstown (Co. Dublin) U.D.C.—The tender of Messrs. Stansbury & Banks at £2,215, has been accepted for tar-macadam work along the sea front.

Maldens and Coombe U.D.C.—Plans and estimates are to be prepared for making up part of Duke's-avenue under the Private Street Works Act. A small deputation is to be appointed to meet the chairman of the Highways and Bridges Committee of the Surrey County Council to discuss the plans for the Road Board's scheme for a suggested loop road from Kingston vale to Esher.

Marylebone B.C.—The Baker-street improvement scheme is to be carried out without delay.

Porthcawl U.D.C.—The road constructed by the Council at Porthcawl over the Lock's Common leading to the pier for the convenience of motorists has been completed.

Southwark B.C. A sum of £5,000 is to be allocated to the Works Committee for the purpose of improving the roads of the borough.

Swansea T.C.—A plan has been drawn up by the surveyor, Mr. G. Bell, for planting 2,900 trees in the streets, at a cost of £1,812.

Twickenham U.D.C.—Mr. F. W. Pearce, the surveyor, has been asked to prepare a report and estimates as to the substitution of wood block or other suitable paving for the present granite macadam in portions of St. Margaret's-road, in view of the motor-omnibus traffic.

Ware U.D.C. It is proposed to widen Star-street at an estimated cost of £3,011.

SEWERAGE AND SEWAGE DISPOSAL.

Barnsley T.C.—New surface-water drains are to be constructed at a cost of £200.

Blean R.D.C.—The tender of Mr. A. S. Ingleton, at £10,997, has been accepted for contract No. 1 of the Herne and Reculver drainage works.

Coatbridge T.C.—A new sewerage scheme, estimated to cost £38,656, has been approved.

Grimsby T.C.—The stream at the rear of Roperystreet is to be culverted at a cost of £5,900.

Nantwich R.D.C. The construction of new sewage works is to be proceeded with at an estimated cost of £12,500.

Norwich T.C.—The Sewerage and Irrigation Committee report that they have further considered the scheme as to the sewerage of Earlham-road (part of) and Gipsy-lane, at an estimated cost of £5,800, but now make no recommendation thereon, the committee being of opinion that that part of the city has not yet sufficiently developed to justify the expenditure. The estimated cost of the sewerage of Thorpe-road from Carrow-road to the boundary of the city at Harvey-lane and the district south thereof was £5 915, and the actual expenditure has been £4.377, the saving of £1,538 being due to the utilisation of considerable lengths of the old combined sewer in Thorpe-road, and the purchase of a large number of concrete tubes at a low figure.

WATER, GAS, AND ELECTRICITY.

Abersychan (Mon.) U.D.C.—The surveyor, Mr. E. Whitwell, has prepared a lighting scheme, which the council are considering.

Blackburn T.C.—The tender of Messrs. R. McAlpine & Sons, of Glasgow, has been accepted for the construction of the new reservoir at Wilpshire.

Cottingham U.D.C.—The tender of Mr. W. Whiting, at £795, has been accepted for water mains extensions.

Coventry T.C.—The tender of Messrs. E. C. & J. Keay, Limited, of West Bromwich, at £1,707, has been accepted for the erection of a roof over the new gas-purifiers at Foleshill.

Dunmow R.D.C.—The Dunmow waterworks undertaking is to be acquired by the council for £2,500.

Perth C.C.—The Perth District Committee have decided to raise the embankment of the Errol water dam at an estimated cost of £1,000.

Rothesay T.C.—The gas manager has received instructions to prepare specifications for a new gasometer with a capacity of 300 000 cub. ft.

Stepney B.C.—A proposal has been made for the extension of the electricity supply undertaking at a cost of £137,750. The accounts of the undertaking for the year ended March 31st show a surplus carried to net revenue account of £38,196, as compared with £24,105 in the previous year. This surplus represents a gross profit of 9¾ per cent on the capital employed.

Teignmouth U.D.C. There has been a net profit on the working of the gas undertaking last year of £353.

Truro R.D.C.—The tender of Mr. W. E. Bennett, of Bodmin, at £2,637, has been accepted for the construction of the Perranporth waterworks.

Wolverhampton T.C. A profit of £6,000 was carried to the electricity undertaking last year.

MISCELLANEOUS.

Esher and the Dittons U.D.C.—The tender of Messrs. Rose has been accepted for six new lengths of the horse path competing for the Claygate Brigade, the estimated cost being about £15.

PERSONAL.

Mr. R. J. Stevenson, assistant surveyor to the Filey Urban District Council, has resigned, and Mr. R. M. Robson, the surveyor, will now undertake all the duties of the office.

Mr. E. Southall Moule, assistant surveyor to the Redditch Urban District Council, has been appointed assistant in the engineer and surveyor's department of the borough of Luton.

Messrs. J. Parry, M.INST.C.E., water engineer to the Corporation of Liverpool, and G. Swarbrick, deputy borough surveyor of Swansea, have been elected members of the Royal Sanitary Institute.

Mr. S. C. Lloyd, who has for some years held the appointment of district surveyor under the West Sussex County Council, has been successful in obtaining an appointment under the East Suffolk County Council.

Mr. George Smith, of the borough surveyor's office, Luton, has been appointed as assistant to Mr. H. C. Fread, the surveyor to the Esher and the Dittons Urban District Council. There were eighty-eight applicants for the post.

Mr. Frederick Robert Ryman, borough engineer and surveyor of Stamford, was married last week, at the parish church of Tinwell, near Stamford, to Miss M. Bradshaw, only daughter of Mr. and Mrs. J. T. Bradshaw, of Tinwell. Mr. W. B. Purser, surveyor to the Kesteven (Lincs) County Council, acted as best man.

Mr. W. Rees Jeffreys, Secretary to H.M. Road Board, was entertained at Toronto at dinner on June 26th by the Ontario Motor League, Mr. W. A. McLean, Provincial Engineer of Highways, proposing the toast of "Our Guest." In the course of an interesting address, Mr. Rees Jeffreys dealt at length with the highways of England.

Mr. Willis Glossop, surveyor to the Newbold Urban District Council, sent in his resignation at the June meeting of the council, and last week the following motion was carried:—"That Mr. Glossop be asked to reconsider his resignation, and that should he do so the council will increase his salary to such an amount as will make it worth his while to retain his appointment."

Mr. L. M. Jones, the city engineer of Port Arthur, Ontario, was born at Dowlais, Wales, and was educated at Cardiff. His professional career commenced in 1899, when he became identified with the Canadian Pacific Railway construction at Winnipeg. After gathering further engineering experience, he was in 1906 appointed assistant city engineer of Port Arthur, a position he retained until 1909, when he accepted a post with Messrs. Smith, Kerry, & Chace, of Toronto. He returned to his former office at Port Arthur in 1910, and in June of last year was elected to the chief appointment there.

Mr. R. O. Wynne-Roberts, M.INST.C.E., has been invited by the Provincial Government of Saskatchewan to investigate the question of utilising the lignite coalfields of that province for power, gas, and other purposes. In accepting this offer, Mr. Wynne-Roberts will not entirely sever his connection with the city of Regina—by whom, as our readers are aware, he has been retained in connection with water supply matters—but will continue to act as consulting engineer for the work of extension at Boggy Creek. His decision to take up the work referred to was received with considerable regret by the Water Committee, but the greatest satisfaction was expressed with the manner in which he has served the city since his arrival from England. To quote the Regina *Morning Leader*, "Mr. Wynne-Roberts may be said to have solved Regina's water problem for many years to come, and little doubt is entertained of his being able successfully to tackle the big proposition now set before him by the Government, the solution of which it is by everyone admitted will be of incalculable value to Regina, Moose Jaw, and the towns of Southern Saskatchewan." His new task is by no means a light one, for his investigation will entail the inspection of a territory measuring, roughly speaking, about 600 square miles.

In last week's issue there appeared a brief outline of the career of Mr. R. J. Thomas, county surveyor,

Buckinghamshire, the new president of the Institution of Municipal and County Engineers. In the interval we have been able to obtain a more detailed account of his life and work, which, we are sure, will be read with interest by the members of the important body for the direction of whose affairs he will be responsible during the ensuing twelve months. Mr. Thomas was educated at the Grammar-school, Carnarvon, at Towyn, and at the University College of Wales, Aberystwyth. He was articled to his father, the late Mr. J. Thomas, county surveyor of Carnarvonshire. After holding minor appointments at Croydon, Salisbury, and Carlisle, he was appointed engineer-in-charge of the restoration of the Shrewsbury and Holyhead road when that highway was transferred to the county of Carnarvon from the Turnpike Trust in 1886. He obtained the testamur of the institution in the autumn of 1886, this materially assisting him in his successful application for the appointment of county surveyor, then vacant and advertised in consequence of the death of his father. He prepared and organised the direct system of maintenance of all rural main roads in the county for the newly established county council (1889), and received the council's thanks and a handsome honorarium for the success of this system upon securing the appointment of county surveyor of Buckinghamshire in 1890. Mr. Thomas developed the system of direct maintenance in Bucks, where the main roads now exceed 500 miles in extent, and organised the county council's extensive scheme for contributions to district highways. He has built numerous county bridges in various materials, erected court-houses, police-buildings, and carried out extensions to the lunatic asylum costing £70,000. During the past eight or nine years he has used extensively various bituminously bound materials upon important trunk roads traversing the county, and has tar-painted a large number of slightly less important roads. Mr. Thomas has travelled and studied the road question in the United States, Canada, and Europe, and has attended road congresses as a delegate, and contributed papers to them in these countries as well as in the United Kingdom. He obtained the Bessemer premium of the Society of Engineers for a paper on "Road Construction and Maintenance." He is chairman of a committee charged with the preparation of a paper for the International Road Congress, 1913, embodying the latest English practice in bituminous road construction. Mr. Thomas is a member of a committee appointed by the Board of Trade for dealing with British engineering at the Brussels and Turin Exhibitions, is a member of the Institution of Civil Engineers, and a past-president of the County Surveyors' Society. He was elected hon. secretary for the home district of the Institution of Municipal and County Engineers with a seat on the council in 1899, was appointed member of the Examining Board in 1901, and became a vice-president in 1910.

FOR OTHER ADVERTISEMENTS

See End of Paper.

TEDDINGTON URBAN DISTRICT COUNCIL.

ROAD CONTRACTORS AND TAR-PAVIORS.

The above-named Council are desirous of receiving Tenders for the following Works in connection with the Making-up of Blackmore's-grove and Claremont-road, Teddington, under the Private Street Works Act, 1892:

935 Lineal Yards of 12-in. by 6-in. Norwegian Granite Kerb and Laying.

961 Lineal Yards of Tees Scoriæ Setts Channel and Laying.

3,690 Square Yards of Road Formation.

2,191 Square Yards of Tar-paving.

Plans and Specifications may be seen, particulars and Forms of Tender obtained, on application to Mr. Marshall Hainsworth, Surveyor, Council Offices, Teddington.

Sealed Tenders, endorsed "Street Works" must be delivered to the undersigned not later than Saturday, the 3rd day of August next.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
G. H. SALMONS,
Clerk.

Council Offices, Teddington.
11th July 1912.

CANNOCK URBAN DISTRICT COUNCIL.

WASHING BACTERIA BED MEDIUM.

The Cannock Urban District Council invite Tenders for the Excavating, Removal, Washing and Replacing of Filtering Material in Bacteria Bed, &c., at their Sewage Farm, Longford-lane, Cannock.

Specification, Schedule, and Form of Tender may be obtained on application to Mr. Robt. Blanchard, Engineer and Surveyor, at the Council Offices, Cannock.

Sealed Tenders, endorsed "Tender for Washing Filtering Material," and addressed to the Chairman of the Sewage Farm Committee at the Council Offices, Cannock, are to be delivered not later than 10 a.m. on Friday, the 2nd day of August, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

C. A. LOXTON,
Clerk to the Council.

Council Offices, Cannock.
June 19, 1912.

BOROUGH OF LOUGHBOROUGH.

WATERWORKS DEPARTMENT.

APPOINTMENT OF TWO WATERWORKS INSPECTORS.

The Corporation require the services of an experienced Chief Waterworks Inspector. Candidates must be qualified plumbers, thoroughly practical, and accustomed to the use of waste water meters. Salary 38s. per week and uniform.

The Corporation also require the services of an Assistant Waterworks Inspector, who must be a qualified, practical plumber, experienced in service work and meter reading. Salary 32s. per week and uniform.

Applications in candidate's own handwriting, accompanied by copies of not more than three recent testimonials as to character and abilities, to be forwarded to me not later than noon on Thursday, the 1st August next.

ALBERT H. WALKER, Assoc.M.Inst.C.E.,
Borough Surveyor and Waterworks Engineer.

Town Hall, Loughborough.
July 17th, 1912.

RURAL DISTRICT COUNCIL OF SEDGEFIELD.

ASSISTANT SANITARY SURVEYOR.

The above Council invite applications for the position of Assistant Sanitary Surveyor. Salary £2 per week.

Candidates must be good draughtsmen, accurate surveyors and levellers, be able to prepare estimates and take off quantities and to have had experience in the carrying out of sewage disposal works and private street works.

Applications, in candidate's handwriting, stating age and experience, together with copies of two recent testimonials, to reach me, the undersigned, not later than Wednesday, the 24th inst., at 5 p.m.

(By order)
J. W. LODGE,
Clerk to the Council.

Union Offices,
Sedgefield, Ferryhill,
17th July, 1912.

CITY OF BRADFORD.

ESHOLT SEWAGE DISPOSAL WORKS.

SLUDGE FILTER PRESSES, CONTRACT NO. 22.

The Corporation are prepared to receive Tenders for the supply, delivery, and erection of 28 Sludge Filter Presses at their Esholt Sewage Disposal Works.

Further Particulars and Copy of Specification may be obtained at the Office of Mr. Joseph Garfield, Assoc.M.Inst.C.E., Sewage Works Engineer, Bradford.

The Contract will be let subject to the fair contracts clauses of the Corporation, which may be seen at the Engineer's Office, and which the accepted contractor will be required to sign.

Sealed Tenders, endorsed "Esholt Sewage Disposal Works, Contract No. 22," must be delivered at the Office of the undersigned not later than 10 a.m., 3rd September, 1912.

The Corporation do not bind themselves to accept the lowest or any Tender.

FREDERICK STEVENS,
Town Clerk.

Town Hall, Bradford.
July 16, 1912.

Institution of Water Engineers.

SUMMER GENERAL MEETING AT CHELTENHAM.

(*Conclusion.*)

Among the contributions at the recent summer general meeting of the Institution of Water Engineers at Cheltenham was a paper by Mr. L. Richardson, F.R.S.E., F.L.S., F.G.S., entitled

THE GEOLOGY OF CHELTENHAM, WITH SPECIAL REFERENCE TO THE WATER SUPPLY.

In his paper Mr. RICHARDSON endeavoured to make it clear that towns situated on the lower lias at the foot of hills composed of rocks which dip away from those towns, and which also constitute divides between great river systems, must go some distance afield in order to secure a continuous adequate supply of water. Cheltenham, he pointed out, had had to draw upon the Severn at Tewkesbury, and Gloucester had resorted to the abundant supply contained in the triassic sandstones of the Newent district. A boring that had recently come under his notice was the means of furnishing some very instructive information. Firstly, it emphasised the extreme toughness of the lower lias limestones; secondly, it proved the great thickness in this district of the limestones and clays which make up the lower portion of the lower lias; and, thirdly, it revealed the salinity of the waters. He was now inclined to think that the Cheltenham mineral waters after all had not so deep-seated an origin as it had been customary to suppose; that, instead of being derived from the Keuper, they came solely from the lower lias. One of the principal water horizons in that part of Gloucestershire was that where the relatively impervious lower lias clays met with the succeeding sandy clays of the middle lias. The sandy beds were easy to locate. In ascending the lower portion of the hill slope, damp ground would be noticed followed by dry soil with a wealth of gorse bushes. Above the slope marked by gorse bushes would usually be found flat ground, originated by the hard marlstone. Water falling upon the porous ground sank in, and, as the prevalent dip was in a south-easterly direction, soon disappeared, travelling in that direction. Consequently, if a comparatively small supply of water were desired from that source, the further up the hill slope the well sinker went the better; but, of course, the well had to be deeper. A number of springs also issued from the neighbourhood of the marlstone. As that contains a considerable amount of iron (not, however, in sufficient quantity in Gloucestershire to work commercially), the water was usually very ferruginous. Such highly coloured water might be observed at a spring above Woodmancote and at another near Prinknash, while the name "Red Well" for a spring at Matson, near Gloucester, explained itself. The principal horizon from which water issues in the district was from the top of the upper lias clays, that was from the base of the porous overlying Cotswold sands or inferior oolite limestones. The prevalent dip of the inferior oolite beds was again to the south-east, but the beds were much faulted. Also the hill masses, over the whole of which these inferior oolite beds were originally continuous, had been much dissected by the backward growth of tributaries of the river Severn. Some head waters which once were contributed to the Thames had been diverted to the Severn. But, in spite of this, it had been a considerable drawback to towns and villages at or near the foot of the Cotswold Hills that the dip of the beds had been away from them. If it had not been for the little valleys produced by the headward growth of the Severn tributaries and faults, such towns and villages would have been at one period very badly off. The river Chelt, which contributed most of the water that was stored in the Dowdeswell reservoir, derived its main supply from this horizon.

Mr. H. PRESTON (Grantham) said he would like to know the reason for the highly coloured water which had been observed at certain springs by Mr. Richardson. They had heard of this having occurred in the Gloucester reservoirs, and he asked whether it was considered there was any connection between the two, or whether it was simply precipitation of the iron oxide in the water. The author of the paper was inclined to think the Cheltenham mineral waters came solely from the lower lias; in Lincolnshire they usually found saline water in that formation. He had read the paper with extreme interest, particularly as it referred to rocks with which he was most acquainted in his own county, and it was gratifying to have had such a contribution before the meeting.

Mr. R. READ (Gloucester) stated that there were similar mineral waters to those of Cheltenham at Gloucester, and they undoubtedly came out of partings in the lower lias clay. There were beds of nodules of stone 4 in. or 5 in. in thickness, and these produced the water.

Mr. GEORGE EMBREY (Gloucester) said he could bear out what Mr. Preston had said. The clay in that part of the country yielded water in all directions, but the water from every well was different in character.

Mr. RICHARDSON, in reply, stated that the red colour of the water was, of course, due to oxide of iron. One point to which he wished to refer was the practice which he had made of keeping a careful record of all borings that were put down in the district, his opinion being that it was very desirable that these should be available for reference. He thought it would be very convenient if the record of every deep boring made were included in the "Proceedings" of the Institution of Water Engineers; it would then be an easy matter to obtain information when it was required.

WATER REGULATIONS COMMITTEE'S REPORT.

In the course of the recent meeting of the Institution of Water Engineers a report on the work of the Incorporated Joint Committee on Water Regulations, prepared by Mr. F. J. Bancroft (Barnet), one of the representatives of the institution on the committee, was submitted by the president, Mr. J. S. Pickering. The report was as follows:—

"In the year 1908 the Joint Committee issued a model code of water regulations, attached to which were appendices containing standard specifications of various water fittings in common use, and extracts from General Water Acts relative to the waste and misuse of public water supplies. On this occasion the committee were unable to guarantee that the Local Government Board would sanction the adoption of the model code by those water authorities who were dependent upon the sanction of the board for the regulations. Several corporations and companies, who were empowered by their private Acts to issue regulations and by-laws independently of the Local Government Board, adopted the model code *in extenso*; while many other water authorities submitted the code to the board for their approval—for the moment, however, without success.

"The incorporation of the Joint Committee, the registration of a 'standardisation mark' (under regulations approved by the Board of Trade) for use on fittings constructed in accordance with the standard specifications, and conferences between representatives of the committee and the Local Government Board officials, contributed to the strengthening of the position of the committee, and the removal of the board's objections to the model code. Thus in the course of last year the board issued a revised edition of their own 'Model By-laws,' which in many vital points showed that the recommendations of the committee had been adopted. In connection with this the board issued a preface, in which the work of the committee and the assistance rendered by the Institution of Water Engineers and other bodies were fully recognised; moreover, the board clearly indicated the possibility of water authorities publishing officially, in the form of 'Conditions of Supply,' annexed to water regulations, such parts of the model code as could not for the moment be accepted by them as by-laws subject to legal penalties for breach.

"The committee have now prepared in pamphlet form—(1) the Model By-laws issued by the Local Government Board, (2) those issued by the committee revised to date, and (3) supplemental conditions of supply which it is proposed should be adopted, as far as they may apply, by water authorities, and issued as an appendix to the statutory by-laws approved by the Local Government Board. This pamphlet will shortly be supplied gratuitously to all members of the institution in charge of water undertakings; and

it is hoped that, as a result, a large number of water authorities will now adopt a uniform code of water regulations.

"The institution is represented on the Joint Committee, not only by the two delegates specifically appointed by the council (Mr. F. J. Bancroft and Mr. Frederick Griffith), but by fifteen other members appointed by their respective water authorities; so that of the forty-eight members of the committee, seventeen, or more than 35 per cent, are members of the institution. The council feel every confidence, therefore, in commending the work of the committee to all the members, and in urging them to assist as much as possible in securing uniformity of practice in so important a matter as that of water regulation for preventing the waste, undue consumption, misuse, or contamination of public water supplies."

DUST PREVENTION IN FRANCE.

According to a statement by Consul William H. Hunt, of St. Etienne, France, a report has been made to the French Academy of Science drawing attention to the detrimental effect on the eyes of the dust arising from tarred roads.

In an experiment made to determine the nature of this effect, mixtures were made up consisting of fine road dust and tar in varying proportions and the eyes of rabbits were dusted with the mixtures. Results showed that while the pure road dust had little or no effect on the rabbits, their eyes were greatly affected by the presence of tar, and serious diseases broke out after the application, showing its noxious effect.

The report to the academy states that tar produces good results only if the roads are well built and kept in good repair, and are composed of sufficiently hard material, if the tar fully penetrates the crevices and does not form a merely external crust, which the first winter rains raise up and form into mud, and if the drying conditions during the dry season are satisfactory. Under these conditions, the report states, it may be said that tar effectively protects the surfaces of highways against motor-car traffic and against ordinary traffic if it is not extraordinarily heavy.

The use of superficial tarring is becoming more and more extended in the neighbourhood of Paris. In the St. Etienne district, and other parts of provincial France, progress has been slower except near a few large industrial centres. The appropriations allowed for experiments in tar roads in 1909 amounted to £3,815, covering 106 kilometers of roads.

In the department of Loire the tar is spread hot by hand or by spraying. Another method of application consists of rendering cold tar fluid by the addition of 10 per cent crude oil and spreading it by the same means and the same manner as hot tar. In the department of Seine et Oise recent experiments have been made with various tar and oil emulsions. Deliquescent salts were found to be of shorter duration, so that they can be applied only for special occasions, such as fêtes, races, &c. This department each year uses solutions of calcium chloride for watering certain sections of the roads which are not in sufficiently good condition to receive a coat of tar. The cost of this process is about 1d. per square metre.

But few experiments have been made in France with crude petroleum on account of the high cost and the inconvenience of the mud which appears with the autumn rains.—From the *Contract Record* (Toronto).

An Opportunity for Assistants and Town-planning Experience.—In our last issue (p. 75) we referred under this heading to opportunities for "good third-year municipal engineer's pupils," and for anyone seeking practical experience in town planning. We have received a number of applications, and have forwarded them to the Assoc.M.Inst.C.E., who will make the appointments, but, as the matter is not yet closed, we shall be pleased to forward any further applications that arrive in response to this second announcement. All communications should be addressed to the Editor of The Surveyor, and their envelopes should be marked "Appointment." We may add that the work offered will be carried out in a district distinctly attractive for its healthy and beautiful surroundings, and under a chief whose training should be invaluable, and whose name will carry great weight as a recommendation for future appointments. The schemes in hand cover 11½ square miles, and provide for an increase in population of at least 35,000 in three and a-half years.

SOME RECENT PUBLICATIONS.*

The Sewerage Engineer's Pocket-book (in German). By Dr.-Ing. K. Imhoff. Price 2·80 marks. Munich: R. Oldenburg.

This little book contains in a small compass a large amount of valuable information and suggestions for engineers engaged in preparing schemes of sewerage and sewage disposal. In addition to the suggestions upon the points to be observed, a large number of valuable diagram curves, showing the flow of water in sewers of various sections, including some not in general use, are given. Examples are given of the methods of calculating the sewers in accordance with German practice, and the book is well worthy of study by English engineers.

Problems in Engineering, with Solutions. Edited by Sydney G. Turner, Assoc.M.Inst.C.E. Price 5s. nett. London: St. Bride's Press, Limited.

In this volume are collected about 130 of the most useful problems which have appeared in the "Assistants' and Students' Section" of The Surveyor, together with solutions. They are classified under ten headings, according to the subject-matter, and the volume forms a handy note-book in such subjects as mechanics, strength of materials, water supply, sewerage and sewage disposal, and many others. The fact that each question contained in the volume deals with a point which has caused difficulty to the original inquirer is proof that the book will be of great use in the elucidation of knotty points in daily practice. Published in response to repeated requests from readers of the "Assistants' and Students' Section," the book will be found useful not only to those for whom that feature of The Surveyor is specially meant, but also to many older members of the profession.

The Main Drainage of Towns. By Noel F. Taylor, C.E., M.I.Mun.E. Price 12s. 6d. nett. London: Chas. Griffin & Co., Limited.

The term "main drainage" is usually applied to the main sewers only of a town, and if this definition is accepted, the title of Mr. Noel Taylor's book is, in a degree, misleading, seeing that it deals with sewers of all sizes, their construction and ventilation, the principles of hydraulics and hydrostatics, house drainage, the pumping of sewage, the theoretical consideration of sewage disposal, and the design and construction of sewage disposal works. A large number of books dealing with main drainage and sewerage alone have been produced in the past. Others deal with sewage disposal by itself, and in both cases volumes of considerable size have been necessary in order to deal with the subjects fully, and even then much more space might have been given with advantage to the further treatment of the subject.

In the present case the author has attempted to deal in detail, in 161 pages, with main drainage proper, including the principles of hydraulics and hydrostatics, thirty pages being devoted to the pumping of sewage, twenty-three to house drainage, nineteen to the theory of sewage disposal, and forty-eight to sewage disposal works. It is clear that, under these restrictions, the author has set himself a most difficult, if not impossible, task—*viz.*, to deal in full detail with his various subjects, and at the same time to avoid confusion. He has made a worthy attempt to compress within small limits an enormous amount of information, including elaborate illustrations, diagrams, mathematical calculations, tables, and chemical and bacteriological work. A book of this kind, which contains in so small a space so large an amount of matter, must obviously require the most careful correction and checking, and the work of editing it properly would be a severe task. This attention does not appear to have been given.

It is possible that one may obtain an incorrect impression on first examining the book, but an unfavourable impression is created by the preliminary study, when one finds ungrammatical, vague, or incorrect statements, such as the following: "Concrete" is the term applied to all mixtures of a semi-liquid state used in building construction which have the property of hardening . . . the aggregate is best made from porous material . . . the proportions of concrete vary, but the usual one is 6–1 sand, plus gravel and the best Portland cement." Such sentences as these show careless correction of the proofs. Again, such a statement as "Opinions regarding the manurial value of sewage are very complicated and probably much over-estimated" reminds one of Mark Twain's remark

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

to the effect that the report of his death had been very much exaggerated. Again, we are told that "General Scott sought to make cement from sludge precipitated by lime and clay, which it failed to do in sufficient quantity or of a quality to prove of any monetary value." We are also told "the awful forms" of certain appliances in common use "is incredible."

These are, after all, chiefly errors in composition but at the same time they show carelessness, and the reader at once becomes suspicious as to the accuracy of the rest of the work. On the other hand, the author has certainly presented a number of sketches and designs which may be of considerable service; the book represents an enormous amount of labour, and it would be ungrateful not to acknowledge the trouble taken. The book will certainly be useful to engineers who have sufficient experience to enable them to discriminate between right and wrong, but it is impossible to speak with unqualified approval of a scientific book the English of which is so faulty as to render the sense of the text obscure, neither is it possible to place absolute reliance upon the accuracy of the work, to the editing of which insufficient attention has been given. "The Main Drainage of Towns" contains material for a good and useful book, but it has been presented by the publishers without the usual corrections and revision being made. The grammatical errors should at least have been set right by the publishers' reader.

Junior Institution of Engineers.—About 100 members of the Junior Institution of Engineers recently paid a visit to the works of the Marconi Wireless Telegraph Company at Chelmsford.—On the 27th inst. a visit will be paid to the Chingford reservoir and pumping station.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. THOMAS, M.INST.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th 11th and 12th of that month.

COUNCIL MEETING.

At a council meeting held at Caxton Hall, Westminster, S.W., on Thursday, July 11, 1912, there were present: Messrs. A. D. Greatorex (outgoing president in the chair), R. J. Thomas (incoming president), Sir James Lemon (hon. treasurer), T. W. A. Hayward, G. F. Carter, E. B. Martin, J. W. Cockrill, E. J. Elford J. S. Pickering, T. W. Stainthorpe, H. T. Wakelam, W. H. Prescott, O. E. Winter, W. T. Lancashire, W. Stubbs, J. S. Brodie, W. N. Blair, W. Harpur, W. Jones, E. P. Hooley, G. A. Phillips, J. L. Redfern, E. R. Matthews, N. Scorgie, A. H. Campbell, Thomas Cole (secretary), and H. A. Giles (assistant secretary).

The following gentlemen were:

Elected as Members: Messrs. R. G. Gurney, surveyor, Ledbury Urban District Council; J. G. Matthew, deputy surveyor, Exmouth Urban District Council; A. D. Barron, deputy borough engineer, Douglas; W. Bennett, executive engineer, Public Works Department Rangoon; S. R. Drake surveyor, Leatherhead Urban District Council; J. H. Walters, borough surveyor, Congleton; S. Palmer, borough surveyor, St. Ives; J. B. Nuttall, borough surveyor, Heywood; P. Sinclair, burgh surveyor, Carnoustie; J. Gorman, State engineer to the Government of Kedah, Malay States; H. Holmes, borough surveyor, Ossett; and R. Robertson, county road surveyor, Inverness.

Elected as Associate Members: Messrs. A. D. Scott, engineering assistant, Barrow-in-Furness; W. H. Duckworth, engineering assistant, Watford Urban District Council; S. J. Kirby, engineering assistant, Batley; and S. F. Hopley, assistant surveyor, Bedwellty Urban District Council.

Transfer Associate Member to Member: Mr. H. E. Goldsmith, chief assistant, Public Works Department, Hong Kong.

Elected as Students: Messrs. R. A. Adamson, Chiswick; W. A. Walker, Stourbridge; and C. F. Hodson, Lincoln.

(By order of the Council)

THOMAS COLE, *Secretary.*

11 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. STICKLAND, ASSOC.M.INST.C.E., Borough Surveyor, Windsor.

NORTH-WESTERN DISTRICT MEETING AT CLITHEROE.

A meeting of the Institution of Municipal Engineers will be held on Saturday, July 27th, at Clitheroe.

PROGRAMME.

10.15 a.m.—Meet at Clitheroe Station and proceed on a round of visits to the following works:—
(1) Isis Cement Company's cement works.
(2) Horrocksford Lime Company's tar-macadam works.
(3) Messrs. R. Briggs & Son's stone quarries.
(4) Messrs. J. Carter & Company's stone quarries and tar-macadam works.

1 p.m.—Meet at the town hall, where members will be received by his Worship the Mayor, Alderman C. Mitchell, and Alderman Hardacre, chairman of the Highways and Waterworks Committee.

1.30 p.m.—Lunch.

2.30 p.m.—Wagonettes leave town hall for waterworks.

5.30 p.m.—Tea in the town hall, followed by—

6.30 p.m.—Meeting, when a paper, "Municipal Progress in Clitheroe," by Mr. A. R. Bleazard, borough surveyor, will be read.
Election of district officers.

Members are requested to fill in the usual form and return it to me not later than Wednesday, July 24th.

GEORGE HAYES, *Hon. District Secretary.*

147 Church-street,
Westhoughton, Lancs.

ROYAL SANITARY INSTITUTE.

ANNUAL CONGRESS AND EXHIBITION AT YORK.

The annual congress of the Royal Sanitary Institute, which is to take place this year at York, will open on July 29th. The proceedings will commence with a reception of the members and delegates in the Mansion House by the Lord Mayor, a public luncheon following, and in the evening the inaugural address to the congress will be delivered by the Archbishop of York.

On Tuesday, July 30th, a conference of municipal representatives and of engineers and surveyors will be held in the Exhibition Buildings, and on Friday, August 2nd, and the following day, the Engineering and Architecture Section will meet in the Museum. Mr. A. D. Greatorex, M.INST.C.E., borough engineer and surveyor of West Bromwich, will preside at the conference of engineers and surveyors, and the section devoted to engineering and architecture will have as its chairman Mr. J. Walker Smith, M.INST.C.E., chief engineering inspector to the Local Government Board for Scotland.

At the conference of engineers and surveyors discussions will take place on, among others, the subjects of Housing and Town Planning Progress, to be opened by Mr. H. Gilbert Whyatt, ASSOC.M.INST.C.E., borough engineer and surveyor, Grimsby, and Sewage Disposal in Rural Districts, to be opened by Mr. Ascough Rodwell, surveyor to the Skipton Rural District Council. The question of the modification of the Model Building By-laws from the rural point of view will be considered in the Engineering and Architecture Section.

The opening of the Health Exhibition arranged in connection with the congress has been fixed for Saturday, July 27th.

APPOINTMENTS VACANT.

Applications, with copies of recent testimonials, stating salary required, to be sent to Mr. W. Fiddian, Civil Engineer, Stourbridge, not later than Monday, the 29th instant.

NEATH RURAL DISTRICT COUNCIL.
RESOLVEN SEWERAGE WORKS.
APPOINTMENT OF CLERK OF THE WORKS.

The above Council require the services of a thoroughly competent Clerk of the Works to supervise the Construction of Sewerage and Sewage Disposal Works under the direction of the Engineer.

Salary £2 10s. per week, payable monthly, subject to one month's notice at any time on either side.

Every candidate must have had previous experience in the supervision of the Construction of similar works, and he will be required to check all levels and be competent to measure up and keep systematic account of the work done from day to day.

The works comprise the construction of detritus tanks, settling tanks, storm-water tanks, effluent tanks, bacteriological filter-beds, with automatic distributors, the laying of 12-in., 9-in. and 7-in. sewers, with the necessary manholes, flushing chambers, vent shafts, and other appurtenances.

Applications, stating age, with full details of previous experience and particulars of similar work the construction of which the applicant has supervised, accompanied by copies only of not more than three testimonials, are to be sent in to the undersigned on or before Monday, July 22nd, 1912, endorsed "Resolven Clerk of Works."

CUTHBERTSON & POWELL,
Clerks to the Council.

DARJEELING MUNICIPALITY, INDIA.
APPOINTMENT OF ASSISTANT ENGINEER.

The Commissioners of Darjeeling Municipality require the services of an Assistant Engineer.

Candidate must have some practical knowledge of sewage works, modern sanitary arrangements, waterworks, the construction and repairs of buildings and roads, and should be able to prepare estimates and reports.

The person appointed will be required to devote the whole of his time to these duties. He will be provided with free quarters and a pony, and will be allowed one Chuprassee.

The salary will commence at Rs.150/- or Rs.200/- monthly, according to qualification, and an increment of Rs.25/- a month will begin in each of the next two succeeding years.

Applications, which should be accompanied by copies of recent testimonials, will be received up to 31st August, 1912.

The Candidate selected will be required to pay his own passage money or train fare, but no security will be required.

Apply to Vice-Chairman

COUNTY BOROUGH OF GRIMSBY.
CEMETERY SUPERINTENDENT.

The Cemeteries Committee is prepared to consider applications for the position of Superintendent at the Cemetery on Scartho-road, at a commencing salary of £85 per annum, rising by £5 per annum to £100, with uniform, house, coal, &c., in addition.

Particulars of duties and form of application may be obtained from the undersigned on receipt of a stamped addressed foolscap envelope.

Applications, endorsed "Cemetery Superintendent," to be delivered not later than the first post on Tuesday, the 23rd instant.

H. GILBERT WHYATT, A.M.INST.C.E.,
Borough Engineer and Surveyor.

Municipal Buildings,
170 Victoria-street,
Grimsby.
July, 1913.

SEISDON RURAL DISTRICT.
KINVER SEWERAGE AND SEWAGE DISPOSAL WORKS.

The Seisdon Rural District Council require the services of a competent Clerk of Works to supervise the carrying out of the above Works under the general superintendence of the Engineer.

Salary £3 3s. per week.

Applications, in candidate's own handwriting, stating qualifications, and with copies of not more than three recent testimonials, to reach me on or before Friday, the 26th inst.

HERBERT TAYLOR,
Clerk to the Council.

Lichfield-street,
Wolverhampton.
July 16, 1912.

PONTYPRIDD URBAN DISTRICT COUNCIL.

APPOINTMENT OF FIRST ASSISTANT SURVEYOR.

The above Council invite applications for the appointment of First Assistant Surveyor.

Candidates must have a thorough practical and theoretical knowledge of the duties required, including Bridge Construction, Road Making, Private Street Works, Sewerage and Sanitary Engineering, Good Draughtsmanship and the general routine of a Municipal Engineer's Office.

Salary £100, increasing by annual increments of £5 to £140 per annum.

Forms of application may be had on application to the undersigned upon receipt of a stamped addressed envelope.

Applications, accompanied by copies of not more than three testimonials, must be received by the undersigned on or before Tuesday, July 30th, 1912 endorsed "Assistant Surveyor."

Canvassing, directly or indirectly, will disqualify.

J. COLENSO JONES
Clerk to the Council.

Municipal Buildings,
Pontypridd.
July 16, 1912.

PONTYPRIDD URBAN DISTRICT COUNCIL.

TRAMWAYS PERMANENT WAY.

APPOINTMENT OF FOREMAN.

The above Council require the services of a thoroughly experienced and practical man to supervise Repairs to the Tramway Track.

Applicants must have had experience in the construction and repair of Tramway Track for electric traction, including platelaying, paving in granite and wood blocks, bonding, jointing, &c.

Salary £130, rising by annual increments of £10 to £150 per annum.

Forms of application may be obtained from the undersigned on receipt of a stamped addressed envelope.

Applications, accompanied by copies of not more than three testimonials, must be received by the undersigned on or before Tuesday, July 30th, 1912, endorsed "Tramway Foreman."

Canvassing, directly or indirectly, will disqualify.

J. COLENSO JONES
Clerk to the Council.

Municipal Buildings,
Pontypridd.
July 16, 1912.

ALNWICK URBAN DISTRICT COUNCIL.

CLERK OF WORKS.

Applications are invited for the appointment of a Clerk of Works in connection with the augmentation of the Waterworks for the above district, at a salary of £3 3s. per week. The person appointed will be required to devote the whole of his time to the duties of the office and work under the instructions of the Council's Engineers, Messrs. Taylor, Wallin & Douglas, of Newcastle-on-Tyne.

It is necessary that applicants should have had considerable experience in levelling, setting out of works, and of ferro-concrete constructions.

Applications, in the candidate's own handwriting, stating age, qualifications, present and past experience, together with copies of not more than three recent testimonials, and endorsed "Clerk of Works," must be addressed and delivered to me at the Council Offices, on or before 25th July, 1912.

Probable duration of engagement six months. One month's notice on either side to terminate engagement.

Canvassing members of the Council or Engineers, either directly or indirectly, will be considered a disqualification.

JOHN BALMBRA,
Clerk to Urban District Council.

Council Offices,
Alnwick.
July 16, 1912.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. JULY 26, 1912. No. 1,071.

Minutes of Proceedings.

Bacteria.

The science of bacteriology is one which necessitates close and prolonged study on the part of those who desire to penetrate thoroughly into its mysteries and become acquainted with the denizens of that, in numbers, enormous world which is only made visible by the aid of the microscope. In spite of this we are not inclined to agree entirely with those speakers who, in the discussion upon Mr. William Ransom's paper at the annual meeting of the Institution of Municipal and County Engineers, declared that "the less they (engineers) knew of the intricacies of the question the better." Municipal engineers are, of course, mainly concerned with those micro-organisms which are connected with the supply of drinking water and the disposal of sewage and do not need to trouble with any others. In the management of works for the purification of water and sewage, municipal engineers gain their experience by practical observation of the many different processes in use, of the comparative results of these processes, and the varying conditions which occur from time to time at various stages in the processes, and if some knowledge of bacteriology does nothing more than increase their interest in the works under their control it is well worth acquiring, and no apologies are needed for bringing forward for consideration at their annual meeting such an excellent paper as that read by Mr. Ransom. The discussion itself, in the present case, indicates the value of introducing such a subject, as it was of an eminently practical character. We do not for a moment suggest that engineers should omit to call in bacteriologists to assist them in solving the many difficult problems which confront them from time to time, but we believe that those who have some knowledge of the subject will be more likely to recognise its importance and the necessity of employing a fully qualified bacteriologist than those who know nothing at all about it, and, for that very reason, are incapable of appreciating the part which bacteria play in the success or failure of the works in their charge.

The paper itself needs no comment beyond a word of praise for its straightforward, simple style. We cannot, however, refrain from criticising the opinion expressed by Mr. E. Willis that they "should not try to sterilise milk and other forms of food, as by so doing they *only eliminated pathogenic organisms*, which were largely eliminated from the human system by the phagocytes, and so long as they could strengthen the latter they would keep their bodies healthy." The italics are our own, and we would ask what other purpose is sterilisation supposed to serve beyond the destruction of pathogenic organisms? How would Mr. Willis "strengthen the phagocytes" of the large number of children who now benefit by the use of pasteurised milk; or those of the inhabitants of towns like Lincoln and a number of other places, particularly in America, on those occasions when the water supply was suddenly found to be infected with typhoid or other disease germs; or those of all the vast numbers of poorer people who, unfortunately, are compelled to live under such devitalising and weakening conditions as those which exist in our slum areas? We are fully aware of the fact that sterilisation, on a practical scale, is not perfect, in that it does not affect the spores of spore-forming bacteria, but fortunately most disease germs are, we believe, not of the spore-forming species, and are thus unable to escape destruction by methods of sterilisation properly carried out. We have personal experience of the difficulty of impressing people with the importance of "strengthening their phagocytes," or even of getting them to accept the statement that they possess such valuable defenders against disease germs in their bodies, especially those people who are naturally inclined to drink or eat more than is good for them. It seems to us that it is much more feasible for local authorities to do their best by sterilisation and other means to prevent pathogenic germs from gaining access to the bodies of the ratepayers than to attempt to make them "strengthen their phagocytes," except, of course, by improving in a general way the conditions under which the people live, and thus raising the standard of public health.

The space at our disposal is limited, but we cannot refrain from observing that at least one of those municipal engineers who took part in this discussion has evidently acquired some considerable knowledge of bacteriology and has made good use of it. Mr. E. G. Mawbey made some pertinent remarks with reference to the necessity for frequent collection of house-refuse, and drew attention to the effect of dirty and dusty roads and streets upon health. Accumulations of refuse breed flies and we believe that these

insects disseminate disease to a much greater extent than is generally understood. Again, experiments made to ascertain the number of bacteria in sewer air showed that there were an enormously greater number in the air which came down a side entrance to a manhole from the street than in the air of the sewer itself. It is practically certain that in reducing the dust nuisance, as so many have done very successfully by modern methods of treating the road surface, municipal engineers have indirectly done much to improve the general conditions of public health, and if Mr. Ransom by his paper, and in particular Mr. Mawbey by his contribution to the discussion, should have caused some of those who were present to devote a little attention to the bacteria in road dust and refuse heaps, they will have rendered a valuable service to their profession.

* * *

The Road Crust as an Arch.

While the arched form which is usually given to a road crust assists in the maintenance of the material by favouring a tendency towards compression rather than a separating effect, it is not often that such a crust is regarded as actually playing the part of an arch capable, as an arch, of supporting the loads which come upon it. Some extracts which appear in another part of the present issue, however, relating to concrete road-crusts, show that the small amount of strength or efficiency which a road crust displays, when regarded as an arch, is sometimes greatly exaggerated; so that one does from time to time, as in the present case, come across the statement that the strength of a road crust regarded as an arch is really an important matter on ordinary roads. The statement which Mr. Logan Waller Page has, as we think by inadvertence, recently made applies to roads the surfaces of which would have a camber of only $\frac{1}{4}$ in. per foot, and on this basis we have made some calculations which show what the stresses would really be in the case of such a road provided with the concrete crust.

First, taking the case of a road 20 ft. wide, with a 6-in. concrete crust, having a rise of $2\frac{1}{2}$ in. at the middle, which is that given by a slope of $\frac{1}{4}$ in. per foot, we find that, taking only the dead weight of the road crust itself, we should get a pressure of about 200 lb. per square inch, while with a moderate crowd load of 60 lb. per square inch, the pressure on the concrete at the crown would be 400 lb. per square inch, and the thrust per foot run on the margin would be nearly 13 tons. A road margin designed to take a thrust of 13 tons per foot run is a fairly solid abutment; but if we are to regard the road crust as an arch, it follows, of course, that we shall have to regard the margins of the roads as abutments. The arch having, however, a very small rise, the horizontal components of the thrusts are enormously greater than they would be in the case of a bridge, the rise of which is calculated partly with a view to keeping down the thrusts upon the abutments below some reasonable figure. If we suppose now that a traction engine with an axle weight of 10 tons proceeds along the 20-ft. road just within one half of it, we find that this imposes upon the concrete a stress of over 3,000 lb. per square inch; and this is on the assumption that the load is carried by a strip 3ft. wide. Since we might have another vehicle behind or in front, we cannot regard the thrust upon the road margins as distributed over more than 10 ft. lengthwise, giving 30·4 tons per foot run, the thrust at the crown being 304 tons. If we add together the thrusts upon the margin due to dead load and live load we get very nearly 37 tons per foot run.

Taking next a 30-ft. road with 8 in. of concrete, the rise of $\frac{1}{4}$ in. per foot gives $3\frac{3}{4}$ in. at the crown, which for convenience we may call 4 in. Taking the dead load, we get a thrust of nearly 12 tons and a pressure at the crown of 280 lb. per square inch. A moderate crowd load would give, in addition, a pressure of 211 lb. per square inch, or a thrust per foot run of about 9 tons. Thus we have for dead weight and crowd load taken together a pressure at the crown of over 490 lb. per square inch, and at the margins over 20 tons per foot run. Suppose now that a traction engine is proceeding along one side of the road 7 ft. from the centre, and is passed by a motor lorry, one wheel of which comes a foot past the centre on the same side as the traction engine, we get for this loading a thrust of 408 tons. If we assume that this is distributed over 4 ft. lengthwise—a liberal allowance—the pressure is more than a ton per square inch, or about 2,380 lb. per square inch. The thrust per foot run at the margins, even if we assume it to be distributed over a length of 20 ft., amounts to nearly 20 tons. Taking the dead load and the live load together we get a pressure at the crown of nearly 2,660 lb. per square inch, and a thrust at the margins of over 32 tons per foot run. In actual practice small local depressions would enormously increase the pressures as calculated above, even if abutments capable of taking the thrusts were really built, while the thrusts taken here as distributed over a 3 ft. or 4 ft. width would, owing to local cracks, be often concentrated on areas of a half or a quarter the size. Generally, what usually makes the arch idea so impossible of realisation is the fact that there is hardly ever an abutment capable of taking the thrusts except when the road is in a cutting in solid rock. The arch *form* for a foundation is suitable in many cases, as already noted, but when it is desired to develop the strength of a crust as an arch in rock cutting, the rise given to the foundation course should be much greater than any which can be given to the surface. One course or the other must then be thicker towards the haunches, the essential condition being that if the sub-crust is to develop strength as an arch without excessive pressures, its under surface must have a sufficient rise.

The Alkaline Waters of the London Basin.

The review on Dr. Thresh's paper dealing with this subject, which appears in our present issue, discusses the matters brought forward from the point of view of those engineers whom Dr. Thresh condemns in his paper. It is certainly remarkable that Dr. Thresh, posing as one "not competent to compare the mineralogical constituents of granite with those of the Thanet sands," and inviting the advice of the geologist, should nevertheless unhesitatingly condemn the practice of geologists and engineers in general who "persist" in sinking wells into the chalk instead of stopping short at the Thanet sands. Dr. Thresh is beyond doubt a great chemist and medical officer; he is also a great authority upon matters of water supply, and his opinion on all matters pertaining to its quality will always carry the greatest weight. It is as strange, however, for him to condemn the practice of engineers who have made well-sinking their life work, as it would be for the engineers to give a medical opinion. While the profession of the doctor, of the lawyer, or of the chemist is in each case sacred, so that no layman can give an opinion without at once rendering himself ridiculous, every one is an engineer, and the chemist in particular, together with the medical officer, will frequently be found giving an opinion in the most confident voice on purely engineering matters, often to the inconvenience of the engineer. It is very easy for the ordinary layman to bring forward plausible and specious arguments difficult to disprove which are nevertheless in absolute disagreement with practical experience. Sewage disposal engineers are frequently hampered by such comments and advice, which, when given by men of high scientific standing, naturally carry great weight, however erroneous they may be.

It is surprising that a man of Dr. Thresh's great

experience should tell us in so many words that our chalk wells ought to have stopped short in the running sands of the Thanet beds—sands which are notorious for choking bore tubes and for being peculiarly difficult to work in. Dr. Thresh advises this apparently solely because the water in the sand is soft. On the other hand, as was recently demonstrated by Dr. Houston, there is no evidence to show that hard water is less beneficial to health than is soft water. Then there is the question of the rate of supply. The water may exist in the Thanet beds, but obviously it cannot flow out of a close, retentive stratum at the same rate as it will flow from chalk fissures. What engineer dealing with chalk wells has not known the supply at the first level close under the Thanet sands to fail, and where it has been found that by descending to a deeper level in the chalk, or by driving a heading well below the Thanet sands, an ample supply has been obtained? Would it have been practicable in such a case to have drawn the supply entirely from the Thanet sands? Yet Dr. Thresh tells us that "chalk absorbs rather than yields water" in these very places. It cannot be doubted that Dr. Thresh's remarks will in some degree cause temporary annoyance to those engineers who "persist" in sinking wells into the chalk, but it is hardly likely to cause them to change their methods.

* * *

Institution of Municipal and County Engineers: The District Committees.

The establishment of the District Committees is undoubtedly one of the most important features of the new constitution of the Institution of Municipal and County Engineers, and it was a happy idea on the part of Mr. A. H. Campbell, M.INST.C.E., the city engineer of Edinburgh, to submit at the recent annual meeting a paper which was pregnant with suggestion as to the modes in which these committees may promote progress. If the District Committees are adequately to fulfil their real function and to become centres of influence, they will have to operate on lines of considerably greater originality and freedom than the strict letter of the articles and by-laws under which they are constituted suggests. To use the very apt phrase of Mr. Campbell, the printed constitution is but the skeleton of the body, but the dry bones to the living reality. This reality must consist of the putting on of flesh, and the stirring to the depths of that as yet untouched body of opinion and of skill that still holds aloof, and that must be brought into a living unity with the institution. The main suggestions contained in Mr. Campbell's paper may be summed up in the three ideas of decentralisation, local self-government, and co-ordination. In regard to decentralisation, the proposal is that the districts as at present constituted should further subdivide themselves into county units in order that frequency of meeting and community of interest may lead to a more vigorous local organisation and a realisation that the institution has something to offer to every member. Further, the District Committees should not become stereotyped, but each should be allowed the fullest latitude in organising its affairs in accordance with the requirements of the localities concerned—that is to say, the principle of local self-government should be fully conceded. But if this freedom of development is not to result in a dissipation of energy or in disintegration, it must be dominated by an organisation by which the local county subdivisions shall be fully linked up through the district committees with the central council. These are the suggestions, and in the main we agree with them. The future successful working of the institution is a matter of such importance, however, that we shall be pleased to hear from any of our readers who may have suggestions to offer. Two minor points were raised in Mr. Campbell's paper—*viz.*, the possibility of effecting a considerable saving in the printing and postage bill, and the desirability of the venue of the council meetings being altered from time to time. Both these matters are worthy of consideration by the council.

* *

Public Health Congresses.

With the exception of the institutions which are specially constituted for municipal engineers, there is probably no professional society which is more appreciated by them than the Royal Sanitary Institute, the annual congress of which will take place next week at York. The members and delegates will be received by the Lord Mayor, and the fact that the inaugural address will be delivered by the Archbishop of York is an acknowledgment of the public character of the good work which the institute is doing. In connection with the congress there is to be a conference of engineers and surveyors, the subjects for discussion comprising housing and town planning progress, and sewage disposal in rural districts; while the question of the modification of the Model Building By-laws from the rural point of view will be considered in the Engineering and Architecture Section. It will thus be seen that many of the subjects which come within the purview of the congress are of peculiar interest to municipal engineers, many of whom will doubtless desire to be present. The Health Exhibition which has been arranged in connection with the congress will be opened to-morrow (Saturday).

The inaugural meeting of the congress of the Royal Institute of Public Health in Berlin took place yesterday, and the proceedings, which extend over three days, will be conducted in five sections. Many of the subjects for discussion are principally of medical interest, but the section devoted to Municipal Engineering, Architecture, and Town Planning, presided over by Mr. P. C. Cowan, D.SC., M.INST.C.E., the chief engineer to the Irish Local Government Board, will be of special interest to our readers. We have already announced the titles and authors of the papers to be read in this section, the chief topics being connected with water supply, sewage disposal, town planning, and reinforced concrete practice in architecture and engineering. Special papers dealing with the various public health services of Berlin will be read by delegates appointed by that city to attend the congress.

The Tiverton Road Surveyor's "Reprimand."

Jedburgh justice of the original and time-honoured type was deplorable in so far that it was irretrievable, but in these days when it is sometimes applied to civil as apart from capital cases there is at least the satisfaction of knowing that the verdict may be happily recalled and the damage thus in part repaired. Some such thought as this arises in considering the case of Mr. A. J. Mildon, highway surveyor to the Tiverton Rural District Council, who was recently reprimanded by resolution on the alleged ground that he had broken a contract with a road contractor without consulting the council. In approved Jedburgh formula the council, after condemning the road surveyor, appear to have referred the matter to the General Purposes Committee for inquiry, with the result that at the recent meeting of the council it was moved by the Rev. J. Fowler that the motion reprimanding Mr. Mildon be rescinded on the ground that the committee considered that the road surveyor had cleared himself. This was eventually agreed to after a discussion in which it was stated that the surveyor had always been allowed a great deal of latitude in the management of the roads, and "they had not much to complain of." The correction by the council of their harsh judgment is, of course, very welcome, but in future it will be advisable if they pursue the approved method of justice by arranging for the trial to precede, not to succeed, the sentence.

The Alkaline Waters of the London Basin.

REVIEW OF DR. THRESH'S PAPER BY A WATERWORKS ENGINEER.

In a paper read before the Essex Field Club Dr. Thresh recently discussed the character of waters derived from the chalk and Thanet sand in various parts of Essex. Various analyses were quoted and certain experiments were described from which conclusions of a very interesting nature are drawn. The conclusions are to the effect that the Thanet sand lying beneath the London clay possesses the power of softening hard water by substituting soda, and possibly potassium salts, for those of calcium and magnesium. In fact, Dr. Thresh appears to find in the Thanet sands a natural zeolite which can be revivified by treatment with brine. The constituent possessing this property does not appear to be removed by treatment with dilute acid, but it can be removed by treatment with strong hydrochloric acid. The property of softening water belongs both to the clayey and to the sandy matters. The softening effect is increased greatly by treating the sand with brine. Further it appears that within certain limits a sand which has ceased to soften a water of a certain degree of hardness will exert a softening effect upon a water of a greater hardness, and will exert a hardening effect upon a water of a softer character. Dr. Thresh has also obtained similar results when using granite dust in place of the Thanet sand.

It appears that Dr. Thresh's knowledge of the existence of zeolites caused him to make his experiments with the Thanet sand, for he says that, following twenty years of research work as to the sources of sodium salts present in the Essex water: "Last year, when referring to Bischof's 'Chemical and Physical Geology,' I came across a passage stating that a calcareous water passing through certain silicates of alumina containing potash and soda became softened, and directly afterwards I heard of a German process of softening water by filtration through an artificial zeolite, and the revivifying of the zeolite by treating it with brine." This apparently led to the experiments with powdered soda glass, powdered granite, and finally with Thanet sand. Dr. Thresh later directs attention to the fact that granite and Thanet sands have properties in common which are probably due to a common constituent. He points out that a sample of felspar has given disappointing results, and tells us that experiments have been commenced with mica. It is curious to read this statement in the light of the well-known fact that the lime zeolite known as harmatome or phillipsite, contains silica, alumina, lime and water, and has therefore a considerable resemblance to felspar, but certainly is not felspar. Geikie defines zeolites as "a characteristic family of minerals which have resulted from the alteration, and particularly from the hydration, of other minerals, especially felspars." Why, then, does Dr. Thresh look for a zeolite in felspar or mica?

Again, the action of brine on natural zeolites is no new discovery. As long ago as 1850 the fact was established that zeolites placed in contact with salt solutions would be affected, even as Dr. Thresh surmised that the zeolite in the Thanet sand would be affected before he treated it with brine. However, Dr. Thresh has set before us certain definite facts ascertained by experiment which prove that the Thanet sands exert a softening action on water.

WATER IN THE CHALK.

Analyses of waters tend to show varying characters of waters derived from the chalk and Thanet sands in Essex. For these differences Dr. Thresh offers the following explanation: "So long as water in the chalk contains carbonic acid it continues to dissolve the chalk and open out the fissures. When all the acid has been used up in dissolving the calcium carbonate it no longer possesses the power of opening out fissures, and as the chalk becomes more compressed by the superincumbent mass of sand and clay it becomes so dense as to be almost impervious. Beyond this point, therefore, the water cannot travel in the chalk, and it comes up through the fissured chalk into the sands above, and then becomes exposed to their softening action."

Dr. Thresh's contention that water entering the Thanet sands from the chalk becomes softened is proved by his experiments, but the inference that water rises in the Thanet sands because it has no carbonic acid with which to open out fissures at lower levels is surely open to criticism. The fissures are not produced by the carbonic acid originally. If the chalk is impervious, this is due to the fact that it has no fissures, and consequently water could not get into it, and the fact that it does or does not contain carbonic acid can have very little bearing upon the case. It is very well known by geologists that water is generally found in greatest quantities within the first 50 ft. or 100 ft. below the level of the valleys in a chalk district, and again in the beds immediately incumbent on the chalk marl, and that the intermediate portions are constantly found without any important quantity of free water. Dr. Thresh writes as if it were wrong to attempt to obtain water except from the upper layers of the chalk, and preferably from the Thanet sand. He apparently overlooks the facts that the beds at a much deeper level—*viz.*, those immediately incumbent upon the chalk marl—are also good sources of supply. There is a well at Saffron Walden, for instance, which passes through 1,000 ft. of chalk, while in a well at Diss water was obtained after the whole of the chalk had been traversed. In the face of the abundant evidence of wells sunk through the London clay into the chalk yielding good supplies, it is surprising to find that, in Dr. Thresh's opinion, "experience . . . proves that the chalk absorbs rather than yields water in those areas where it is covered with a large thickness of London clay." By "large thickness" one imagines that Dr. Thresh has in mind the thickness of the clay in South Essex, and wells such as those of the Herts and Essex Waterworks Company at Harlow, which derive their supply from the chalk and produce a hard water, as do a large number of other chalk wells which might be quoted.

ENGINEERS' MISTAKES.

Dr. Thresh observes that: "Engineers persist in continuing the borings made in Central Essex into the chalk, but there is no evidence of more water being obtained than would have been the case had the boring ended in the sands, whereas there is evidence that some of the sand water is lost. Thus at Writtle a certain amount of water was obtained from the Thanet sands, and when the boring pierced the chalk most of the water disappeared, and the chalk had to be plugged to restore the supply. At Tollesbury, where a deep bore has just been made, the water level fell some 15 ft. when the chalk was pierced, a sure indication of a loss of water. Experience elsewhere, which I am not at liberty to mention specially, proves that the chalk absorbs rather than yields water in those areas where it is covered with a large thickness of London clay. In any case, the waters have a common origin, and if the chlorides are derived from the sea they should be accompanied by bromides, and the amount should be approximately the same in proportion to the chlorides as in sea water. In sea water, as before stated, I find that there is one part of bromine to from 274 to 378 parts of chlorine, and that in the alkaline waters the proportions vary, there being for one part of bromine from 225 to 442 parts of chlorine. Considering the difficulty of making anything like an accurate estimation of the bromine, these figures are sufficiently close to indicate some relationship. The difficulty of making an exact determination led me to abandon temporarily further determinations until I had worked out a process which could be relied upon. This has proved far more difficult than I had anticipated, and I am not yet so certain of my results as to feel justified in giving others. I suspect that in sea water there are other compounds of bromine besides bromides, and that there are traces of iodides and iodates or both. This, however, is a chemical question upon which I shall have something to say elsewhere.

HOW TO OBTAIN SOFT WATER.

"Possibly it may be asked whether the softening effect of the Thanet sands is sufficient to account for the removal of nearly all the calcium and magnesium salts from the large volume of water taken from the sands. I think there can be no doubt about the answer. Taking Essex alone, the area under which Thanet sands exist must be about 666,000 acres, and assuming the average thickness to be 12 ft. (a very low estimate), and that each cubic yard contains

28 gallons of water, the water held in the whole of the sand will be about 360,000,000,000 gallons. But my experiments indicate that each cubic yard would completely soften 10 cub. yds. of a chalk water 30 deg. of hardness. The amount of water the Thanet sands are capable of softening on this basis is therefore 21,600,000,000,000 gallons.

"Essex (Administrative County) has a population of over 1,000,000, and if liberally supplied with water it would use 30,000,000 gallons per day, or 10,950,000,000 gallons per year. The amount of Thanet sand under the county would completely soften the whole supply on the above basis for 2,000 years, and partially soften for a much longer period."

IMPOSSIBILITY OF DR. THRESH'S PROPOSAL.

Those engineers whose experience extends to the sinking of wells through the water-bearing Thanet sands may well wonder whether Dr. Thresh's advice is meant to be taken seriously. They will probably retain a lively memory of any attempt to sink a brick shaft, or to drive a heading in this formation if they have ever attempted to do so. The water-bearing Thanet sand is frequently, if not generally, running sand. It chokes bore tubes and renders any ordinary water-gathering device impracticable. Further, the water which it contains is apt to be highly charged with iron. The best method of sinking a well into the upper chalk through this very difficult stratum is to use cylinders, and to continue them into the hard chalk. It is true that where such a well has been made one frequently finds that the water in the autumn, when the chalk-water level is lowest, will run in from the upper stratum of sand. Hence it sometimes follows that the same well will yield a comparatively soft and irony water in the autumn or early winter, and a very hard water in February, and later after the hard water in the chalk has had time to rise. Whether the water coming from the Thanet beds came originally from the chalk, and was held up in the more retentive material after the chalk-water level had fallen is open to question in some cases, but when the sands are covered with a large area of London clay this appears to be the only reasonable explanation.

Dr. Thresh's paper contains excellent material for discussion, but it appears that his future work should include a further study of the nature of zeolites, and that he should explain more fully the means whereby those engineers who "persist in continuing the borings made in Central Essex into the chalk" may obtain some of the 360,000,000,000 gallons of water held ready and softened in the Thanet sand.

Summer School of Town Planning.—The Marquis of Crewe, who is president of the Summer School of Town Planning which is to be held at Hampstead Garden Suburb, is announced to give the inaugural address in the Institute Hall on Saturday, August 3rd. The summer school, as already reported in these columns, is being held under the auspices of the London University Extension Board, and covers a fortnight—from August 3rd to the 17th. The lectures and demonstrations are intended to be of special value to municipal engineers, architects and surveyors, but most of the lectures will be of interest to others who are concerned with town planning from the more general aspect of civic and economic progress. Thus officials of municipal and district councils will find in the syllabus, in addition to courses on the engineering and surveying problems involved in town planning, a series of lectures on the legal aspect of the subject by Mr. E. R. Abbott, clerk to the Ruislip-Northwood Council, who has just successfully piloted the first town planning scheme from a local authority to be accepted by the Local Government Board. Prof. Adshead, who occupies the first chair of town planning established in an English University, will give a series of lectures on "Town Planning in Foreign Countries and Past Times." Mr. Raymond Unwin, F.R.I.B.A., who is responsible for the planning of the Hampstead Garden Suburb, will lecture and demonstrate on "Town Planning in Practice." Among other special lecturers are Mr. Henry Vivian, J.P., who will speak on the financial aspects of the subject, and Mrs. S. A. Barnett, to whose genius and energy, as founder and honorary manager, the initiation and success of the Hampstead Garden Suburb are largely due. Applications to attend the course, or single lectures or excursions, should be addressed to the Hon. Secretary, Summer School of Town Planning, Hampstead Garden Suburb, N.W.

CORRESPONDENCE.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesy."
— GEO. HERBERT, *"The Temple."*

HINCKLEY WATERWORKS.

To the Editor of THE SURVEYOR.

SIR,—In connection with my paper on the Hinckley waterworks, which was read at the annual summer meeting of the Institution of Water Engineers at Cheltenham,* several speakers, in the discussion of the paper which followed, were desirous of knowing the cost of the brick service reservoir so as to be able to compare it with the cost of the reinforced concrete reservoir mentioned in Mr. Percy Griffith's paper on the Skegness waterworks.

One or two speakers were of opinion that the cost of the Hinckley brick reservoir was fairly high. I am now taking this opportunity of comparing these two reservoirs as regards cost, size and capacity, as I stated I would do, and I have therefore tabulated the following particulars:—

—	Hinckley brick reservoir.	Skegness reinforced concrete reservoir.
Dimensions ...	100' 6" × 78' 9" × 12' deep of water	100' × 70' × 10' deep of water
Capacity ...	500,000 galls.	400,000 galls.
Cost	£3,0 0	£2,3 9

From the above figures it will be noticed that the costs of the two reservoirs compare very fairly and equally, considering that the capacity of the Hinckley reservoir is one quarter in excess of the Skegness reservoir, and that the cost of the former is about one quarter in excess of the latter.—Yours, &c.,

E. H. CRUMP.

Council Offices,
Hinckley.
July 20, 1912.

Derwent Waterworks.—The Derwent Valley Waterworks will be officially opened on Thursday, September 5th, by Sir Edward Fraser, the chairman of the Water Board.

Electric Traction in Scotland.—A report, recently published, shows that in Scotland horse tramways have now almost disappeared, and that electric propulsion is practically universal.

Troon and Prestwick Water Supply. — The Loch Bradan waterworks, which have been constructed for the supply of water to Troon, Prestwick, and the county special district, were formally opened last week by the Duke of Portland, K.G. Mr. John Eaglesham, Ayr, was the engineer, and the work was carried out under the personal supervision of his assistant, Mr. J. D. Riddell, while the contractors were: Constructing dam and laying first section of conduit, Messrs. Neil MacLeod & Sons, Edinburgh; providing and laying cast-iron piping of second, third, and fourth section, Messrs. D. Y. Stewart & Co., Limited, Glasgow; concrete tubes for conduit, Mr. John Ellis & Sons, Limited, Leicester; valves and fittings, Messrs. Glenfield & Kennedy, Kilmarnock. The cost of the undertaking amounted to upwards of £90,000, including Parliamentary expenses and land claims.

London Water Supply: Proposed New Reservoirs.—At the next meeting of the Metropolitan Water Board sanction will be sought to the expenditure of £1,650,200 on the immediate construction of reservoirs. This is part of the scheme for the future supply of water to London, power for which was given by Parliament under the Act of 1911. It is proposed that reservoirs 6 and 7 at Littleton, together with appurtenant conduits, diversion of the river Ash, and construction of intake works at Laleham, shall be undertaken and let in one tender. A Bill is to be promoted to provide for the construction of a steel conduit from reservoirs 6 and 7 to Kempton, filter-beds at Kempton, an aqueduct from Greenford to the new service reservoir, and the revival of the powers for duplicating the New River Company's aqueduct between Kempton and Fortis Green.

* See THE SURVEYOR, June 21st.—Ed.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

Following the discussion reported in last week's issue, the subjoined contribution was submitted for consideration at the recent annual meeting of the Institution of Municipal and County Engineers.

BACTERIA.

By WILLIAM RANSOM, ASSOC.M.INST.C.E.,
Assistant City Surveyor, Worcester.

From Photo by A. J. Nash, Worcester.

Mr W. Ransom is a Sussex man, and, after serving his articles, accepted the post of assistant engineer to the Worcester gasworks, where he gained considerable experience in superintending the extensions to the gasworks. He was then appointed assistant surveyor to the corporation of Worcester, and, under Mr. T. Cook, acquired experience in water and sewerage engineering. He is an associate member of the Institution of Civil Engineers, and a professional associate of the Surveyors' Institution. He has read papers before the Royal Sanitary Institute upon the disconnecting trap and building by-law reform. He was awarded a premium this year for his paper upon "The Purification of Public Water Supply," read before the Institution of Municipal and County Engineers. He is a frequent contributor to the technical papers.

The popular conception of the subject of bacteria is not very inspiring, for it is usually sufficient to mention the word microbe, germ, or micro-organism to bring to imagination or mind of most people hideous and awful creatures with creepy, slimy legs, and repulsive and ferocious features lying in wait to injure poor humanity in his food, drink, and air. Water and sewage engineers, however, know how much they owe to the bacterial work, and that bacteria play a very important part in the dispensation of Nature, and are as much the allies as the enemies of mankind.

If we take a microscopic tour as we shall find that the Lilliputian and whilst revealed to us are full of romance and excitement, and that its myriads of inhabitants are gifted with powerful means for good or evil, as great or greater than any other agency in the universe. We must first clearly understand that our travels will be undertaken, not in the animal world, but in the plant world. The organisms called bacteria comprise a class of low plants, and for a long time the importance of their place in Nature was not recognised. They were simply a sub-division of one of the lowest forms of life, but as the study of their life history became specialised, and bacteriology became a science, it was soon evident that this sub-division of the plant world was of greater importance than the rest of the division. The word "schizomycetes" has been adopted to classify all microscopic plants commonly included under the term bacteria and yeasts. The latter, however, have a higher class of which fungi specimens are known by the name of bacterium.

The study of bacteria commenced with the invention of the microscope, and as that instrument improved, so our knowledge of the bacteria world developed into an exact science.

It was a Dutchman named Leeuwenhoek, born in 1632, who first brought to the notice of man the existence of these creatures. He discovered living organisms in water which he called animalcules. The next man to advance the subject was Plenciz of Vienna, who about 1750 first conceived the idea that decomposition was due to the above animalcules. Scientists were gradually coming to this opinion when Liebeg checked advancement by advocating that decomposition and putrefaction were simply chemical actions. For a considerable period the theory of spontaneous generation was held, except by here and there some scientific worker investigating upon the right lines and yet unable to bring his facts in a sufficiently convincing form before the world. It was Pasteur who really rescued bacteria from obscurity and gave them their right place in the scientific world. The story of his experiments and researches is a romance, and gradually he accumulated such an overwhelming array of evidence that he was able to give the deathblow to the theory of spontaneous generation. His experiments demonstrated beyond doubt that fermentation, putrefaction, and infectious diseases were all due to micro-organism. Koch and others followed up the investigations, and a new science was opened to the world, with results as far reaching as any other branch of knowledge.

The microscopic world is densely populated, for upon one square inch it would be possible to find a population 100 times as dense as that of London. There are all sorts and conditions of bacteria, but they can be described as minute specks or cells of protoplasm which usually take one of the following shapes:—

(1) Round cell form, or the coccus.
(2) Rod cell form, or the bacillus.
(3) Thread cell form, or the spirillum.

The cocci consist of groups of round cells less than 1-25000 in. in diameter, and appear in different forms, either in single bodies or in groups of one, two, three, four, and often having the appearance of a string of beads.

The bacilli consist of cells longer than they are broad. Many of these varieties are gifted with powers of motion.

The spirilla consist of wavy threads attached to a round or rod-like cell.

These varieties of microbes are the simplest forms of life that are known to science, and are to be distinguished from the yeasts and moulds, which have a more complex life history.

The bacteria have a short but active existence, but they reproduce themselves in great numbers by budding, division and spore formation. The latter method of reproduction is one adopted to ensure the preservation of species, in case the other methods should fail. The spores, or seeds, are formed inside the rods or spiral forms, consisting of a tiny bit of protoplasm. The bacterium producing the spore usually dies, but it leaves behind the hardiest form of living matter known to science. Spores can survive hunger and thirst, the perils of an Arctic winter, and some even the dangers of boiling water. These spores naturally increase the difficulty of disinfection, for means which would speedily kill off all bacteria may be unable to touch the sport, which, Phœnix-like, springs into life from the ashes of ordinary methods of disinfection.

POWER OF MULTIPLICATION.

Bacteria have a wonderful power of multiplication. If favourable conditions could arise one bacterium would produce in one day over 16,000,000 descendants, and in two days over 281,500,000,000, which it has been calculated would form about one pint, and weigh about 1 lb. Fortunately for this densely populated world favourable conditions for such a growth do not occur for an extended period, for reproduction is speedily checked by want of food, and also by the fact that bacteria are quickly killed off by the products generated by their own existence. The wonderful power of growth in bacteria is due to the food which they can assimilate, for they can feed on a complex diet and take up organic substances all ready for absorption. Most plants have to obtain their food from simple substances such as CO_2 and H_2O. As bacteria can live on the food which they find ready manufactured for use, their growth and multiplication is simply limited by their power of absorption, until the chemical changes produced in the food itself by the life of

the bacteria checks the growth and affects the food substances.

One of the nearest bacterial relatives in the plant world is the green plant called oscillaria. The green colouring matter called chlorophyll is, of course, absent in the bacteria, and it has been surmised that it is the absence of this matter which forces the bacteria to find new and unorthodox methods of food supply.

IDENTIFICATION PROCESS.

The means taken for the examination and identification of bacteria are complex. The broad principle consists of sterilisation and cultivation. Supposing, for instance, a liquid has to be bacterially examined, the first thing to be done is to sterilise all instruments and appliances which will be used during the examination. This is done by various means, such as heat, filtration, &c., so as to kill off all bacterial life to enable the examination to be made without fear of any outside bacteria being introduced into the sample. Every care has to be taken to prevent air obtaining access to the sample, which might thus be contaminated with foreign bacteria. When sterilisation is complete a few drops of the sample liquid are applied to a culture medium in sterilised surroundings. The medium consists of some suitable food material, such as gelatine, upon which the bacteria present in the sample may thrive and develop. After a little time the naked eye will reveal on the gelatine plate little specks, "each centre being in reality a colony or pure cultivation of one particular organism." Each little speck can be transferred to a separate culture medium so that a pure cultivation can be developed and undergo a thorough investigation. The method adopted for counting the number of specimens in any known quantity is comparatively simple. A small measured portion of the liquid is applied to the culture gelatine, and the bacteria allowed to develop. After a certain time the specks or colonies are counted, and as each speck or colony has come from one germ or spore the number of bacteria in the quantity under examination is thus ascertained. The real difficulty is, of course, in discriminating the individual germ from a group of bacteria. One of the many methods adopted for the identification of bacteria is that of staining the microbes under examination. Some are particularly partial to special dyes, while some spores will not be stained by a weak solution. A liquid under examination would be divided into several portions, and dyes of varying strengths and colour applied, and as a result different kinds of bacteria would be stained to various colours. Results, however, are very difficult to standardise, for bacteria are so easily influenced by the food they live upon, and in the same family it is most difficult to establish the relationships between the rich and the poor, the fat and the lean! Bacteria very quickly deteriorate under some circumstances, and weakened specimens appear to possess characteristics altogether different from their more robust brethren. The difficulties of identification are therefore very many, and we have often to be content with judging our secret friends and foes by their actions rather than by their names. Dr. Houston has told us how the typhoid bacilli quickly deteriorated in raw Thames water, and that he had drunk 218,000,000 attenuated typhoid germs without any ill effect.

The purification of river water for public purposes chiefly consists in the removal of the majority of the bacteria. The work done by sand filtration is estimated by the percentage of bacteria removed, so that the bacterial examination of water is of great importance to the water engineer. The gelatinous micro-organic tissue which gradually forms on the top of the sand filters acts as a bacterial screen, or as a sort of cultivation medium which retains the majority of bacteria from passing through the filter. The perpetual flow of the water must carry away with it those products of bacterial life which would otherwise automatically prevent the growth of the gelatinous scum. Whatever these products may be, they do not have a deleterious effect upon the water. Filters occasionally get out of working order, and perhaps it may be due to a partial period of suspended bacterial action, because the products of bacterial life are not being carried away sufficiently fast.

In recent months a great deal of discussion has arisen as to the significance of bacillus coli in drinking water. Mr. J. R. Johnstone, in the publication of the United States of America Department of Agriculture, has been recording some remarkable experiments and investigations. He has experimented with bacillus coli, and has found that healthy cocoanut trees when inoculated with it are attacked with the bud rot disease, while organisms cultivated from diseased trees behave exactly as the bacillus coli. This opens up a large question to water engineers, as the bacillus coli has been looked upon rather as a danger-signal than as an active source of disease.

Bacteria are to be found almost everywhere. They are present in the soil to a depth of 3 ft. to 4 ft., in water, and in the air. They are most plentiful wherever decay is going on, because of the abundance of food supply thereby provided. While bacteria do not occur in the tissues of the living healthy body, they attach themselves very readily to the surface of the body.

EFFECT OF SUNLIGHT.

The effect of sunlight upon bacteria is very marked. A striking but simple experiment consists in making a "micrograph." Some known bacteria—say typhoid germs—are placed on gelatine and exposed to sunlight, but with the word 'typhoid' cut in cardboard letters placed on the top. The cardboard excludes the sun over a certain portion, and it is found that the bacteria which are exposed to direct sunlight cannot develop. The bacteria under the covered portion multiply, and as they develop print their name "Typhoid" on the gelatine plate.

It must be remembered that bacteria are not always active. They are often dormant, as, for instance, in water which contains no food, and, again, when present as dry dust in the atmosphere. The two great things which are needed are food and moisture, and, given these, their powers of multiplication are soon developed. Nature has largely restricted them to scavenging duties, and allows them comparatively free scope only so far as it relates to the bodies, whether of animals or of plants.

The effect of bacterial life is seen all around us. As the bacteria feed, so they produce chemical changes which alter the face of Nature. Whatever work is done, the bacteria give rise to numerous products which affect the original food stuff. Briefly, the products, which are called ptomaines, are:—

(1) Pigments (as a rule produced by innocent microbes).
(2) Gas, such as H, CO_2, CH_4, or
(3) Acids, such as lactic, acetic, butyric, &c.
(4) Liquefying ferment.
(5) Phosphorescence (as evidenced in the glow produced in sea water by myriads of animalculæ).
(6) Organic chemical products.

Bacteria are directly engaged in many industries influencing the flavour of various productions. Some of the dangerous forms of bacteria have to be guarded against to avoid their work of harmful decomposition. Many industries have been inaugurated to circumvent the decomposing bacteria, such as the building of ice-houses, salting fish, smoking hams, canning fruit, &c.

A large army of bacterial workers are told off to do the scavenging work of the world. Bacteria believe in the utilisation of all matter, and do not allow the resources of Nature to be wasted. By this means the ground is prevented from becoming unfertile. They seize upon anything that is dead and doing no work and convert it into suitable material for the life of plants.

Mr. Conn has prepared an interesting diagram illustrating Nature's food cycle and the part played therein by bacteria. Plants in the first case obtain their food (CO_2) from the air and water (H_2O), and another portion from the soil (nitrates). Plans by means of the sun's heat build these into complex matters such as sugar, starches, fats and proteids. These products form food for the animal world and help to build up the animal bodies. When they die the organic matter would not support plant life. The decomposing bacteria readily seize hold of the dead bodies, and break down the complex matter into simpler matters, such as CO_2, water, &c., which are available life, or into ammonia and nitrogenous compounds, such as nitrites, which are not capable of being absorbed by plants. To reduce these nitrites into nitrates, and then complete the food cycle, another form of bacteria are brought into operation. These are called nitrifying bacteria, and have the power of adding oxygen to the nitrites, thus converting them into nitrates which can be absorbed by plants.

During putrefaction a small portion of nitrogen is dissipated into the atmosphere, and for a long time scientists wondered how the soil was able to recover this lost nitrogen. If it were not recovered the soil must gradually get less fertile. It has been found that there are some forms of bacteria which have the

power of abstracting nitrogen from the atmosphere, and thus we see in Nature's scheme of perpetual motion in the food cycle that bacteria play a most important part and enable the soil to retain its fertility.

SEWAGE DISPOSAL.

Everybody now knows how bacteria have been harnessed by municipal engineers to carry out in a scientific way the work of sewage disposal. Two classes of bacteria are brought into the municipal service, and artificial conditions are created for their rapid multiplication, so that their work can be expeditiously done. The first class of scavengers are known as "anaërobics," and are used to break down and liquefy the sewage. As they work without the presence of oxygen, air is excluded by the best artificial means by the provision of tanks. The bacteria would cease action if left too long in their own products, and therefore a steady current is usually maintained through the tanks. When the preliminary stage is done the work is handed over to another class of bacteria called "aërobics." These bacteria work with oxygen, and accordingly filters or beds are provided and the air allowed to percolate through the interstices, so that the oxygen can be supplied to the bacteria. The work done consists in making the products from the previous process available for plant life.

The possibilities of this method of sewage disposal are being realised more every year. The great problem consists in making the best artificial conditions for the rapid multiplication of the necessary bacteria. The more quickly the bacteria develop the more quickly is the work of sewage disposal carried out. It is very difficult to regulate with scientific accuracy the time which should be allotted to the various processes, and to draw a hard-and-fast line between the various operations. In Nature the various operations are so dovetailed that it is difficult to know where one process begins and another ends. The sewage engineer is, of course, working under unnatural conditions, and therefore it is only by experiment that he can find the best means of harnessing bacteria for the work of sewage disposal.

Before concluding the author must briefly refer to bacterial slumland, as represented by such germs as those producing typhoid, diphtheria, small-pox, anthrax, &c. The knowledge of pathogenic or disease bacteria has revolutionised medical science, and the methods of curing many of our diseases consist in overthrowing the particular bacteria associated with the particular disease. The disease germs themselves are not especially offensive to the body, but when they obtain access to the body the bacteria produce poisons called toxins, which are most dangerous to human life. The body appears in a marvellous way to have the power of producing antitoxins to neutralise or overcome the effect of the toxins. It is the fact which has influenced the modern treatment of disease by endeavouring to impart immunity to the body by inoculation with antitoxins.

The author has now completed a very hurried tour of the bacterial world, and has left unexplored many hidden processes and manufactures which have an important bearing on our every-day life. Bacteria influence our health, our food, our drink, and almost everything we need. They are the scavengers of the universe, the fertilisers of the soil, the breeders of disease, the manufacturers of flavours and relishes of endless variety, playing an important part in Nature's perfect cycle of endless life and change.

DISCUSSION OF MR. RANSOM'S PAPER.

Mr. E. Willis (Chiswick) said he thought every member would agree that Mr. Ransom had put in very readable form the elementary principles underlying the science of bacteriology. On the question of sewage purification by anaërobic organisms, he thought further information would be much appreciated if Mr. Ransom could supply it. With regard to sterilisation it would seem that it did not cover all that at one time [illegible] Sterilisation was not what they wanted; what they actually needed was to cultivate organisms which were not harmful to the body. They should not be taught, try to sterilise milk and other [illegible] pathogenic organisms which were largely eliminated [illegible] keep their bodies healthy.

He [illegible] which seemed, and still [illegible] to be a very serious problem in connection with water supply and sewage disposal. At Cheltenham the problem was to derive pure drinking water from the Severn, which started with the surplus water from the Vyrnwy supply, and later went down to Worcester, where Mr. Ransom, by putting in bacteria filters, was producing an effluent that seemed all that could be desired. At Cheltenham they found that the effluent contained organisms, including typhoid germs, and the question arose whether Mr. Ransom should not sterilise the effluent in order that people might safely drink the water. They could deal with the peaty, black water, but that with bacteria from Worcester was more difficult. The same problem, in a more acute form, arose in London. Within the last few weeks Dr. Houston had proposed the excess lime method of sterilisation. He was out in Singapore a while ago, and there the water supply was derived from a gathering ground at the back of the town, where rubber trees grow. The question was discussed whether the rubber trees should be tapped or not, and the corporation was divided into tappers and non-tappers. The point was that if tapping was adopted they would have a number of coolies on the gathering ground, and as a natural result there would be pollution of the water, which was filtered by ordinary sand filters, which the medical officer did not consider would secure sterility. In considering works of sewage disposal they had to consider that it was not necessary for the water from such places to be up to the drinking water standard, and therefore he thought they should not insist on the Worcester people sterilising their effluent. On the other hand, they had to look at the problem as a whole, and must remember that the people of Cheltenham derived their water from the Severn. That brought him to this point—that those who were interested in this problem should further as far as they could the recommendations of the Sewage Commission to the effect that the different watersheds should be placed under the control of water boards, which would deal with the water problem as a whole, and would have as members experts on the questions to be dealt with. Attempts in this direction had been made, more or less successfully, in the West Riding of Yorkshire. That was the point which he wished to emphasise and commend to their support—that the results of bacteriological examinations pointed to the necessity of information in the different watersheds with a view to purifying water to the drinking water standard.

Mr. Kemp said that Dr. Rideal had suggested that Worcester might sterilise the effluent before it flowed into the river. At present Worcester had no effluent, for, pending the completion of certain works, the sewage had been discharged crude into the river. In order to see the effect of that he had had samples taken at Worcester above the outfall, and at the intake at the Cheltenham waterworks. To put it shortly, the water taken at Cheltenham was rather better than that taken above where the sewage was discharged.

Mr. E. G. Mawbey (Leicester) commended the paper for putting the question in so straightforward and simple a manner. One point he thought worth emphasising was the necessity of frequent collection of house refuse. Another was the influence of bacteria in connection with roads and streets. There could be no doubt that, especially in the densely populated districts, excreta and other foul matter got into the permeable road crust and there became breeding places for germs. Therefore there was no doubt they could do a great deal to preserve the health of towns by attending to the road surfaces and keeping them clean. The author said the effect of sunlight on bacteria was very marked. Did not that show how very important was 'own planning, and that it was desirable to have open spaces and wide thoroughfares, with houses so planned that they got a maximum supply of sunlight into the rooms? Ten or twelve years ago he carried out extensive experiments at Leicester with a view to finding out at what stage septic action set in. They found they could get better results so far as the effluent was concerned when they did not carry the septic action very far, and many were now coming round to the opinion that the extreme septicising of sewage was a mistake.

Mr. G. A. Hart (Leeds) said the paper had brought to his mind that they were engineers, and the less they knew of the intricacies of the question the better. What they had to do was to take the theories of another profession and put them on a utilitarian basis. The Royal Commission had given them a lead as to what particular direction they should expect legislation on the subject to take, but it would have been a great advantage to most of them if that lead

had been given in more concrete fashion. It was more than probable, however, that most authorities on inland rivers would have to deal with this question before they got legislation, and they would have to do the best they could under existing circumstances. As in the case of the larger authorities, expenditure amounting to something like a million might have to be incurred, it was a regrettable fact that there had not been greater standardisation and better collection of data, and standards better adapted to the respective watersheds. He did not suppose there would be any benefit in putting down empirical standards which would have to be revised, but it would be an advantage if the various localities were circumscribed in more confined areas. In the case of authorities which were situated on the outfalls of rivers it was a misfortune that they had to provide protection works, while those which were higher up were polluting the stream and handing down their output for the others to work upon. The question of sterilisation had been touched upon, and they had to consider how far sterilisation might be embodied in the science of bacteriology. He noticed that the author of the paper stated that "the purification of river water for public purposes chiefly consists in the removal of the majority of the bacteria." Sterilisation would be conducive to this effect, since it would remove them all. He presumed the author was referring to water in its pristine condition; if he referred to water into which sewage effluents were taken, and if they were to regard purification as meaning the removal of bacteria from all water into which effluents discharged, then purification was more or less a phantasmal dream. The function of the engineer came in when a decision had to be made as to which was the means of removing pollution, whether by sterilisation or by removing the cause, and so securing pure effluents. So far as knowledge of bacteriological science was concerned, he thought they should content themselves with acquiring the elements of that knowledge which science had built up. The less they entered upon controversial matter the better it would be for them.

Mr. Bainbridge said the works he was associated with supplied 105,000,000 gallons of water per week, of this 65,000,000 gallons came from a river and 40,000,000 gallons from two reservoirs, one behind the other. They took particular care in flood-water time to allow the flood water to go down the by-wash and collect the clean water. They got the water from a source on the moors where there were scarcely any houses, and certainly no villages. It was very easy for an expert speaker and clever writer to construct a convincing theory, but to put it into practice was not quite so easy. They had spent a very large sum, but they were not in possession of perfection yet. They had no fewer than eleven filter-beds, but all they got out of the water was sediment and colour. Combination of districts had been mentioned. That was what they had done, and it was certain that no poor district could have spent so much. What they should strive for was by means of combination to get purity; then they got healthy bodies, and bacteria had not half the power over them as over weaklings.

Mr. W. B. Chancellor (Lichfield) thought it most important that engineers should keep to their own line, and when it was necessary call in the chemical expert, who knew far more about these matters than themselves. He had found in his own practice that the advice experts had given had been the means of saving no end of money, and he was sure that if engineers before going into vast sewerage schemes would consult men who had made a life study of these matters the result would be satisfactory to them. With regard to the sterilisation of effluents, were they not likely to have a good deal of trouble after sterilisation? He knew of a case where they had great trouble, and he was told there was more likely to be decomposition in water that had been sterilised than in water that had not been so treated.

Mr. Stainthorpe (South Africa) was inclined to favour the view that engineers had plenty to do in their own profession without taking on themselves the work of bacteriologists. To begin with, no engineer had the time and opportunities at his disposal for the work. The proper course was that which he followed when he carried out a large sewage disposal scheme in South Africa. He always worked hand-in-hand with the Government bacteriologist, and got very good results. He was interested to hear what Mr. Mawbey said upon the length of time for tank treatment. South African conditions were different from what they had at home, and he found instead of allowing twenty-four hours for treatment in tank, six hours were sufficient. He did not know how that compared with recent practice here, but he quite saw eye to eye with Mr. Mawbey on this matter, and as the years went on he believed that the heavy cost incurred now for building supplementary tanks would be unnecessary.

The President agreed with the speakers who had urged it was desirable to have joint water boards. There was an example in that county where they had the Thames, with its own board, and in the North another watershed, with its own conservancy. The difficulty that arose from dealing with the varying conditions, added enormously to the work of the local authorities concerned, and entirely prevented that harmony and that co-ordination which were most necessary in dealing with this important subject.

The vote of thanks having been carried,

Mr. Ransom, in reply, thanked all the speakers who had taken part in the discussion on his paper, which was an attempt to deal with a subject bristling with difficulty.

(To be continued.)

INSTITUTE OF CLEANSING SUPERINTENDENTS.

ANNUAL CONFERENCE AT MANCHESTER.

Mr. R. Williamson, cleansing superintendent to the Corporation of Manchester, occupied the chair, in his capacity as president, at the annual conference of the Institute of Cleansing Superintendents, which opened in that city on Tuesday of last week.

In the course of an address to the members Mr. Williamson expressed pleasure at the continued progress of the institute. Reviewing the history of the organisation, he said that it was started in 1898 with 27 members. The membership was now 148, and ninety-seven towns were represented.

THE CLEANSING OF MANCHESTER.

"The Cleansing of a Great City" was the subject of a lecture given by Mr. A. Jennison, a member of the Manchester Cleansing Committee. The gross expenditure of the Manchester Committee, he said, was £200,000 a year, and of this £123,000 was paid in wages. About 80,000 tons of street sweepings and over 200,000 tons of domestic refuse were dealt with each year, and the value of this work, from the point of view of public health, was indicated by a drop in the death-rate of the city from 26 per 1,000 in 1891 to 17·12 in 1911. The manufacture of fertilisers—of which 2,500 tons per year was sold at £3 per ton—was explained, and the work on the Carrington and Chat Moss estates was described. These estates, Mr. Jennison said, had been converted from sterility to a highly fertile state, with roads, wharves, railways and modern farmsteads, with the result that sixty-four tenants now occupied the land and paid £7,170 a year in rent. The work of street cleansing was illustrated by many interesting slides, and described in detail. There were 540 miles of roadway in the city, Mr. Jennison said, and the surface swept each year reached the stupendous figure of 709,000,000 sq. yds.

[redacted]

In a paper on this subject, Mr. W. A. Bradbury, chemist and manager of the Manchester Committee's Holt Town Works referring to the disposal of clinker from the refuse destructors, said that last year a profit of £400 was obtained from the sale of mortar made from the clinker. As to stable manure, which, he said, was a notable breeding place for flies, he suggested that if during certain periods of the year the manure were dried by similar apparatus to that employed for the fertilisers, the eggs of the flies would be destroyed and the manure would be increased in value, but he was not prepared to say whether or not farmers would take kindly to the dry form.

[redacted]

Workmen's Cottages in Hadham Rural District.—A block of four cottages built under the auspices of the Hadham Rural District Council in the parish of Braughing, was opened recently. The cost of the structures, including land and well, has amounted to £600, and the accommodation provided in each cottage comprises a living-room, kitchen, scullery and three bed-rooms. Good gardens are attached to the cottages, which will be let at a rent of 3s. 6d. per week each. A loan has been sanctioned by the Local Government Board, the period allowed for repayment being sixty years. Mr. E. T. Watts, the surveyor, designed and supervised the erection of the buildings.

BUXTON'S THERMAL SPRINGS.

ST. ANN'S WELL ALTERATIONS.

Mr. Frank Langley, surveyor and water engineer to the Buxton Urban District Council, has lately carried out alterations and extensions to the famous St. Ann's Well in that town, and the completion of the work, which has involved an expenditure of £3,000, and which took three months to execute, was the occasion of some little ceremony, the reopening being performed by the Duke of Devonshire. In the course of the proceedings, Mr. T. H. Cooper, chairman of the Baths Committee, said he should like to take that opportunity of thanking the surveyor for the able manner in which he had carried out the alterations. The work had been done to the entire satisfaction of the council, and great credit was due to him.

The task with which Mr. Langley was faced was, it will readily be understood, somewhat exceptional in character, and serves as another instance of the varying duties imposed on or demanded from municipal engineers at the present day. The investigations of the "springs" required extreme care, as hasty excavations might have caused serious consequences, and no blasting was permissible in removing the limestone rock during the work. The "springs" have been aptly termed the "life blood" of the town—hence the responsibility in carrying out the scheme.

The scheme, as now carried out, encloses the colonnade, the spaces between the piers being filled in with ashlar dressings to form windows 5 ft. wide. The inner wall forming the colonnade has been removed and two brick piers formed to support steel girders spanning the opening and supporting the roof. The enlarged room measures 50 ft. by 35 ft. 9 in. There are two entrances, one at each end of the building frontage, the space under each dome being formed into a vestibule 8 ft. square.

The rear of the building has been raised; the portion previously walled off from the public view, and then containing gas engine, pumps and so forth, has been thrown into the room by the taking down of the main wall at the rear of the pump-room. Piers support steel girders spanning the opening thus formed, carrying the roof and back line of balustrade above it, these structural alterations being in unison with the most well-timed [illegible] building.

From Photo by St. Ann's Well, Buxton *Steward & Co., Buxton*

THE WELL CHAMBER.

[illegible] side of the well chamber a small room is formed, one to be used for the chalybeate spring and the other for the attendants. The floors of these rooms, which are on the same level as the public room, are enclosed on one side by a mahogany partition with bevelled plate glazing, and on the side to the well chamber by a low marble balustrade. The well chamber floor is reached from each of the above rooms by a flight of eight steps, formed in white marble and with ornate handrail.

MUNICIPAL WORK IN KRUGERSDORP.

TOWN ENGINEER'S REPORT.

In his latest annual statement Mr. R. A. Webster, the engineer to the Municipality of Krugersdorp, South Africa, comments on the absence of a storm-water drainage scheme in that town, and explains that as a result of this most of the channelling is of exceptional size, being designed, when a road is constructed, to take as much of the storm water as possible.

Mr. Webster reports the passing of an unprecedented number of building plans. The improvement in the class of buildings is still maintained, and the generally enhanced appearance of the various townships is very marked. In the business portions of the town and suburbs many elaborate and costly improvements and additions to business and other premises have been and are being effected.

Important developments have taken place in connection with the electricity department during the period under notice, and the large increase in the working has called for very strenuous effort on the part of those responsible. There has been a steady increase in the number of consumers, the total in September last being 580, an increase of 175 upon the previous twelve months. The number of 30 Watt lamps, or their equivalent, connected to the municipal mains was 12,250, equivalent to 367½ kw., there being an increase during the year of 3,679 lamps. There are eleven power consumers, having a total b.h.p. of 76, connected with the council's mains, taking current at power rate. The highest peak load recorded during the year was 225 kw.

In connection with the water-works, which are stated to be now working satisfactorily—Mr. Webster mentions that the following tariff of charges for meters has been adopted by the council: ¾-in. meters, 2s. per month; ¾-in. meters, 2s. 6d. per month; 1-in. meters, 3s. per month. The rentals for larger meters will be fixed by the council as occasion arises. The "Sandy" filters are in good order and continue to give satisfaction.

Business Announcement.—Messrs. Herbert Morris, Limited, of the Empress Works, Loughborough, Leicestershire, give notice that from August 5th to 13th next their works will stop for stocktaking and overhaul of plant. The offices will close for the yearly holiday. A limited number of the staff will be in attendance to deal with urgent matters. Orders for pulley blocks and other stock articles will be executed from stores as usual.

The St. Petersburg Destructor.—The extensive refuse destruction plant erected in St. Petersburg by Messrs. Heenan & Froude, Limited, to Manchester to consume 150 tons of refuse per day, is on the most approved mechanical stoking type. A slide is raised, withdraws the wood of the [illegible] from the cell in one operation, a work easily performed by one man, instead of by two as [illegible] in the old style. The material to be consumed is charged into the [illegible] by means of a continuous opening at the top of the cell, and a sliding door, [illegible] by means of a [illegible] is raised from the [illegible] floor, and the [illegible] promptly pushed into the furnace. Messrs. Heenan & Froude are erecting somewhat similar [illegible] at Cardiff, at [illegible] and Belmont.

ASSOCIATION OF KENT SURVEYORS.

MEETING AT FOLKESTONE.

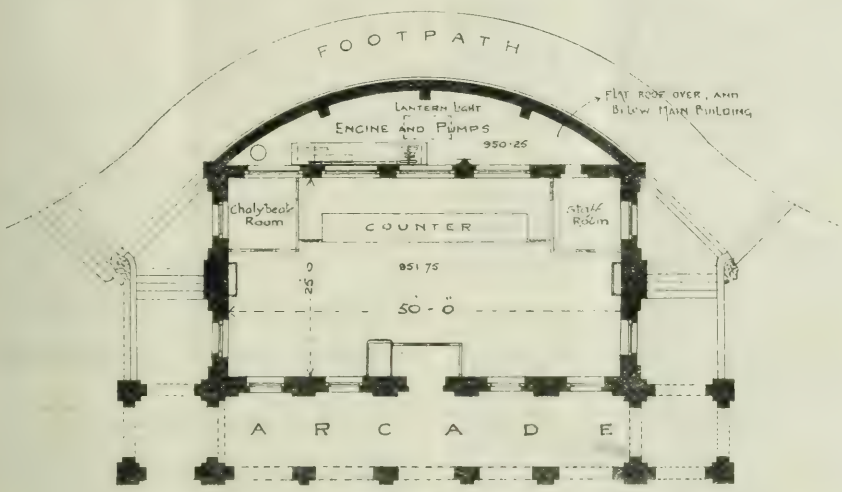
A meeting of the Association of Kent Surveyors was held at Folkestone by the kind invitation of Mr. A. E. Nichols, the borough engineer, on Saturday, June 29th, those present being: Messrs. A. E. Nichols (vice-chairman), F. Bunting, W. C. Hawke, H. W. Longdin, G. A. Butterworth, W. Banks, H. W. Barker, H. O. Jones, C. Conquest, W. L. Bradley, H. F. Jackson, F. D. McKenzie, T. A. Busbridge, and F. Harris.

The members assembled at the town hall and were received by his Worship the Mayor (Lieut.-Colonel Stephen Penfold, J.P.), who expressed his pleasure at meeting them and gave them a very hearty welcome. A tour of inspection was afterwards made of the district, the various systems of road treatment with tar and bituminous binders, etc., being examined, and the pleasure bath and the bottle of the cremation bottle, the fire station, refuse destructor—where very interesting work was being executed in concrete block making and a magnetic separator for removing nails, and so forth, was seen in operation—the meteorological department, the arrangements for sea bathing from the beach, suspension lamps for central street lighting, and the sewage outfall works all coming in for attention.

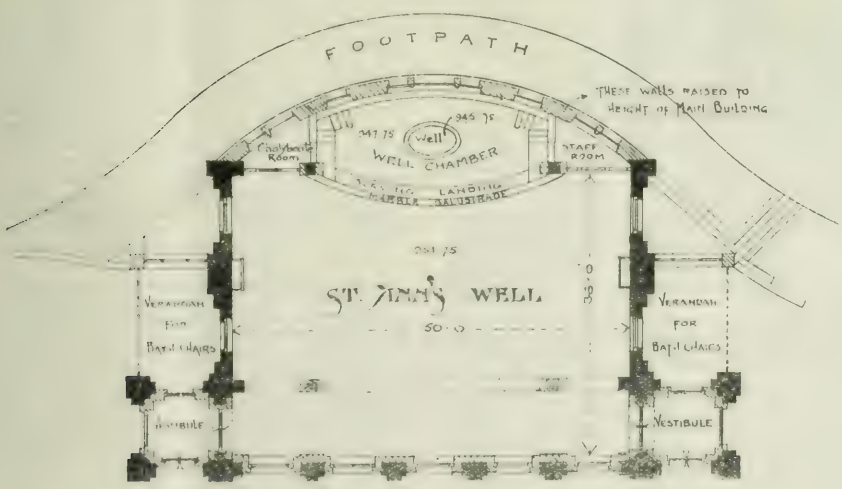
At the termination of the visits Mr. Nichols was heartily thanked for his kindness in arranging so pleasant and instructive a meeting.

New Water Supply for Aberystwyth.—Mr. J. Herbert Lewis, Parliamentary Secretary of the Local Government Board, inaugurated a new water supply for Aberystwyth last week. The work cost nearly £7,000, and includes a new service reservoir, with a 3,000,000-gallon capacity.

Road Ramming for Road Rolling.—A road rammer is being tried in France to consolidate broken stone with a view to saving time and labour as compared with the use of a steam roller alone. As described by Mr. C. Guillet, in the "Genie Civil," it consists of a number of rams, each weighing 3 cwts., and having a face of 1 sq. ft., which are raised about 2 ft. and then dropped. Four sections of road, each about ¼ mile long, have been consolidated in this way, and similar adjacent sections have been rolled in the usual manner. About 90 per cent of the stones before consolidation were too large to pass through a 1·18 in. ring. After ramming 60 per cent were still too large, and after rolling only 40 per cent were of that size. From the *Contract Record*.



Ground Plan (Before Alterations).



Ground Plan (Showing Alterations).

ST. ANN'S WELL, BUXTON.

NEW HAMPSHIRE HIGHWAYS.

GOVERNMENT INSPECTION AND REPORT: MILEAGES PER SQUARE MILE.

While the methods adopted by the United States Federal Government in its efforts to improve the road system of the Union are not necessarily those which would best repay attention in other countries, there is at the same time necessarily something, and possibly a great deal, to be learned from the study of a report such as that before us, made by a Superintendent of Construction of the United States Office of Public Roads (Mr. C. H. Hoyt), and embodying the results of his inspection of the New Hampshire highways in August of last year.

A large portion of the paper must be classed under the head of propaganda rather than as engineering literature, and many of the photographs with which the report is embellished, while they doubtless help to bring out points which are of interest to American citizens, are some of them little more than pleasing pictures illustrating the text in a somewhat vague manner, and without any special lesson for highway engineers. For instance, a picture of a bungalow, provided with hammocks, and situated beneath a shady tree at the side of a State-aid road, is intended to push home the lesson that "good highways and the automobiles make these resting places accessible"—that is to say, spend your money wisely on roads, and persons from the big towns will spend their money well in your State. But some of the illustrations are of distinct value, and important as illustrating the statements and arguments of the text.

It is worth while drawing attention to some of the facts and opinions to be found in the thirty-four pages of letterpress, especially those having a general application in addition to their local significance.

Under the head of "Maintenance," Mr. Hoyt writes: "All kinds of public highways that have ever been built require attention and repairs. Traffic requirements have become much more severe during the past five years than they were before that time. There is no such thing as a permanent road surface known to the human race. The word 'permanent' has been used largely and unwisely by those whom English writers describe as 'armchair' road builders, who are unfamiliar with the practical side of the question. The only features of road building that approach permanency in any considerable degree are the location, the grading, and the masonry structures."

With regard to small constant repair, he says: "The railroads do not employ section gangs to maintain their road-beds because it is necessary for them to proceed in that way, but because it is an economy for them to do so. When a boy tears his new coat it is usually considered economy to mend it before it gets torn worse. The same principle applies to highways."

Mr. Hoyt then draws attention to the fact that the patrol system has proved very successful in Europe, and he attributes the better condition of European roads as compared with those of the United States rather to superior maintenance than to better methods of construction.

For a description of the split-log drag and an explanation of the methods to be adopted in using it, the reader of this report is referred to Farmers' Bulletin 321 of the United States Department of Agriculture, and it may be observed in passing that split-log drag as used in America is a machine which is certainly of value to British engineers in many parts of the Empire for roads in the earlier stages of development.

It may be noted that the Summary of Recommendations includes, in addition to recommendations on administrative matters, the following as regards highway engineering: (1) The establishment of a patrol system under the supervision of a State engineer. (2) The use of the split-log drag on all earth and gravel roads. (3) The construction of reinforced concrete culverts to replace existing wooden culverts. (4) The use of hard stone in preference to gravel where there is a suitable quantity of stone and when sufficient funds are available. (5) The use of trap rock for the top course only where the local stone is suitable for the foundation course, and not for the top course.

The mileage statistics, which are of general interest, may be quoted almost in full, as follows:—

"New Hampshire has, according to the best data available, 15,116 miles of public highways, or 1·67 miles per square mile of area, which is a larger percentage than the average ratio for the United States, which is 0·75 mile per square mile of area. The ratios for the other five New England States are as follows: Maine, 0·85 mile, with a total of 25,528 miles; Vermont, 1·58 miles, with a total of 14,521 miles; Massachusetts, 2·12 miles, with a total of 17,092 miles; Rhode Island, 2·24 miles, with a total of 2,361 miles; Connecticut, 2·90 miles, with a total of 14,088 miles. For the remaining United States Arizona has the smallest ratio of all, which is 0·05 mile, with a total of 5,987 miles; and Connecticut has the largest ratio of all the States, as shown above. The district of Columbia has a ratio of 3·18 miles, with a total of 191 miles, but this can hardly be compared with the condition in other States, because the city of Washington occupies a very large part of the entire district. The State of New York has a ratio of 1·54 miles, with a total of 73,798 miles; Illinois has a ratio of 1·6 miles, with a total of 94,141 miles; California has a ratio of 0·29 mile, with a total of 46,653 miles; Florida has a ratio of 0·34 mile, with a total of 17,374 miles; Texas has a ratio of 0·46 mile, with a total of 121,409 miles, which is the largest total mileage for any of the States.

"There is another feature of these highways that is interesting, and that is their condition. Of the reported total, 2,151,570 miles of highways in the United States in 1904, only 7·14 per cent, or 153,662 miles, were reported improved—that is, indicating that they were in good condition. Of these 153,662 miles, 108,233 miles were reported to have been improved with gravel, 38,622 with crushed stone, and 6,807 with other material, such as oyster or clam shells or other material. At that time (1904) New Hampshire was reported to have 1,293 miles of improved highways, or 8·55 per cent of the total mileage of the State. Of this amount 1,175 miles were reported improved with gravel and 118 miles with crushed stone. These figures are not given because they are considered accurate, but because they are the best obtainable."

An interesting point with reference to traffic is that the roads have a much heavier traffic in one portion of the year than in the other. "Many of the roads receive the greater part of their traffic during a period of about five months—from the middle of May until the middle of October. A traffic census recently taken by the State engineer shows that nearly 50 per cent of automobile traffic on the two days that the census was taken were out-of-State cars. The three trunk lines, now nearing completion, pass through many towns that have shown their public spirit and their pride in the State by contributing their share to the construction of these highways, which are used largely by automobiles from outside the State whose owners pay no taxes in the State and from which the towns mentioned receive no direct benefit whatever. Under the present law these towns are legally but unjustly bound to maintain these roads, to be ground to pieces and worn out by foreign traffic. The last Legislature relieved this condition to some extent by making a percentage of automobile fees available for this work."

Lecture on Reinforced Concrete.—On July 3rd and 17th Mr. W. Noble Twelvetrees delivered two lectures on "Reinforced Concrete" to the students of the Crystal Palace School of Practical Engineering. The first lecture dealt with the fundamental principles of reinforced concrete construction and the general theory of beam design. The second lecture was devoted to the principles underlying the design of columns, struts, arches, and other forms of structural elements, and to various aspects of practical construction in reinforced concrete. This lecture was illustrated by specimens of various types of reinforcing steel, as well as by models and photographs of works executed in the United Kingdom.

Watthour Meters.—Messrs. Siemens Bros. Dynamo Works, Limited, Caxton House, Westminster, S.W., forward a copy of a new publication dealing with the Siemens-Gs type Watthour meter. This meter marks a distinct step forward in meter construction, as all the working parts can be replaced without tools, and the replacement of any or all parts does not necessitate recalibration. The deterioration in accuracy of the meter can usually be traced to the wearing of commutator, brushes, bottom pivot, or jewel, these being the parts exposed to wear and tear. The original accuracy of the meter is restored on the worn part being renewed. The pamphlet is very fully illustrated, and shows clearly how the renewal of the parts is carried out.

THE DISSEMINATION OF WEATHER FORECASTS.*

By H. E. CARTER.

For some time past there have appeared at intervals in the pages of THE SURVEYOR letters regarding the effect of the weather upon the work of municipal and sanitary engineers. The keynote of the correspondence has been a plea for a wider and more efficient distribution of weather forecasts from the Forecast Branch of the Meteorological Office, and such support was given to the proposal that a deputation representing a large number of municipal bodies waited upon Dr. W. N. Shaw and urged upon him the importance of their views.

Mr. Harold G. Turner, assistant engineer and surveyor of Surbiton, was, we believe, the pioneer in this movement, and his proposal was that the daily reports and forecasts of the Meteorological Office should be supplied direct to municipal engineers, and through them to the public.

Mr. Turner's suggestion was at once approved by the following engineers and surveyors: Messrs. G. Bruce Tomes, C.E. (Barnes), A. B. Lismer, C.E. (Edmonton), H. C. Fread, A.R.I.B.A. (Esher and the Dittons), S. H. Chambers (Hampton), R. H. Jeffes, C.E. (Maldens and Coombe), G. Jerram, C.E. (Merton), H. T. Mather (Surbiton), and M. Hainsworth (Teddington).

Dr. Shaw, in replying to the suggestion, recognised that trustworthy information as to future weather changes was of great service to municipal engineers. The distribution of forecasts through the Press involves unavoidable delay, and direct distribution by telegram would be much more satisfactory. He continued: "The authorisation to exhibit harvest forecasts in post offices is a first step in this direction, but under present circumstances the cost of transmission of the telegrams has to be borne locally. I understand that in Germany and Denmark forecasts are transmitted regularly to all post offices or railway stations and there publicly exhibited. I believe that a similar arrangement in this country would soon develop into an important public service, and I therefore welcome suggestions from outside which show that there is a demand for such information. Without a public demand I cannot expect the organisation which the scheme would require to be forthcoming."

The matter at once appealed to a large number of municipal engineers, and Mr. Reginald Ryves contributed a lengthy statement, setting forth the arguments in favour of such a scheme, which he regarded as a large economic gain to the country as a whole. He drew attention to the disadvantages of occasional forecasts, and said, concerning the financial position: "An annual expenditure of £10,000 would allow of telegrams being sent to about 2,000 post offices daily, supposing the post office to charge 3d. each, which should be a liberal allowance for telegrams sent in a short, simple and easily used code. If the reader would take the trouble to mark down the share of these for any part of the country he will find that the telegrams would be brought within a few miles of almost every spot, and could be brought within a very short distance indeed of the greater part of the population. As, however, farmers and small holders are the classes that benefit most from such telegrams, it is well not to lay stress upon the latter fact, but rather to make the smallest maximum distances the measure of the efficiency of the distribution. If we allow 5,000 stations for Ireland, Scotland and Wales, we are left with 5,000 for England. Taking as an example Staffordshire, which has an area of about one-twelfth that of England, and includes agricultural, pastoral, moorland and industrial areas, the allowance of 400 stations is ample, for it will be found that 350 stations command all parts of it with a maximum distance of about 3 miles. The distance is, of course, increased slightly in some parts, owing to the positions of the post offices, but there are so many ways in which the daily forecast would be passed on from mouth to mouth that this would not be a serious matter."

A regular use of the forecasts would certainly considerably reduce the losses now incurred without their aid. The agricultural community has long since realised the value of the special "harvest forecasts" prepared for their use, and the storm warnings have proved of enormous value to the mariner. The highway engineer and district surveyor would benefit considerably, especially as regards such public work as watering, sweeping, scraping and brushing the roads, the removal of snow, and the construction and maintenance of the public highways. A weather forecast available at, say, 4.30 p.m., and covering the ensuing twenty-four hours, would permit of to-morrow's work being arranged overnight, with due regard to the probable state of the weather. The value of the forecast is ever increasing as the percentage of successful forecasts has, during recent years, shown a gratifying advancement. In 1909 and 1910 the percentage of complete and partial successes reached ninety-three.

The energies of the pioneers in this movement, the work of the local Forecast Committees, and the publicity given to the matter in THE SURVEYOR, resulted in the subject being discussed by urban councils and various highways committees in all parts of the country. In almost all cases these bodies offered to co-operate in the effort to secure the benefits which the better dissemination of weather forecasts would bring. The council of the Royal Sanitary Institute passed a resolution in support of the proposition, but added a suggestion that an endeavour should be made to arrange for additional observations, so that the Meteorological Office may be able to reduce the size of the areas for which the forecasts are now given.

Mr. Frank Harris, engineer and surveyor to the Tonbridge Rural District Council, did not hesitate to say that the forecasts are not sufficiently local and definite to be of any material service. While such a statement is hardly borne out by the experience of others, there can be little doubt that the adoption of the suggestion of the Royal Sanitary Institute would enhance the value of the forecasts.

* From Symons's *Meteorological Magazine* for July.

Twickenham Proposed New School.—At a meeting of the Twickenham Education Committee on Monday there was adopted a committee's report which involves a scheme for the erection of a new school, at a cost of £11,000.

Large Reservoir for Buenos Ayres.—In connection with the sanitary improvement scheme which is now being proceeded with by the authorities of the City of Buenos Ayres, and for which no less a sum than £3,500,000 has been sanctioned by the national executive of the Argentine Government, a contract has recently been awarded the Cleveland Bridge and Engineering Company, Limited, of Darlington, for the manufacture and erection at Caballito, near Buenos Ayres, of an elevated reservoir, which will rank as by far and away the largest of the kind ever built in any part of the world. Water is to be drawn from the River Plate and pumped into the reservoir, which will consist of three tiers of wrought-iron tanks, supported on cast-iron columns embedded in heavy concrete foundations. The total capacity of the tanks will be 16,000,000 gallons.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, assoc.m.inst.c.e.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

This week answers are invited to the following questions:—

QUESTIONS.

252. Girder Bridge. Design a girder bridge to carry a 24-ft. road over a river and railway (at an angle of 60°) of two spans, 70 ft. and 42 ft. respectively. The mean height of road surface above bed of river is 21 ft. 6 in., and 17 ft. above rails, and the foundation is clay. Please show calculations and give an estimate of the cost. ("Nomad.")

260. Refuse Disposal. Where there is no system of sewers in a district, what are the best methods of collecting, removing and disposing of the fluid and solid refuse from the community?

261. Deflection of Beams.—If two precisely similar beams of rectangular section, one of cast iron and the other of wrought iron, were laid across the same span and loaded with the same load (within the elastic limit), what would be the relative deflections of the two beams?

262. Wood Paving.—What contour should be given to a wood-paved (soft wood) road 60 ft. in width? Describe the best method to adopt in fixing the screeds. (A. B.)

263. Floor Construction.—Give sections showing clearly the construction of a double floor and a framed floor respectively. ("Junior.")

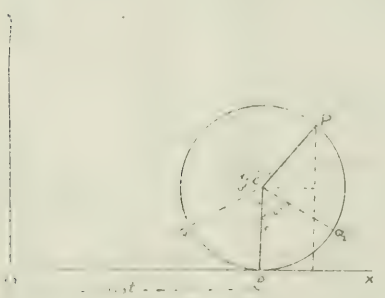
264. Concrete Beam.—A concrete beam reinforced with steel rods is to be designed to carry a distributed load of 20 tons. The span is 15 ft. Show by calculations what size of beam you would use—the method and formulæ to be as simple and short as possible. ("Greenland Farm.")

REPLIES TO QUESTIONS.

259. Mechanics.—What is meant by "Instantaneous centre of rotation"? Give an example. What points on the rim of a carriage wheel are moving at the same rate as the middle of the axle? ("A.M.I.C.E.")

The following reply has been received since our last issue:—

When a rigid body moves from one position to another in the same plane, its total displacement may be produced by a simple rotation about a certain fixed point in the plane. When these positions are successive—that is, when the time taken to move from one to the other is infinitesimal, or rather when



the angle turned through is infinitely small the point about which the rotation is made is called the "instantaneous centre of rotation." For example, in the case of the carriage wheel the point which touches the ground has no velocity, for it relative to the axle has no vertical component and also as it had a horizontal component, the point of contact would be moving along the ground, which it does not do. Therefore the instantaneous centre of rotation is the point at which it touches the ground. Let the angular velocity of the wheel be w and the radius r. Then the linear velocity of the hub $= wr$, and the linear velocity of any point at a distance r from the point at which the wheel touches the ground (*i.e.*, from the instantaneous centre) is wr. Therefore the points on the rim which have the same velocity as the hub are at a distance r from the point which touches the ground. The same result may be arrived at by a slightly different but more general method, thus: Suppose the wheel (radius r) is rolling along the ground at a uniform speed, the angular velocity of the wheel being w. Take for axes of co-ordinates the ground-line and the line perpendicular to it through the point of contact at any particular time.

The initial position of P (say) is O.

After time t, the position of P is determined by

$$x = rwt - r\sin wt.$$
$$y = r - r\cos wt.$$

Differentiating with respect to the time

$$\dot{x} = rw - rw\cos wt = rw(1 - \cos wt).$$
$$\dot{y} = rw\sin wt.$$

∴ velocity of P is $rw\sqrt{(1-\cos wt)^2 + \sin^2 wt}$

$$= rw\sqrt{2 - 2\cos wt}.$$
$$= 2rw\sin\frac{wt}{2}.$$

Distance traversed by hub in time $t = rwt$.

∴ linear velocity of hub $= rw$.

∴ $rw = 2rw\sin\frac{wt}{2}$.

$$\sin\frac{wt}{2} = \tfrac{1}{2}.$$

∴ $wt = 60$ or 300.

∴ positions of P, where it has the same velocity as the hub, are Q_1 and Q_2, where

$$Q_1\hat{C}D = Q_2\hat{C}D = 60$$

i.e., where $Q_1D = Q_2D = r$ = radius of wheel.

(G. P. S., *Linlithgow.*)

256. Leak in Drain Pipes.—What is a reasonable amount of leakage to be expected in newly laid stoneware drain pipes of 6 in. and also 12 in. diameter? State the type of joint, average depth of trench, and class of soil. Is one gallon per mile of pipe per hour a permissible amount? ("Welsh.")

All new drains, whether 6 in. or 12 in. diameter, should have joints made to stand the water test with at least 3 ft. head of water, and no leakage, however slight, ought to be passed as sound. I think the depth of the trench and class of soil have nothing to do with the soundness of the drains. In jointing the pipes, the back portion of the socket must be filled with spun yarn (dipped into cement grout) for a depth of ½ in., and the remainder of the socket filled up with cement mortar (1 cement to 1 sharp sand), and trowelled off to an angle of 45 deg. Then any cement that has found its way into the pipes should be scraped out, and at least forty-eight hours should elapse before the test is applied, so as to give the cement sufficient time to set. If the trench is found to be very damp, then patent safety joint pipes may be used, which are now made by all leading manufacturers. As regards the one gallon per mile per hour permissible leakage, I am of the opinion that this ought not to be allowed. (W. D., *Dudley.*)

258. Roof Design.—Is it necessary or advisable to allow for expansion and contraction in a roof of 50-ft. span? What is a simple and efficient arrangement for such a roof, assuming that this is required? ("Student.")

In an iron roof truss of 50 ft. span it is not usual to make allowance for expansion and contraction as the movement between winter and summer temperatures is only about $\frac{7}{16}$ in. in 100 ft., and in case of a rise in temperature a roof truss can rise in the centre and so relieve itself.

A simple arrangement, if "Student" is afraid of any expansion or contraction is to have the roof well constructed, so as to keep it at as even a temperature as possible. (W. D., *Dudley.*)

Law Notes.

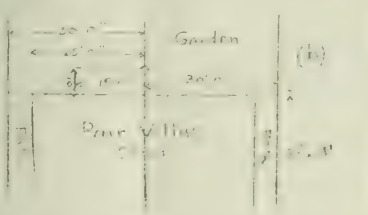
EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries which should be written legibly on foolscap paper, one side only, should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of plans or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without redrawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion queriists are requested to use distinctive words as nom-de-plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

BY-LAWS AS TO SPACE PAVING. "I. R." writes: The by-laws of a local authority provide as follows: "Every person who shall erect a new dwelling-house shall cause not less than 150 sq. ft. of any open space provided in connection with the premises to be paved with hard impervious and proper materials, consisting of flagging or other suitable material, properly and closely laid upon a sufficient bed of good concrete, or of other suitable material and properly jointed or with good cement concrete, or with good asphalt on a proper foundation, and so sloped to a properly constructed channel as effectually to carry away all rain and waste that may fall thereon. He shall cause such paving to be so arranged that it shall adjoin the external wall in the rear or at the side of the dwelling-house, so that, wherever practicable, it shall extend throughout to a distance of not less than 10 ft. from the said wall, and that, subject to this last-mentioned requirement, it shall extend as nearly as conveniently may be to the full width of the open space. For the purposes of this by-law the expression 'width' means in the case of



paving in the rear a measurement taken parallel to the rear external wall of the dwelling-house, and in the case of paving at the side a measurement taken at right angles to the side external wall on which such paving may abut." (*a*) Does this mean that either a builder must have a width of 10 ft. parallel with the rear external wall until he exhausts the 150 sq. ft. of paving asked for? Say, the width of a building plot is 30 ft., will a width of paving 10 ft. by 15 ft., or half-way across the plot, satisfy the by-law if the dwelling-house is 25 ft. across? (*b*) If the house is 30 ft. from front to rear, and the builder paves a 4-ft. path along the side external wall, making 120 ft. of such paving, would a strip a foot wide parallel with the rear external wall of 30 ft. suffice to make up the 150 sq. ft. to be provided? Or, in other words, if a builder elects to pave along the side external wall, must that not be taken into account in arriving at the 150 ft. to be covered with impervious paving, and if the quantity fall short of that amount, is he in any way compelled to provide more, parallel with the rear external wall, than will make up the required amount?

(*a*) The by-law is somewhat peculiarly worded, but I think it would be satisfied if a paving space adjoining and extending 10 ft. from the rear external wall and having a width of 15 ft. were provided. The words requiring "hard and open space provided in connection with dwelling-house" are important. The regulations of the by-laws with respect to the proportion that open spaces are to bear to the area to be covered are not affected by this proviso. (*b*) The exemption that "no open space contains more than 150 sq. ft.—otherwise how can 150 sq. ft." of the open space be paved? It would appear, therefore, that a path at the side of the house building site would not count as such an open space as required by the by-laws, and that a builder must pave 150 sq. ft. in any case, whether the path is an open space or not. The arrangement suggested in the query would not satisfy the by-laws.

NATIONAL INSURANCE ACT, 1911. "Yarn" writes: Will you kindly let me know whether the following are compulsorily insured under the Act? (*a*) Carters.—The carter employed by a haulier is paid by the week, who, as a rule, are given work in turns and paid by the day. (*b*) Lamplighters. The public lighting is by contract (not corporation), and the contract is let for a term of years. The lamplighters are employed by the contractor during the time up to the light-up time. (*c*) Market Hall Keeper. A person is engaged by the council as mart hall keeper and office cleaner (the latter of which he sublets), and is paid quarterly. He however devotes most of his time as inspector of waterworks, which is owned by a private company.

I assume that the Insurance Commissioners have satisfied that the terms of employment are such as to secure provision not less favourable than the corresponding benefits assigned by the Act to the insurable class, and that the employed persons are entitled to exemption under section 1 (2) of the Act. I think these are within the Act, and that the contracts "of service" within the meaning of the Act, but if it is the employed persons must apparently be insured. (*c*) Market Hall Keeper. The same question does not arise, but there is room for doubt as to the fact that the employed person has not passed the greater part of his time in the duties of office-keeper. Generally, the Act bristles with difficulties, and the only way to obtain an authoritative solution of the above and any other questions is to write to the Insurance Commissioners for their decision.

RURAL DISTRICT SURVEYOR: EXTRA REMUNERATION: PERCENTAGE.—"Per Cent" writes: Under the terms of my appointment as rural district surveyor I have a small amount of sanitary work to carry out, and my salary is apportioned as regards one-tenth for this work. Recently the council, wishing me to undertake further sanitary work, decided to pay me 5 per cent on the cost of works carried out in excess of £20, and passed a resolution to that effect. Will you please advise me whether this arrangement is legal, and, if not, how can I get paid? The amount of work fluctuates, and the council would probably not consent to an annual increase of salary, as in some years there might be no increase of work.

This arrangement is clearly illegal under sec. 193 of the Public Health Act, 1875 (see Stone's Practice, 1912, p. 1637). The only way, apparently, in which the result can be attained is for the council to increase the surveyor's salary for a specified period, the period and the amount of the increase being so calculated as to make the actual benefit equal to that which would accrue if the proposed payment were made in a lump sum. But the period for which the increase of salary is awarded must be prospective *i.e.*, must commence not sooner than the date of the resolution of the council awarding such increase. See Tomlin's Public Health Acts, 7th Edition, p. 550.

BY-LAWS: SCHOOL PREMISES: PLANS APPROVED BY BOARD OF EDUCATION.—"Velox" writes: Will you kindly inform me as to whether it is now necessary for architects to deposit plans with local authorities for new schools or additions to schools if the plans have received the approval of the Board of Education? I have it in my mind that a clause in one of the Acts passed last year makes it unnecessary for plans to be deposited if the approval of the Board of Education has been obtained.

It is not necessary. See s. 5 of the Education (Administrative Provisions) Act, 1911, by which the provisions of the by-laws made by any local authority under sec. 157 of the Public Health Act, 1875, as amended by any other Act, with respect to new buildings (including provisions as to the giving of notices and deposit of plans and sections), and any provisions in any local Act dealing with the construction of new buildings, and any by-laws made with respect to new buildings under any local Act, shall not apply to the case of any new buildings being school premises to be erected, or erected, according to plans which are under any regulations relating to the payment of grants required to be, and have been, approved by the Board of Education.

EXTENSION OF DRAINAGE.—"Beacon" writes: A rural district council, some twenty-three years ago, constructed a [illegible] which drained the sewage from seven adjoining cottages. [illegible] period, the rural council are desirous of constructing [illegible] sion. Will you kindly state whether or not the [illegible]

In my opinion [illegible]

We have to draw the attention of queriists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Ballymoney R.D.C. (July 19th. Mr. Barnewell Crofton).—£9 129 for the erection of fifty-five cottages.—With regard to past operations under the Labourers Acts in this rural district, it was stated that 310 cottages had been built. The total amount of loans under the Labourers Acts was £64,532. Mr. Albert M'Master, the council's engineer, gave evidence as to the plans of the cottages and the suitability of the various sites selected.

Barrow T.C. (July 16th. Mr. T. C. Ekin).—£22.000 for the purposes of the electricity undertaking, and £1,250 for the purchase of land adjoining Greengate-street, for the extension of the Ramsden-street storeyard.—The town clerk, Mr. L. Hewlett, stated that the period asked for the loan of £1,250 for the storeyard extension was sixty years. The storeyard in use at the present time was purchased in 1882, when the population of the borough was 48,000. For some three or four years past it was found inadequate for its particular purpose. With regard to the application for £22.000 for the extension of the electricity undertaking, the period asked for the loan was twenty-five years.

Kenilworth U.D.C. (July 9th. Major J. Stewart).—£3,700 for the provision of a cemetery.—The proposal is to purchase three freehold fields at Roselands, and part of the land will be retained for the present for allotments. It was estimated that the total ground to be bought will last the district for sixty years.

Paignton U.D.C. (July 10th. Mr. Courtenay Clifton).—£397 for the purchase of land adjoining Dartmouth-road near its junction with Thomas Down-road for the purpose of a refuse tip.—Mr. C. O. Baines, surveyor, said the average depth of the land was 186 ft., and it was estimated that, as a tipping ground, it would last about ten years. Adjoining the road it was 2 ft. below the road level, running back to 9 ft., where it was of marshy formation.

Ramsgate T.C. (July 12th. Mr. F. O. Stanford).—£4,178 for the erection of a shelter and lavatories on the East Cliff.—Mr. G. Thorn Drury, barrister, instructed by the town clerk (Mr. A. Blasdale Clarke), stated that the shelter was estimated to cost £3,257 and the lavatories £1,921. Ramsgate, he said, like other places round the coast, existed, and must necessarily exist, to a large extent, upon the entertainment of persons who came to such places either for health or pleasure. There was, and always must be, a certain competition among the various towns to render their districts more attractive to visitors, and it was with those points in view that the corporation had decided upon that application. There had been for some time a constant demand for some shelter on the East Cliff. Mr. T. G. Taylor, borough engineer, explained the plans in detail.

Rhyl U.D.C. (July 16th. Mr. P. M. Crosthwaite).—£7,500 for the purchase of the pier. The total sum involved by the scheme, however, is £52 000, the Board of Trade having already sanctioned a Provisional Order giving the council authority, with the board's approval of plans, for the spending of £50,000 on the repairing, widening, and extending of the pier.—The town clerk, Mr. A. Rowlands, stated that the council had been granted a lease of the pier and land adjoining for seventy years at a rental during the first five years of £25, after which the rent would be £75 per annum. As soon as sanction was obtained to buy the pier, it had been definitely decided to proceed with the repairing, and afterwards with the extending. There was no doubt that Rhyl must have a pier where steamers could land. He added that during June, July, and August no fewer than 220,000 visitors were brought to Rhyl by rail alone. There was considerable opposition to the application.

Shanklin U.D.C. (July 9th. Mr. H. R. Hooper).—£1.500 for the acquisition of the Literary Institution for municipal purposes.—The surveyor, Mr. E. C. Cooper, who had prepared schemes for the conversion of the building, stated that that which was most favoured was the proposal for carrying up the annexe buildings.

APPLICATIONS FOR LOANS.

Bridlington T.C. £4,700 for workmen's dwellings.

Cambs C.C. £710 for the extension of school premises.

Driffield R.D.C.—£500 for a water supply for Nafferton.

Hampstead B.C.—£11 000 for the electricity undertaking.

Hoylake and West Kirby U.D.C.—£1,775 for private street works.

Keighley T.C.—£7 500 for the extension of public baths, and £7,900 for parks, recreation grounds, and street improvements.

Maldon T.C.—£5 680 for the erection of thirty-two dwellings.

St. Ives T.C.—£993 for defraying expenditure at the beach, purchase of foreshores, and erecting a fire brigade station.

Southend T.C.—£6,020 for making up certain streets and £1,192 for a storm-water sewer.

Southport T.C.—£10 000 for an additional intercepting sewer to provide for the development of Birkdale and Ainsdale.

Tiverton T.C.—£4,400 (in place of £3,450) for street widening.

LOANS SANCTIONED.

Dungannon U.D.C.—£4,200 for the provision of twenty-four working-class houses, repayment to be made in sixty years.

Hastings T.C.—£2 219 for paving with creosoted deal blocks.

Kenilworth U.D.C.—£260 for a street improvement.

Kingston (Surrey) T.C.—For the purposes of the electricity undertaking: £10,327 for generating plant, fuel pipe, fuel tanks, extensions to sub-stations, &c.; £1,459 for extension of engine-room; £864 for new switchboard. The board stated that in arriving at the sum of £864 they had deducted £850 in respect of the debt outstanding on the existing high-tension switchboard, they being advised that a stand-by switchboard was not necessary, and that it was undesirable that the existing board should be retained, as it was out of date and dangerous. The town clerk, Mr. Harold A. Winser, has been instructed to request the board to reconsider their decision in regard to the switchboard.

Mansfield T.C.—£1,000 for the purchase of land for a recreation ground.

Okehampton T.C.—£922 for street widenings.

Runcorn R.D.C.—£1,664 for the conversion of privies into water-closets.

Salford T.C.—£17 000 for a secondary school for boys.

Selby U.D.C.—£3,200 for the erection of fifteen working-class dwellings.

FORTHCOMING INQUIRIES.

JULY.

	£
30.—**Audenshaw.** For street and sewerage works (Mr. F. H. Tulloch)	
30.—**Barnard Castle.** For street, water and sewerage works (Mr. H. R. Hooper) ...	2,971
30.—**Grimsby.** For sewerage and sewer ventilation purposes (Mr. F. O. Stanford) ...	2,410
30.—**Winsford.** For the purposes of the gas undertaking (Mr. A. W. Brightmore) ...	3 500
31.—**Bexhill.** For sea defence works (Mr. H. Shelford Bidwell)	1,490
31.—**Bodmin.** For works of sewerage (Mr. P. M. Crosthwaite)	
31.—**Chorley.** For water supply purposes (Mr. F. H. Tulloch)	600
31.—**Godalming.** For works of paving and surface-water drainage (Mr. A. W. Brightmore)	4 552
31.—**Rotherham.** For depot and sewerage purposes (Mr. F. O. Stanford)	2,400

AUGUST.

1.—**Alfreton.** For street widening and reservoir purposes (Mr. F. O. Stanford) ...	2,100
1.—**Rotherham.** For privy conversion purposes (Mr. F. H. Tulloch)	8,604

2.—**Shoreham.** For the purchase of the town hall (Mr. Edgar Dudley)	2,200

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Birmingham, Bradford £46,500, Broadstairs £3,500, Norwich £14,766; housing and town planning—Bradford, Bridlington; roads and materials—Exmouth £20,000; sewerage and sewage disposal—Milton £10,750, Runcorn £18,500, Walsingham £10,055; water, gas and electricity—Bournemouth.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Ammanford U.D.C.—The tender of Mr. E. Powell, of Whitchurch, near Cardiff, at £386, has been accepted for the erection of a retaining wall at Craiggoch, to prevent incursions of the river Amman into the park.

Birmingham T.C.—The award of the assessor, Mr. A. N. Bromley, of Nottingham, in regard to the plans for the projected baths at King's Heath places Messrs. Crouch, Butler & Savage, of Newhall-street, Birmingham, first, and the premiums go to Messrs. S. N. Cooke & W. N. Twist, Colmore-row, and Messrs. Round & Weaver, Newhall-street.

Bradford T.C.—The Tramways Committee have decided to recommend the corporation to erect a new large central tramway depot, at a cost of £46,500.

Broadstairs U.D.C.—Consideration is being given to a proposal to erect a glass and iron pavilion, at an estimated cost of £3,500.

Camberwell B.C.—The Public Health Committee recommend the council to approve the plans submitted by the borough engineer, Mr. W. Oxtoby, for the proposed new buildings in connection with the cleansing station at Peckham Park-road depot, and that the construction of these buildings be carried out under the supervision of the borough engineer, at the cost estimated by him—*viz.*, £575.

Cambs C.C.—The council have accepted the tender of Messrs. Kerridge & Shaw, at £9,449, for the construction of new county offices.

Devonport T.C.—A retaining wall is to be erected for the open-air bath at Mount Wise, at a cost of £879, and twenty-four dressing-boxes provided, at a cost of £320.

East Grinstead U.D.C.—A new fire station has been completed, at a cost of £600, from plans prepared by the surveyor, Mr. W. E. Woollam.

Greenock T.C.—The council have adopted the minute of the Law and Finance Committee recommending that the erection of public baths and wash-houses be proceeded with as shown on a plan prepared by the master of works.

Greenwich B.C.—The provision of public baths for East Greenwich has been referred to the Adoptive Acts Committee.

Holland (Lincs) C.C.—The Roads and Bridges Committee recommend the council to make a grant of £2,000 towards the cost of a new bridge at Boston. The bridge is estimated to cost £6 500.

Keighley T.C.—Subject to the Local Government Board sanctioning the necessary loan, the following tenders have been accepted for the extension of the public baths in Albert-street: Mason's work, Paul Rhodes, Leeds, £2 937; joiner's work, J. Driver & Son, Keighley, £122; plumber's, T. Atkinson, Keighley, £632; painter's, Eli Thompson, Keighley, £93; slater's, Wm. Thornton, Keighley, £157; plasterer's, £752; concreter's, Jno. Cooke, Huddersfield, £841; filtration plant, Royles, Limited, Manchester, £610.

Montrose T.C.—The outbreak of dry rot in the public library is apparently more serious than one would have anticipated, judging by the report prepared by the burgh surveyor, Mr. S. L. Christie. The lending department and ladies' and juveniles' reading-rooms are the parts affected, and they are more or less totally [illegible]. The [illegible] is estimated at £900.

Norwich T.C.—A scheme for the concentration of the municipal offices has been agreed to, and a decision come to to erect new offices on the fish market site on the lines of the scheme of the city engineer, Mr. A. E. Collins, at an estimated cost of £12,800.—A new fish market is also to be erected according to the plans of the city engineer, at a cost of £1.966.

Penistone U.D.C.—The offer of 1 000 yds. of land for a site for public offices has been accepted by the council.

Rowley U.D.C.—The tender of Mr. J. Bridgwater, at £1,012, has been accepted for alterations at the Old Hill council school.

Wallasey T.C.—The scheme of the architects (Messrs. Briggs, Wostenholme & Thornely) for the new town hall on the North Meade site has been considered by the council in committee. The exterior is designed in the Renaissance style, and is of a monumental character. The total cost is estimated at £102.500.

Wandsworth B.C.—The Highways Committee recommend that the London County Council, who are to reconstruct the bridge carrying High-street over the river Wandle, be asked to re-erect in Wandsworth Park or in the proposed extension of Wandsworth Common portions of the existing bridge as a relic of old Wandsworth.

HOUSING AND TOWN PLANNING.

Bradford T.C.—The Health Committee have resolved to ask permission of the council to negotiate for the purchase of a suitable site for the immediate erection of 200 workmen's dwellings, to let at a weekly rental not exceeding 4s. 6d., and to be within the distance of a penny tram ride of the centre of the town. It is proposed that, instead of borrowing the money required for the scheme in the open market, the committee should apply to the council for a loan at a low rate of interest and on easy terms of repayment from the accumulated profits of the corporation trading departments.

Bridlington T.C.—It has been agreed to promote a scheme, estimated to cost £4,700, for the erection of twenty-four workmen's dwellings, necessitated by the demolition of many cottages for street improvements, and by the likely demolition in the near future of fifty houses in the vicinity of the Priory Church. The proposed rents are from 5s. 6d. to 6s. per week.

Burnley T.C.—It has been agreed to buy, at a cost of £19,000, 177 acres of land surrounding Townsley Park, which, with the ancient hall, is already the property of the corporation. This purchase is the first step in a town planning scheme.

Lurgan U.D.C.—The estimated cost of a housing scheme adopted by the council is as follows: Expenditure—cost of erecting fifty-four houses, £7,339 11s. 9d.; purchase of sites as per conditional agreement, £1,193 15s.; formation of footpaths, boundary walls, sewers, and water-main extension, £364; architect's fees, £108; assessor's fee for adjudging competitive plans, £21; clerk of works, £78; legal expenses, advertising and printing, £100; contingencies, estimated at 10 per cent on £8,010, £801—£10,005 11s. 9d. Estimated outlay (first year)—interest on £10,000, at 3½ per cent, £350; yearly repayment of principal (sixty years), £166 13s. 4d.; rates on fifty-four houses (estimated at £5 10s. each), at 7s. in the £, £103 19s.; property tax, £15; rent collection, £25; fire insurance, £6; upkeep and vacancies, £75—£741 12s. 4d. Estimated income (first year)—weekly rents, at 3s 9d. per house, £526 10s.; loss, £215 2s. 4d.—£741 12s. 4d. In the event of the council receiving a grant of £130 from the housing fund created under the 1908 Act, the nett loss will be £85.

Ripon R.D.C.—The council have approved the resolution of the Yeovil Town Council, that it is desirable that the Housing Acts should be amended so as to enable local authorities to borrow money from the Public Works Loan Commissioners for the construction of streets for the same period as is at present allowed for land—*viz.*, eighty years—and that the rate of interest should be £3 per cent.

Valley (Anglesey) R.D.C.—It has been agreed to consider in committee of the whole council that a site of 6¾ acres be acquired from the Cayley Trustees at Rhos, and that the surveyor take into consideration the provision of fifty cottages on the land.

PARKS AND OPEN SPACES.

Birmingham T.C. The Parks Committee propose to ask the council shortly for permission to acquire from the corporation water department a site of 11 acres between Aldridge-road and Walsall-road, for the purposes of a recreation ground for the residents on the Perry Bar side of the districts of Birchfield. Of the 11 acres 7 form a reservoir which would be suitable for boating.

Smethwick T.C.—The trustees of the donor (the late Sir James Timmins Chance) last week formally handed over to the corporation the deeds of the park at West Smethwick. The area of the park was originally about 43 acres, but this has been added to, while Mr. George F. Chance has given £1,500 towards the endowment fund.

REFUSE COLLECTION AND DISPOSAL.

Bath T.C.—The Sewering Committee have accepted the tender of Messrs. Hughes & Stirling, at £3643 [illegible] of the new refuse destructor to deal with 90 tons per twenty-four hours.

Lambeth B.C. The council have adopted a recommendation of the Wharves and Cleansing Committee to utilise the Rommany-road site for a destructor, and for the erection of other buildings. The scheme, it was recently reported, would result in fifty-six additional stokers, trouncers, carmen, &c., being employed, at a cost approximately of £4,226 per annum. The total cost of the buildings was estimated at £25,361, machinery £9,586, making a total of £34,947. It was estimated that with the destructor house refuse could be collected and disposed of at a cost of £5,038. This meant a saving of £957, as against contracting out. Slop refuse could be disposed of with a saving of £1,426.

Merthyr T.C.—The Health Committee have recommended that scavenging contracts be extended from one year to three years; that a system of night scavenging be carried out in the Merthyr Town district for six months as an experiment; and that the borough be divided into six districts for the purpose of scavenging instead of thirteen as at present.

ROADS AND MATERIALS.

Aberdeen C.C.—The road surveyor of the Ellon District Committee reports that the roads throughout the district, with some slight exceptions, have been maintained in good order during the past year, and evidence is now being shown of the advantages of applying superior materials, even although the initial cost was greater. A coat of metal of good quality lasted much longer, kept a proper surface when wet, and was freer from dust in dry weather. The system recently adopted of commencing with large stones under [illegible] as much could be done with, he considered, on the main roads, but a satisfactory foundation to get for the coat of metal, and it will also provide for the widening of the metalled surface with the necessary convexity.

Barnstaple R.D.C.—The General Purposes Committee, reporting on the question of giving assistance to the highway surveyor, Mr. A. Richards, in regard to the supervision of the roads, recommended that two foremen should be appointed to work under Mr. Richards's direction, at a salary of 25s. a week each. The Rev. A. B. S. Wrey moved the adoption of the recommendation, and Mr. Isaac seconded. The Rev. J. Dene did not think they would get the proper men at 25s. per week, but the chairman said the clerk had a letter from a man who had been on the engineering staff of Lord Iveagh, who would come for 30s. a week. The Rev. J. Dene thought the man they wanted would be a contractor, who had been a steam man at his calling. Mr. Andrew thought it an extravagant expenditure. Mr. Buckingham pointed out that the county council would not give them the establishment charges they did unless they could show proper supervision. The committee's recommendation was carried by twenty-three votes to three.

Bath T.C. With respect to what is known as the Orange-grove improvement the Sewering Committee have decided to recommend a modified scheme, which involves the clearing of the site of the houses already demolished to the Grove level, the building of a retaining wall and the continuation of the ornamental balustrade from the Grand-parade. This will cost £1,650.

Camberwell B.C.—The Works and General Purposes Committee recommend the council to support the resolution passed by the Chelsea Borough Council requesting that the Local Government Board be asked to promote legislation for securing a reduction of the maximum weight of traction engines and to make a regulation requiring that the wheels of traction engines and heavy motor cars shall be fitted with resilient tyres, and that the London County Council be asked to support this request. They have also requested the London County Council to make a by-law under sec. 6 of the Locomotives Act, 1898, prohibiting, or at least restricting, the use of locomotives on those highways where the nuisance and annoyance were chiefly felt.

Derbyshire C.C.—It has been agreed that the wages paid to adult roadmen and labourers employed by the council shall not be less, when full time is made, than £1 per week.

Exmouth U.D.C.—A scheme, by which Exmouth will be provided with a marine drive a mile in length, has been submitted to the council. The cost of the proposal, which will include a 65-ft. wide carriage drive from the Coastguard Station to the old rifle butts at Orcombe Point, will be £20,000, of which the council will be called upon to provide £8,500, Lord Clinton contributing the remainder. The details of the scheme were prepared by the surveyor (Mr. S. Hutton) and a small committee.

Finsbury B.C.—The following paving works are to be carried out during the half-year ending March 31, 1913: Goswell-road, between Dolby House and Sydney-street, carriageway with Aberdeen granite cubes, £543; Pentonville-road (south side), between Medcalf-place and Claremont-square, repave carriageway with Aberdeen granite cubes, £499; total, £1,042.

Glamorgan C.C.—Revised plans of the proposed Baglan-road diversion have been presented, the work being estimated to cost £7,093.

Islington B.C.—Mr. Didsbury, at a recent meeting, moved the following notice of motion: "That it be referred to the Works Committee to consider the present arrangements for watering the roads, so that the water carts shall not be withdrawn in consequence of a slight fall of rain, thereby leaving the roads unwatered during hot, dry days." Mr. Batty said that when the carts were withdrawn there was every indication of further falls of rain. Did Mr. Didsbury want the water-cart men to take shelter during a shower and then come out with their carts again? It was fortunate for Islington that Mr. Didsbury had not got control of the carts. Watering the roads cost £70 a day, and if the borough engineer could save £35 by withdrawing them in the afternoon he should do so. It was hazardous to forecast the weather, but only twice in the year had Mr. Barber's judgment been wrong.

Kingston (Surrey) T.C.—For the supply of granite kerb, channel and setts, and quadrants, the tender of Messrs. Wethern Bros., Limited, has been selected from eight submitted.

Leeds T.C.—A proposal has been made to spend £131,000 on improvements in connection with the extension of the infirmary, the scheme including the making of a new road, 60 ft. wide, from Calverley-street to Fenton-street. The scheme is to be submitted to the next meeting of the council.

Llandudno U.D.C.—Plans have been prepared for laying out the west front and enlarging the model yacht lake.

Mallow R.D.C.—A new road is to be constructed from Esk to the road leading to Donoughmore, at an estimated cost of £200.

Marylebone B.C.—It has been decided to communicate with the Local Government Board and the London County Council complaining of noise and vibration caused by heavy traction engines with trailers.

Merton U.D.C.—The Roads and Works Committee, having taken into consideration the question of watering private streets, reported that, having regard to the estimates of the surveyor, Mr. G. Jerram, as to the cost involved, they felt unable to make any recommendation in the matter during the present season.

Norfolk C.C.—The Joint Committee report that they have considered the question of the contributions to urban authorities for road tarring which had been referred to them by the Eastern Highways Committee, and have resolved to recommend that the contributions to be paid by the county to the urban districts for tarring the main roads in their districts be increased from 50 per cent. to 75 per cent., provided that before

any tarring is undertaken the proposed scheme is submitted to the county surveyor for his approval.—The county surveyor, Mr. T. H. B. Heslop, has reported that the roads which have been reconstructed under the Road Board grant are now in the best condition for tarring, the cost of which would be £634, being 1½d. per yard super. Although the Road Board refused in the first instance to grant anything for road tarring, they are now prepared to grant ¾d. per yard, which, in this case, will amount to £317, leaving a balance of £317 to be found by the county council.

Okehampton T.C.—The council have adopted the plans of the borough surveyor, Mr. F. J. Worden, for the widening of Mill-lane. If the roadway is made 24 ft. wide, it will be necessary to acquire 10,050 ft. of land.

Perthshire C.C.—It has been arranged to lay down tar-macadam through the villages of Comrie and Blackford, at an estimated cost of £1,414, these being main trunk thoroughfares, and the first half of the grant for the work has been obtained from the Road Board. The grant from the Scottish Office in aid of cost of maintaining roads in the Central District of the county for the past year amounted to £380, and the grants from the Road Board were £889.

West Bromwich T.C.—The Highway Committee of the West Bromwich Council recommend the purchase of a strip of land about 50 sq. yds. fronting to Great Bridge-street, near Slater-street, for the purpose of widening the street. They also recommend the acceptance of the tender of Messrs. Clough, Smith & Co. for the removal of the tramway poles from the centre to the sides of the road.

SEWERAGE AND SEWAGE DISPOSAL.

Brierley Hill U.D.C. The tender of Messrs. John Guest & Sons, of Ambleeote, at £3,115, has been accepted for the carrying out of house connections.

Cambridge T.C.—A sewerage extension, to cost £9-0, is to be carried out in Trumpington-road.

Coventry T.C.—The accounts of the sewage farm for the past year show a loss of £1,797 as compared with a loss of £1,106 on the previous twelve months.

Dorchester T.C.—It has been decided to change the present treatment of the sewage to that of broad irrigation. A 15-in. rising main will be laid from the proposed pumping station to the new irrigation area. The motive power will be suction gas plant, with engines and treble action ram pumps.

Hampton U.D.C.—The council have under consideration a scheme to make provision for the drainage of Hampton Court Palace at a cost of £1,500.

Hastings T.C. A sewer is to be constructed at Old Roar Valley, under the direction of the borough engineer, Mr. P. H. Palmer, at an estimated cost of £1,230.

Milton (Kent) R.D.C.—A report by the Rainham Drainage Committee recommending the purchase of a site for the sewage outfall works, consisting of 5 acres, for £1,062, has been adopted. The committee recommend the slate bed system of sewage treatment. The estimated cost of installing the drainage system is £9,400, which, with the cost of the site for the outfall works, and other items, gives a total of £10,750. Mr. L. B. Grant, of Sittingbourne, has been appointed engineer at an inclusive remuneration of £400.

Oswestry R.D.C.—A scheme for a supply of water to the Morda part of the district, including the construction of an additional reservoir, has been prepared by Messrs. Berrington. The estimated cost is £1,450.

Runcorn R.D.C.—A sewage disposal scheme for the Warrington suburb, estimated to cost £18,500, has been approved.

Southport T.C.—Plans have been approved for the sewering of and the construction of sewage disposal works for Birkdale and Ainsdale, at an estimated cost of £62,975.

Walsingham R.D.C.—The tender of Messrs. W. Brigg & Co., of Bradford, at £10,055, has been accepted for the construction of sewage disposal works.

WATER, GAS, AND ELECTRICITY.

Ammanford U.D.C. The tender of Mr. Pritchard Davies, Ammanford, at £615, has been accepted for the extension of water mains in various new streets.

Bournemouth T.C.—Gas lighting is to be substituted for electric lighting, and it is proposed that the gas lamps should be fixed on the tramway standards.

Dingwall T.C.—The Local Government Board have intimated to the council the urgent necessity of taking steps to improve the quantity and quality of the water supply.

Celligaer U.D.C.—A committee has been appointed to consider alternative schemes for the provision of gas or electricity undertakings.

Hornsey B.C.—It has been agreed to fit the existing lamps in Rathcoole-parade and Tottenham-lane, between Church-lane and Rosebery-gardens, with double Nico burners, at a cost of £24 18s. 9d. The additional annual cost of maintenance will be £24 17s. A similar improvement will be effected in High-street, Hornsey, between Turnpike-lane and Birkbeck-road, at a cost of £21, and an additional annual cost of £22.

Kingston (Surrey) T.C.—For the building extension to be carried out at the electricity works, and for the construction of machinery foundations at the works, the tenders of Messrs. Kavanagh & Co., at £1,200 and £787 respectively, have been accepted. The only other tender opened, that of Messrs. Powley Brothers, was withdrawn, owing to a mistake in the estimate.

Midlothian T.C.—There was a loss on the electricity undertaking last year of £941.

Oystermouth U.D.C.—Steps are being taken for the transfer of the Mumbles water undertaking to the council.

MISCELLANEOUS.

Kingswinford R.D.C.—The Coronation Committee have decided to purchase fire hose and appliances for presentation to the council.

Skegness U.D.C.—A new steam fire engine is to be purchased, at a cost of £288.

Motor Cars for Fire Brigade Superintendents.—London Fire Brigade superintendents are to be provided with motor cars instead of one-horse visiting traps, the Fire Brigade Committee of the London County Council considering that the proposal will materially increase the efficiency of the brigade.

An Opportunity for Assistants and Town-Planning Experience.—We learn from our correspondent that he has now considered the applications forwarded to him, and has communicated with two of the applicants with a view to their joining him in about a week's time. He will select two more directly the gathering of the crops gives access to the land for contouring work.

A Regal Scavenger. John William Johns, a Westminster street scavenger, was on Thursday, at the London Sheriff's Court, awarded £180 damages, with costs, against the British Motor Cab Company for injuries through being knocked down by a taxicab. Special damages were asked for, as it was claimed that he was making among clog-dancers "and his injuries would prevent him earning money in the exercise of that art.

Problems in Engineering.*—This reprint from the popular students' section of our contemporary consists chiefly of questions that have been set at the examinations of the Institution of Civil Engineers and of the Institution of Municipal and County Engineers. There is no index to the work, but the matter is classified under the heads of Mechanics and Hydrostatics, Strength and Elasticity of Materials, Theory of Structures, Surveying and Levelling, Water Supply and Hydraulics, Sewerage, Sewage Disposal, Road Making and Tramways, Building Construction and Materials, Law, and Miscellaneous. This book is calculated to be of considerable use to students in these subjects, but it would have been an advantage if the source of the questions could have been stated. The answers have in general been given rather more fully than would be the case at an examination, with the object of explaining the principles to a student without his having to refer to a text-book for them. The price brings the work within the reach of all students, and there is so much useful matter compressed into a small space that even the best-prepared candidate cannot afford to be without it.—*Sanitary Record.*

* "Problems in Engineering, with Solutions." Being Questions and Answers reprinted from the Assistants' and Students' Section of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER. First Series, 1909-10. Edited by Sidney G. Turner, ASSOC.M.INST.C.E. Price 5s. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

PERSONAL.

Mr. R. A. Ferguson, county surveyor for the Northern Division of Donegal, has resigned, owing to ill-health.

Mr. J. H. Hill has been appointed sanitary inspector (not surveyor and sanitary inspector as at first reported) to the Ripon Corporation.

Mr. William G. Bartlett, of the engineer's and surveyor's department, Herne Bay, has been appointed clerk in the borough surveyor's office, High Wycombe.

Mr. A. Gordon Kilner, surveyor to the Sedbergh Rural District Council, has been appointed highway surveyor to the Wetherby (Yorks) Rural District Council.

Mr. R. S. Scott, who has completed twenty-five years' service as surveyor to the Bishop's Stortford Urban District Council, has been presented with a silver salver by the members of the council.

Mr. W. Hadley, surveyor, and Mr. S. Wallis, inspector to the Kettering Rural District Council, have each been voted a sum of £25 per annum towards the cost of maintaining motor cycles, to facilitate travelling over their district.

Mr. Robert Stubbs, surveyor to the Holme Cultram (Cumberland) Urban District Council, has sent in his resignation, to take effect from September 28th next. Mr. Stubbs has held office since 1874, and his resignation was received with regret.

Mr. Stewart Blount, jun., assistant to his father, the surveyor to the Market Harborough Rural District Council, was cycling down Bunker's-hill, near Market Harborough, on Thursday of last week, when a fowl ran into his machine. He was thrown to the ground, and received a fracture of the skull. He died shortly after his removal to his home at Laughton.

Major W. W. Crosby, consulting engineer, of Baltimore, has been made a Doctor of Science by the Maryland Agricultural College, in recognition of his work for the improvement of the highways of the State. On his retirement recently from the position of chief engineer to the State Roads Commission he was presented by his office staff with a silver loving cup. Major Crosby's successor is Mr. Henry G. Shirley, roads engineer of Baltimore County.

Prof. Arthur H. Blanchard, M.AM.SOC.C.E., who, as was stated in THE SURVEYOR of July 5th, has been appointed consulting highway engineer to the Board of Water Supply of New York City, has been retained in connection with the construction of the 40-mile highway which will encompass the new Ashokan reservoir. Mr. Blanchard has also recently been appointed consulting engineer to the Borough of Manhattan, of New York City, on sheet asphalt pavements, and consulting highway engineer to the New York State Highway Commission.

Mr. Archibald Currie, the city engineer of Westmount, Quebec, was born in Glasgow forty-three years ago, and was educated in that city at the West of Scotland Technical College, graduating in 1890. For three years he was assistant engineer with Sir John Aird & Sons, the well-known contractors, and then accepted an engagement with the Chinese Government as resident in charge of important engineering works in the North of China. When Admiral Sir Edward Seymour made his famous attempt to relieve the European Legations in Pekin in 1900, at the time of the Boxer uprising, Mr. Currie was his chief engineer, and for his services in this connection he received a medal and clasps. Later he was for nine years in South Africa spending six of them in Johannesburg, where he was in charge of electric railway, drainage, and road construction. Upon returning to Great Britain Mr. Currie was engaged as consulting engineer on water supply works and similar enterprises in Ireland, Scotland and Wales. Going to Canada a year or two ago, he was appointed to succeed Mr. F. L. Fellowes, now city engineer of Vancouver.

Tramway Trailer Cars for London.—The House of Commons Committee considering the London County Council's Tramways Bill on Wednesday decided to pass the clause empowering trailers, or coupled cars, limiting them, however, to the south of the Thames and the Embankment and over Westminster and Blackfriars Bridges.

Motor Wagons for Johannesburg.—The Johannesburg Corporation have ordered four motor tip wagons for use in connection with the sanitary service of the town. It is estimated that one motor tip wagon will equal in efficiency and dispatch fourteen refuse carts. The wagons will be fitted with rubber tyres, each being of 4 tons capacity and 39 h.p.

FOR OTHER ADVERTISEMENTS
See End of Paper.

RAMSBOTTOM URBAN DISTRICT COUNCIL.

WORKS OF SEWERAGE AND SEWAGE DISPOSAL.

TO CONTRACTORS.

The above Council invite Tenders for the Construction of Earthenware, Cast-iron, and Pipe Sewers, with Manholes, Flushing Tanks, Storm Overflows, River Crossings, Pump Well and Pump House, Rising Main, &c., and also for the Construction of Detritus Tanks, Percolating Filters, Humus Tanks, and other appurtenant Works at the Sewage Disposal Works, Lower Summerseat, in connection with the Lower Summerseat and Brooksbottoms Sewage.

Plans and Specifications may be seen, and Bills of Quantities, Schedule of Prices, and Form of Tender obtained, at the Offices of the Engineers, Messrs. James Diggle & Son, 14 Victoria-street, Westminster, S.W., and Hind Hill-street, Heywood, Lancashire, on and after Wednesday, the 24th day of July, 1912, on payment of a deposit of £5, which will be returned on receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Sewerage and Sewage Disposal Works, Contract No. 22," addressed to the Clerk, Council Offices, Ramsbottom, are to be delivered not later than 9 a.m. on Thursday, the 15th day of August, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

JOHN W. BARLOW,
Clerk to the Council.

Council Offices,
Ramsbottom,
Lancashire.
July 17, 1912.

THE URBAN DISTRICT COUNCIL OF HINDLEY.

Applications are invited for the post of Assistant in the Surveyor's Office at a salary of £78 per annum.

Applications, stating age, qualifications and experience, accompanied by copies of not more than three recent testimonials, endorsed "Assistant Surveyor," must be sent to the undersigned not later than Tuesday, the 20th August, 1912. Candidates must have had previous experience in the department of a Surveyor to a local authority.

Canvassing for the appointment will be considered a disqualification.

(By order)
THOMAS ROBEY,
Clerk to the Council.

Council Offices,
Hindley.
July 24, 1912.

BOROUGH OF RICHMOND, SURREY.

A fully qualified Temporary Assistant is required for a few months in the Borough Surveyor's Office, in connection with the preparation of the Council's Town Planning scheme. Salary £3 per week.

Applications, with copies of two testimonials, stating age, particulars of previous experience, &c., to be sent to Mr. J. H. Brierley, Borough Surveyor, Town Hall, Richmond, Surrey, not later than Saturday, the 3rd August, 1912.

GOOD CLERK OF WORKS required by the Surrey County Council for erection of a Ferro-Concrete Bridge. Engagement about four months. Previous experience in ferro-concrete bridge construction and pile driving essential. Application, stating age and experience, with testimonials or references, and salary required, to Mr. A. Dryland, M.INST.C.E., County Surveyor, County Hall, Kingston-on-Thames.

THE USE OF CONCRETE IN ROAD CONSTRUCTION.*

By Logan Waller Page,
Director of the United States Office of Roads.

While much experimenting has been done with the object of making concrete available as a road material, the success which has attended its use as a foundation for town paving has not extended to surface work. "While this is true in general, yet there are isolated instances where concrete has been used for road construction with such a degree of success that complete success seems to be almost in sight. This fact alone, it seems to me, justifies an assumption that concrete can be made generally successful as a road material, provided sufficient care is used in the selection of materials, their mixing, laying, and curing, all of which necessitate skilled supervision."

It is too early to attempt to predict what will be the best method, but "Portland cement concrete has been used so successfully in nearly all forms of construction that it seems reasonable to expect that we cannot go far wrong in using concrete for a pavement if we adopt the best standard practice in use to-day for other types of construction." Practice usual in good concrete work should be followed, and the coarse aggregate should be such as will pass in any direction through a 1½-in. sieve, and be retained on a mesh of ¼ in. Probably a 1:2:4 mixture, or one of 1:3:5, will give good results in most cases. Since concrete which sets under water acquires greater strength than that which sets in air, it should be gauged fairly wet and the surface should be kept moist for one or two weeks. If possible, the surface should be protected from the sun by strewing over it loam, or even sawdust, straw, or shavings. A further opportunity for the concrete to acquire strength would be provided at a small additional cost by the application of a thin coat of bituminous material immediately after the temporary protecting layer has been swept off. An additional advantage of the bituminous coat would be its effect in preventing the cracks which are caused by a too rapid drying of the concrete.

As regards the provision for expansion and contraction, the best practice up to the present time seems to point to the provision of an expansion joint along each kerb, and a transverse joint at every 25 ft. Possibly the latter may be spaced further apart. A notable feature of the concrete pavement is its low cost of maintenance. Concrete pavements laid in 1907, and subjected to heavy traffic, have not required any expenditure in maintenance. "Figures collected by the Office of Public Roads relative to the cost of maintenance of plain macadam and bituminous pavements under fairly heavy traffic conditions indicate that these pavements, when properly maintained, entail an absolute maintenance charge of approximately $450 per mile per annum for plain macadam, and possibly from $800 to $1,000 per mile per annum for bituminous macadam, for 15-ft. surfaces. These figures have led me to believe that we must seek a more permanent form of pavements for country road surfaces. I hope that the concrete road will meet this requirement."

THE ADVANTAGES OF CONCRETE PAVING.

As regards the advantages of concrete paving, Mr. Page may be quoted at length:

"In the matter of sustaining normal loads the capacity of concrete pavements as compared with the capacity of ordinary macadam or bituminous macadam surfaces must be superior. Numerical data and experimental evidence on this subject are as yet meagre. It is not difficult, however, to draw certain definite conclusions when we consider the nature of the materials involved. It is well known that macadam roads have rutted under heavy loads. For ruts to develop rapidly it is quite evident that some shearing of the macadam surface occurs. Of course, rutting also takes place, because of wear and lateral displacement of stone. The capacity of concrete pavements to resist shear is relatively much greater, and we may perhaps note this is the first point of superiority of concrete over macadam pavements for sustaining normal loads.

"It is common practice to assume, in designing concrete bridge floors, that normal pressures over an area are transmitted through the slab in lines of pressure whose boundary surface is conical, with elements at an angle of 45 deg. or more with the horizontal. It scarcely needs demonstration that the same assumption cannot hold for macadam slabs—i.e., normal pressure cannot be transmitted by a macadam slab over as large an area of the sub-grade—and this, it is reasonable to record, is a second advantage of concrete over macadam construction.

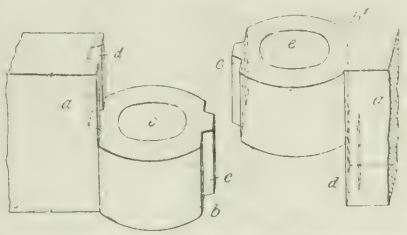
"We may, if we choose, compare concrete road surfaces with macadam road surfaces, assuming that each is an arch between kerbs. It is not difficult to see that concrete is superior as an arch in the following way: Consider the entire sub-grade carefully removed from a macadam road surface; there is some doubt as to whether the macadam surface would stand alone. On the other hand, it is easy to see the complete concrete slab crown not only standing after the removal of the sub-grade, but to also see this arch of concrete sustain considerable load without a sub-grade, so that we must admit the third superiority of concrete roads over any macadam construction in their action as an arch to sustain normal pressure."

Mr. Page concludes that, taking into consideration possible increases in the severity of traffic conditions, concrete may be a suitable and economical material for country roads.

* Points from a paper read before the American Association of Portland Cement Manufacturers.

INTERLOCKING REINFORCED SLABS AND PILES.

An interesting booklet showing the possibilities of this system has been issued by the Patent Interlocking Slab Company, of Oakley House, Bloomsbury-street, W.C. The slabs have overlapping or interlocking lugs, which have tongued and grooved connections with the abutting slab. The interlocking joints are provided with perforations so that when a number



The above sketch shows in perspective the adjacent or interlocking ends of two slabs. The tongues e lock into the grooves d; through the eyelets c are inserted reinforced concrete piles or columns, thus rendering the joint connection rigid and secure.

of slabs are assembled they may be securely locked together by means of circular reinforced concrete piles or columns, secured in the ground and passing through the perforated lugs. The invention is applicable for all manner of constructional purposes, including groynes, quays and sea walls, river retaining walls, and canal banks and culverts, and a large saving is claimed to be effected by its adoption.

Shorland's Manchester Grates. — The Sibertswold schools, near Dover, are being supplied with Shorland's warm air ventilating patent Manchester grates by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

Sink Waste.—Messrs. J. H. Sankey & Son, Limited, Essex Wharf, Canning Town, E., have issued an illustrated pamphlet descriptive of a simple but effective sink or bath waste, which has been designed to overcome the difficulties so frequently occasioned by stoppages. The device is fitted with a removable strainer bucket, which can be thoroughly cleansed in a few seconds.

Roads Improvement Association: Council Meeting.—Colonel R. E. Crompton, C.B., occupied the chair at the July monthly meeting of the council of the Roads Improvement Association held on Thursday, the 18th inst. The decisions of the Improvements Committee of the London County Council and of the Middlesex County Council in regard to the scheme for the provision of a new western exit from London were reported. The council noted, with regret, that these bodies had not definitely taken up the scheme, and it was resolved that the association should take further action in the matter. The various arrangements made in connection with the Roads Improvement Association's opposition before the Select Committee of the House of Lords to the London County Council's proposal to run trailer and coupled tramcars were reported and approved.

SOME RECENT PUBLICATIONS.*

The Road Material Resources of Minnesota. By George W. Cooley, Secretary and Engineer, Minnesota State Highway Commission.

This pamphlet presents in a convenient form the principal factors affecting road making and maintenance in the State of Minnesota. The introduction includes a statement of the principal geographical features of the State, some important meteorological data, and the numbers of counties and townships. The rock formations and drift deposits of the State are then described, and a list of quarries and stone-crushing plants is added. The locations of rock deposits are then indicated, with descriptive data, the limestones of the Mississippi Valley, the limestones and sandstones of the Minnesota Valley, the granites and quartzites found in the same valley, and other important deposits, including granite, quartzite, trap rock and slate. Our engineer readers will not be surprised to learn that an iron ore containing about 25 per cent of iron has been used with success, though the roads are somewhat dusty in dry weather, and carry a slight coating of red mud when wet. A description of the soil, which is called "gumbo," shows that it is a material similar to the black cotton soil of India, but has no counterpart in any important deposit in the British Islands.

The report includes a description of some experimental roads, including one a description of which is as follows: "Experimental Road No. 2 was built on 1 mile of State Road No. 7, in Sherburne County, near Princeton. The surface is approximately level, and the soil very sandy. For 60 ft. in width it was cleared and ploughed, and laid out in three strips of 20 ft. each. The middle strip was turnpiked for road purposes and covered with a layer of rye straw 3 in. thick. The outside strips were planted with red and yellow clover mixed with rye, which had been cut and raked on the road bed. Owing to the lateness of planting and exceedingly dry weather during July and August the clover did not grow well, but the experiment will be continued for several years with the expectation that the introduction of this vegetable matter into the sand will so change its character as to permit the use of ordinary road machinery with satisfactory results. Already, with only a few months' experience, the farmers who use this road speak very highly of it, and applications are coming in to the highway commission for a continuance of the plan."

There is nothing new in fact, though the fact is seldom recognised, in the incorporation of a small amount of rotting vegetable material into the crust of an earthy, sandy, or gravelly road.

Records of the Survey of India, 1909-1910. Vol. I. Prepared under the Direction of Colonel S. G. Burrard, C.S.I., R.E., F.R.S. Calcutta: Superintendent Government Printing (India).

For many years the annual report of the Survey of India consisted of two parts, (1) Abstracts of Results, and (2) Narrative Reports of Executive Officers. Since the year 1900-1901 the narrative reports have been published as a separate volume, entitled "Extracts from Narrative Reports." As these reports often include discussions of data, and since the volume will be hampered if it is confined to narratives, explanatory statements will be included in it, and it will in future be known as "Records of the Survey of India."

The volume before us contains about 140 pages of letterpress, of foolscap size. The first twenty-two pages are devoted to the Topographical Survey, the work of twelve parties. The areas surveyed included parts of the North-West Province, Upper Burma, the Shan States, and Assam. The maps which accompany these reports show the areas surveyed during the year, and those previously surveyed, and the same information is given as regards triangulation. The next part relates to "Triangulation," and is accompanied by a map of India, showing the year's work and that of previous years by means of blue lines. Part III. is the report of levelling work, including the revision levelling from Rangoon to Mandalay, which, after making allowance for all probable errors, seems to point to local subsidences, and one slight upheaval. Part IV., 8 pages, is the Geodetic Survey report, including pendulum operations, the object of which was to find whether a belt of relatively high density in the earth's crust, indicated by latitude observations, is visible, and a part of the topographical features, or is concealed beneath the surface. The report of the magnetic survey, with its tables, occupies some fifty-four pages, and that of tidal operations about twenty pages. The volume is provided with very well executed index maps, and several photographs, and is in itself a record of important advances in printing and reproduction work in India.

Laboratory Manual for the Use of Students in Testing Materials of Construction. By L. A. Waterbury, Prof. of Civil Engineering, University of Arizona &c. Price 6s. 6d. New York: John Wiley & Sons. London: Chapman & Hall, Limited.

This is an exceedingly useful book, and contains a mass of valuable and practical information in a compact form.

The question of testing the various materials now used in the construction of our roads and streets is becoming daily of more and more importance, and this work gives just the information required as to what apparatus to purchase and how to use it.

Profuse illustrations are given of the necessary apparatus, and detail instructions of the manner of procedure, so that a reader without any special laboratory knowledge could easily make tests of materials with the aid of this book. Take, for instance, the tests for bituminous materials. Full instructions and drawings of the instruments are given for such tests, as (*a*) penetration, (*b*) determination of carbon, (*c*) determination of volatile matter, (*d*) ductility, (*e*) determination of bitumen, &c., and the methods of operation in each case are given in detail.

The method of testing sand, gravel and stone are also given, such as (*a*) crushing, (*b*) abrasion or attrition, (*c*) toughness, (*d*) specific gravity, (*e*) percentage of voids, (*f*) absolute and relative sizes, and the like. The method of testing other materials—such as cement, concrete, iron and steel, wood and bricks—are also given, and it is surprising that in so small a volume so much useful and practical information could be compressed. We heartily recommend it to the attention of our readers.

* A copy of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th 11th and 12th of that month.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, Assoc.M.Inst.C.E., Borough Surveyor, Windsor.

NORTH-WESTERN DISTRICT MEETING AT CLITHEROE.

A meeting of the Institution of Municipal Engineers will be held to-morrow (Saturday), at Clitheroe.

Programme.

10.15 a.m.—Meet at Clitheroe Station and proceed on a round of visits to the following works:—
(1) Isis Cement Company's cement works.
(2) Horrocksford Lime Company's tar-macadam works.
(3) Messrs. R. Briggs & Son's stone quarries.
(4) Messrs. J. Carter & Company's stone quarries and tar-macadam works.

1 p.m.—Meet at the town hall, where members will be received by his Worship the Mayor, Alderman C. Mitchell, and Alderman Hardacre, chairman of the Highways and Waterworks Committee.

1.30 p.m.—Lunch.

2.30 p.m.—Wagonettes leave town hall for waterworks.

5.30 p.m.—Tea in the town hall, followed by—

6.30 p.m.—Meeting, when a paper, "Municipal Progress in Clitheroe," by Mr. A. R. Bleazard, borough surveyor, will be read.

Election of district officers.

George Hayes,
Hon. District Secretary.
147 Church-street,
Westhoughton, Lancs.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

ASSISTANTS TO COUNTY SURVEYOR.—July 27th.—West Sussex County Council. £130—£150.—Mr. H. W. Bowen, county surveyor, 23 North-street, Horsham.

CLERK OF WORKS.—About middle of July.—Essex County Council. £3 3s. per week.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

HIGHWAY SURVEYOR AND INSPECTOR.—July 27th.—Wantage Urban District Council. £140 per annum.—Mr. E. B. Ormond, clerk.

CLERKS OF WORKS.—July 29th.—For the construction of covered service reservoir of concrete.—Mr. W. Fiddian, civil engineer, Stourbridge.

FOREMAN.—July 29th.—East Grinstead Urban District Council. 30s.—35s.—Mr. W. E. Woollam, engineer and surveyor.

CHIEF ASSISTANT.—July 29th.—Corporation of Clydebank. £120 per annum.—The Town Clerk, Municipal Buildings, Clydebank.

CLERK OF WORKS.—July 29th.—Newburn Urban District Council. £2 10s. per week.—Mr. G. Wilkinson, clerk.

INSPECTOR OF NUISANCES.—July 29th.—Elham Rural District Council. £120 per annum.—Mr. B. C. Drake, clerk, Hythe, Kent.

PERMANENT WAY FOREMAN.—July 30th.—Pontypridd Urban District Council. £130—£150 per annum.—Mr. J. Colenso Jones, clerk.

OUTFALL WORKS SURVEYOR.—July 30th.—Clayton Urban District Council. 25s. per week.—Mr. B. Ashton, clerk.

FIRST ASSISTANT SURVEYOR.—July 30th.—Pontypridd Urban District Council. £100—£140 per annum.—Mr. J. Colenso Jones, clerk.

ASSISTANT OUTDOOR FOREMAN.—July 31st.—30s. a week.—Surveyor, Town Hall, West Didsbury.

ENGINEERING ASSISTANT.—August 1st.—Corporation of Salford. £104 per annum.—Mr. L. C. Evans, town clerk.

WATERWORKS INSPECTOR.—August 1st.—Corporation of Loughborough. 38s. per week.—Mr. Albert H. Walker, borough surveyor and waterworks engineer.

WORKING FOREMAN.—August 1st.—Ardsley Urban District Council.—Mr. C. McNaughton, clerk.

CLERK OF WORKS.—August 3rd.—Corporation of Hyde. £3 per week.—Mr. T. Brownson, town clerk.

ROAD FOREMAN.—August 3rd.—Kirkcaldy Town Council. 35s. per week.—Burgh Surveyor.

TEMPORARY ASSISTANT.—August 5th.—Easington Rural District Council. £3 per week.—Mr. G. Waterhouse, Easington, Durham.

CLERK OF WORKS.—August 5th.—Chesham Urban District Council. £2 10s. weekly.—Mr. P. C. Dormer, engineer and surveyor.

CLERK OF WORKS.—August 7th.—Matlock Urban District Council. £4 4s. per week.—Mr. R. Taylor, clerk. Prescribed application forms can be obtained on application to Messrs. James Diggle & Son, engineers, 14 Victoria-street, London, S.W., and Hindhill-street, Heywood, Lancs.

SURVEYING ASSISTANT.—August 10th.—Borough engineer's office of a large Midland town. £130.—Box 1,174, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

TEMPORARY TRAMWAY ASSISTANT.—August 10th.—Engineer's office of large Midland town. £140.—Box 1,173, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

ASSISTANT ENGINEER.—August 31st.—Darjeeling Municipality, India. 150 rupees monthly.—The Chairman.

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Mr. Laurence Gomme, clerk.

BUILDING INSPECTOR AND SURVEYOR'S ASSISTANT.—No date.—Paignton Urban District Council. £2 weekly.—The Surveyor.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

CARDIFF.—August 6th.—Designs and estimates for fire station.—The Town Clerk.

GOOLE.—September 1st.—Competitive designs and estimates for municipal offices, for the urban district council. Two premiums (£30 and £15).—Mr. R. Tyson, clerk.

CHORLEY.—September 9th.—Designs for a school, for the corporation.—Mr. J. Mills, town clerk.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas.—Mr. J. Henry Field, town clerk.

RANGOON.—Designs for the new municipal buildings. Honorariums of £300, £200 and £100 are offered.—Messrs. Ogilvy, Gillanders & Co., Sun-court, 67 Cornhill, E.C.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

CLITHEROE.—July 27th.—For repairs and decorating work at public buildings, for the corporation.—Mr. A. R. Bleazard, borough engineer.

KENT.—July 27th.—For repairs to county school, and alterations to technical institute, for the Education Committee.

STAFFS.—July 27th.—For the erection of a council school, for the Education Committee.—Mr. G. Balfour, County Education Offices, Stafford.

COVENTRY.—July 27th.—For extensions to the market hall, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

BURNLEY.—July 27th.—For the concrete work in the repair of the sewage tanks, for the rural district council.—Mr. H. Pritchard, engineer.

ROTHERHAM.—July 29th.—For repairs and asphalting work at a council school, for the Education Committee.—Mr. J. A. Mair, secretary.

WEST SUSSEX.—July 29th.—For the erection of school caretaker's quarters, for the county council.—Mr. L. Thompson, secretary, Thurloe House, High-street, Worthing.

PORTSMOUTH.—July 29th.—For works at the Municipal College, for the corporation.—Mr. A. H. Bone, architect, Cambridge-junction, Portsmouth.

NORTHWICH.—July 29th—August 14th.—For the erection of public baths and wash-houses, for the urban district council.—Mr. J. A. Cowley, clerk.

LLANDOVERY.—July 29th.—For the construction of new intake and filtering gallery, and laying steel main at the water supply works, for the corporation.—Mr. H. Alfred Thomas, town clerk.

PAISLEY.—July 30th.—For the erection of conveniences and gateway, for the corporation.—Master of Works, 13 Gilmour-street.

BIRMINGHAM.—July 30th.—For the erection of a tramway depot, for the corporation.—Chairman of the Tramways Committee.

HAMMERSMITH.—July 31st.—For the erection of sanitary conveniences, for the borough council.—Mr. H. Mair, borough surveyor.

MONTGOMERYSHIRE.—July 31st.—For improvements and alterations to a school, for the Education Authority.—Mr. L. Phillips, clerk, Newtown.

ST. HELENS.—July 31st.—For the erection of a public library, for the corporation.—Mr. A. W. Bradley, borough engineer.

BIRMINGHAM.—July 31st—August 26th.—For the erection of buildings in further extension of the council house, for the corporation.—Mr. E. V. Hiley, town clerk.

ILKLEY.—August 2nd. For the erection of an annexe to the King's Hall, for the urban district council.—Mr. F. S. Eckersley, clerk.

HAMILTON.—August 5th.—For the erection of new municipal offices, for the corporation.—Mr. P. M. Kirkpatrick, town clerk.

SOMERSET.—August 6th.—For the erection of an infants' school, for the county council.—Mr. C. H. Bothamley, secretary, Weston-super-Mare.

CHESHAM.—August 7th.—For the construction of an open-air swimming bath, for the urban district council.—Mr. P. C. Dormer, engineer and surveyor.

WEST RIDING.—August 9th.—For the erection of a school at Silsden, for the Education Committee.—Education Architect, County Hall, Wakefield.

ABERDARE.—August 10th.—For the erection of thirty-two tenement dwellings, for the urban district council.—Mr. T. Phillips, clerk.

HUNTS.—August 10th.—For the enlargement of a secondary school, for the Education Committee.—Mr. S. G. Cook, clerk, County Education Offices, Huntingdon.

MERTHYR.—August 12th.—For the erection of forty-eight dwellings, for the corporation.—Borough Architect, Town Hall.

SOUTHEND.—August 17th.—For the erection of a lodge and refreshment-room, for the corporation.—Mr. E. J. Elford, borough engineer and surveyor.

Iron and Steel.

BELFAST.—July 29th.—For the supply of steel pipes and specials, for the corporation.—Mr. R. Meyer, town clerk.

WOOD GREEN.—July 31st.—For the supply of unclimbable wrought-iron fencing and six pairs of gates, for the urban district council.—Engineer and Surveyor.

SALFORD.—July 31st.—For the supply and erection of cast-iron standards and wrought-iron gas tubing.—Borough Engineer.

VALETTA.—August 1st.—For the supply of pipes and castings, for the Director of Contracts.—Crown Agents for the Colonies, Whitehall-gardens.

BOMBAY.—For the supply of about 20 miles of steel pipes of about 48 in. diameter, for the municipality.—Mr. H. J. Trivess Smith, hydraulic engineer.

BEDLINGTONSHIRE.—For the supply of 100 yds. of 15-in. steel tubes, coated, in 18-ft. lengths, for the urban district council.—Mr. Charles D. Forster, joint clerk, 24 Grainger-street West, Newcastle-on-Tyne.

Roads.

BURNLEY.—July 27th.—For the execution of a road improvement, for the rural district council.—Mr. H. Pritchard, surveyor.

ORMESBY.—July 27th.—For making-up work in certain streets, for the urban district council.—Mr. Alfred H. Sill, 15 Albert-road, Middlesbrough.

WEST RIDING.—July 27th.—For kerbing, channelling, pitching, surface-water drainage, and walling, for the Highways Committee.—The County Surveyor, County Hall, Wakefield.

WITHAM.—July 29th.—For the use per day of steam roller and scarifier, for the urban district council.—Mr. W. P. Perkins, surveyor.

WITHAM.—July 29th.—For the supply of granite, for the urban district council.—Mr. W. P. Perkins, surveyor.

NEW SARUM.—July 29th.—For works of making up, for the corporation.—Mr. Francis Hodding, clerk.

EAST PRESTON.—July 29th.—For steam rolling the district roads, for the rural district council.—Mr. A. Shelley, clerk, Littlehampton.

CHESTER-LE-STREET.—July 29th.—For the construction of a new road, for the rural and urban councils.—Mr. W. Ayton, highway surveyor.

SWANSEA.—July 29th.—For the construction of a new road, for the rural district council.—Mr. E. Harris, clerk.

NEWBURN.—July 29th.—For making up certain streets, for the urban district council.—Mr. T. Gregory, surveyor.

BROMLEY.—July 29th.—For the supply of Guernsey or Leicester granite and basalt, for the corporation.—Mr. F. H. Norman, town clerk.

SALISBURY.—July 29th.—For making-up work, for the corporation.—Mr. W. J. Goodwin, city engineer and surveyor.

STRATFORD-ON-AVON.—July 29th.—For the supply of broken and unbroken road macadam, for the corporation.—Mr. Roden Dixon, borough surveyor.

WATFORD.—July 30th.—For making up certain footpaths, for the urban district council.—Mr. W. Hudson, clerk.

TYNEMOUTH.—July 30th.—For road construction work, for the corporation.—Borough Surveyor.

WOODFORD.—July 30th.—For the supply of granite and steam rolling, for the urban district council.—Mr. W. Farrington, surveyor.

BIRMINGHAM.—July 31st.—For the reconstruction of part of St. Margaret's-road, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

HAMMERSMITH.—July 31st.—For making up a thoroughfare, for the borough council.—Mr. H. Mair, borough surveyor.

HOVE.—July 31st.—For paving and other works, for the corporation.—Mr. H. H. Scott, borough surveyor.

LANARK.—August 1st.—For repairs to Craig-street, for the District Committee of the Middle Ward.—Mr. W. E. Whyte, district clerk, Hamilton.

BARNET.—August 1st.—For works of repaving, rekerbing and channelling in High-street, for the urban district council.—Mr. Henry W. Poole, clerk.

NEWCASTLE (Ireland).—August 1st.—For steam rolling main and district roads, for the urban district council.—Mr. D. Curran, town clerk.

BARNET.—August 1st.—For making up of private street, for the urban district council.—Mr. Hy. W. Poole, clerk.

SURBITON.—August 1st.—For private street works, for the urban district council.—Mr. F. W. Wood, clerk.

WANSTEAD.—August 1st.—For retopping about 3,600 yds. super. of footway with Derbyshire limestone tar paving, for the urban district council.—Mr. Bruce Blewitt, clerk.

TEDDINGTON.—August 3rd.—For making up certain roads, for the urban district council.—Mr. M. Hainsworth, surveyor.

BOLLINGTON.—August 5th.—For the supply of 300 tons of granite macadam, for the urban district council.—Mr. S. Knight, clerk.

LANCHESTER.—August 6th.—For tar-grouting work, for the rural district council.—Mr. W. Cumming, highway surveyor.

CHINGFORD.—August 6th.—For making-up work, for the urban district council.—Mr. L. C. Bowen, clerk.

SUNBURY-ON-THAMES.—August 6th.—For the supply of granite, for the urban district council.—Mr. H. F. Coales, surveyor.

BUNGAY.—August 8th.—For the supply of Mountsorrel or Quenast granite, for the urban district council.—Mr. P. J. Sprake, clerk.

CHICHESTER.—August 29th.—For making up with granite macadam about 10,000 super. yds. of London-Portsmouth road, for the corporation.—Mr. J. W. Loader Cooper, town clerk.

CASABLANCA.—August 29th.—For the improvement of several roads, for the Special Committee of Public Works.—The President, Comité Special des Travaux Publics, Dar En Niaba.

CASABLANCA.—August 31st.—For the construction of public roads, for the Moroccan Adjudications Commission. Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

SOUTHWELL.—For the supply of non-poisonous dust preventives.—Mr. H. Blewitt, district surveyor, Allerton, Notts.

Sanitary.

HOOLE.—July 27th.—For works of sewage and making up back passages, for the urban district council.—Mr. A. E. Caldecutt, clerk, 17 Newgate-street, Chester.

SELBY.—July 27th.—For the cleansing of open sewers, for the rural district council.—Mr. J. Townend, clerk.

BYSHOTTES.—July 27th.—For laying sanitary pipes and manholes, for the urban district council.—Mr. A. A. Luxmore, 5 North Bailey, Durham.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. AUGUST 2, 1912. No. 1,072.

Minutes of Proceedings.

Sewage Disposal at the Sanitary Congress.

During recent years this subject has played a prominent part at the annual congresses of the Royal Sanitary Institute, which numbers among its members many engineers, surveyors, medical officers of health, and others eminent in their several professions and keenly interested in the modern developments of sewage treatment. It was thus natural that such occasions should be utilised to describe the results obtained by recently introduced new methods, and to make known further developments or new theories. The reports of the Royal Commission on Sewage Disposal alone furnished matter for numbers of papers and many animated discussions, and the opportunities offered at these annual congresses for public and private consideration of the many points which arose, and the numerous problems awaiting solution, undoubtedly assisted, to a large extent, the rapid progress which has been made in recent years. This rate of progress could not, however, continue indefinitely, and the number and character of the papers connected with sewage disposal at the annual congress in York this week are indications of the fact, already recognised in many quarters, that we have at last reached that point where future developments will be mainly concerned with details only of the methods of treatment now in general use, or of modifications necessary to meet the requirements of exceptional conditions.

Of the four papers that have been under consideration, and which we print on another page, the first refers in a very general way to the disposal of sewage in rural districts, and the second revives the controversy of land versus so-called "artificial" methods of treatment. The third describes an interesting process of sludge treatment, and the fourth a somewhat unusual method of extending a sea outfall. There is nothing radically new in any of the papers, but they are none the less interesting. One phrase in Mr. A. Rodwell's paper is extremely important and needs special emphasis, especially in connection with small works in rural districts. Mr. Rodwell prefers a certain simple method of treatment for isolated houses "*if attended to regularly.*" Most engineers will agree with us that *all* methods of treatment need regular attention. The best designed scheme will fail if not properly managed, while an imperfectly designed scheme will often yield excellent results if it is carefully worked. Too many statements have been made in the past as to the automatic action of tanks and filters, and it would tend to prevent many failures in the future if engineers would make it clear to their clients that all works, large and small, require regular and careful attention in order to secure the best results. Another feature of this paper is the number of instances quoted in which the discharge of partially treated, or even untreated, sewage into a river failed to cause any nuisance or serious pollution, excellent evidence of the efficacy of purification by dilution when carried out under suitable conditions.

The paper by Messrs. Hindle and Whitaker, in which they describe the method they adopted at Penrith for dealing with sludge, may be of use in cases where similar conditions exist, but the time required for the wet sludge to dry—six weeks—appears to us to be capable of reduction by the adoption of properly arranged draining beds, and the period of twelve months needed for the sludge to attain its most beneficial condition as manure, after removal from the beds, would prevent the adoption of this system in many cases. The purification of the sewage at Penrith, after preliminary treatment in tanks, is accomplished by irrigation on land, and this scheme might be taken as lending support to the arguments set forth by Mr. Manley in his paper upon "The Advantages of Land over Artificial Schemes." It must, however, be borne in mind that the land at Penrith, as described by the authors in the paper referred to above, is "eminently suitable for filtration purposes, consisting of a deep bed of gravel, which is overlaid with about 2 ft. of fibrous soil." This is the kind of land which the Local Government Board would certainly consider as "suitable" for land treatment, and it is the impossibility of securing land of this character, in most cases, which has necessitated the construction of the "artificial" schemes referred to by Mr. Manley. Indeed, the subsoil at Penrith is simply a natural percolating filter, and all artificially constructed schemes are the means adopted to secure suitable filtration areas in places where nature has not provided them. Mr. Manley considers the old requirement of the Local Government Board for a certain area of land for all sewage disposal works a "very wise precaution," but he does not lay sufficient emphasis upon the word "suitable," and this is exactly the reason why so many schemes sanctioned by the Board in the past failed to produce the required results after a time. The best example of land treatment quoted by the author is that at Aldershot, and the description of the subsoil given in the paper—sand and gravel—shows that it is of a "suitable" character. As 120 acres are under cultivation, and the estimated daily flow is 1,000,000

gallons, the volume of sewage dealt with per acre is only 8,334 gallons, or about $1\frac{3}{4}$ gallons per square yard per day! When it is taken into consideration that about fifty times this quantity per square yard can be satisfactorily treated upon artificial filters properly designed and managed, it will be seen that even if "suitable" land were available everywhere, the very much smaller area required for "artificial" methods may, in many cases, render their adoption desirable, apart from any other considerations. The friends of land treatment will probably point to the case of Dorchester, where, as reported in our issue of last week, the town council have decided to change the present treatment of the sewage to that of broad irrigation, in support of their arguments, but we feel certain that the present-day scientific methods of sewage purification will never be abandoned in favour of the old rule-of-thumb system of treatment on land, irrespective of its character.

* * *

The Utilisation of Road Sweepings.

It has been the custom in the past for gardeners to welcome the offer of road sweepings for their gardens, especially in cases where the soil was of a "heavy" character, but the enormous increase of motor-driven traffic in recent years has given rise to doubts as to whether this material is as suitable as it used to be for the purpose in question. Some may have thought that the oil droppings from motors may even have rendered the road sweepings of to-day actually harmful to garden plants. So far as we are aware it does not seem to have occurred to anyone in this country to investigate the matter in a proper manner, and we have to thank the Government of the U.S.A. for definite information on the subject. We are indebted to our esteemed contemporary the *Engineering Record* for particulars of a report prepared at the instance of the Bureau of Soils of the Department of Agriculture dealing with the value of road dust and sweepings as fertilising material. The material was studied from the point of view of its organic and inorganic constituents, and its effect upon plant life. Different samples were tested, such as those produced by hand sweeping, by machine sweeping, and from a heap which had been accumulating for some time and in which the organic matter was partially decomposed. Hand sweepings showed the greatest content of nitrogen, potash and phosphate, but all three constituents were less than those contained in ordinary horse manure. Experiments as to the effect upon the growth of plants were made with all three samples, and at the same time, for purposes of comparison, with untreated soil, and with soil to which good stable manure had been added. Wheat was grown in these mixtures for 30 days and the plants were then cut and weighed. Compared with the weight of the plants grown in untreated soil, the increases were as follows:—5 per cent in the case of decomposed sweepings, 10 per cent. in the case of machine sweepings, 31 per cent with hand sweepings and 46 per cent with stable manure. It was considered that these results indicate that, while road sweepings are beneficial, they are not so efficient as good stable manure.

In order to ascertain what effect, if any, the lubricating oil in the sweepings had upon plant life, the mineral oil in three similar samples was extracted and found to be as much as 1·7 to 2 per cent. When added to the distilled water mixed with nutrient solution in which young wheat seedlings were growing, it was found to reduce the growth to an extent varying from 10 to 20 per cent. Further experiments were then made with the same samples of sweepings *after* the oil had been extracted, and it was found that the fresh road sweepings were both quite as beneficial as the stable manure, and the decomposed only very slightly less efficient. The authors of this report, Messrs. Skinner and Beattie, have suggested that it might be worth while to consider the possibility of recovering low-grade lubricating oil from road sweepings, more particularly in towns where there is much motor-driven traffic. Whether this will be found to be economically practical or not, it is evident from these experiments that the introduction of motors for propelling road vehicles has considerably reduced the value of road sweepings as a fertilising material, and may even have rendered it deleterious to plant life in places where this type of traffic has largely superseded the use of the horse-drawn vehicle. The investigators who carried out these experiments deserve much credit for the admirable manner in which they dealt with the subject and for the very clear manner in which the results are arranged and explained in their report.

* * *

The Berlin Congress.

In another column will be found a report of the excellent address which was delivered by Mr. P. C. Cowan, M.INST.C.E., in his capacity of president of the Municipal Engineering, Architecture and Town Planning Section of the Congress of the Royal Institute of Public Health held in Berlin at the end of last week. It would be difficult to suggest a more appropriate *venue* for such a congress, inasmuch as the interest which the German people have shown in all matters pertaining to the science of health, and their very substantial contributions to its advancement are generally recognised. Mr. Cowan pointed out the very extensive character of the field which has to be covered by the modern municipal engineer, and proceeded to offer some observations on its more salient features, such as scavenging, water supply, drainage and housing. He laid special emphasis on the paramount importance of an efficient service for the removal of waste products. After all, the modern city is a huge living organism, and if it is to be maintained in a healthy condition full provision must be made for the elimination of noxious waste matters of every kind. This involves the establishment of schemes for the removal and disposal of house refuse, drainage, sewerage, sewage disposal and street cleansing. The term "scavenging," thus interpreted in its widest sense, includes a very large proportion of the matters which come within the ken of the municipal engineer, and from a public health point of view we agree with the opinion expressed by Mr. Cowan that the most important duty of a town authority is scavenging.

Another matter of obvious importance to which Mr. Cowan devoted considerable attention was the question of water supply. A plentiful supply of pure water is nowadays such a common thing that its value is often not appreciated. Consequently, waste is an all too frequent occurrence, and public opinion is only aroused on the rare occasions when an adequate supply fails from drought or some other cause. In dealing with sewers and drains, Mr. Cowan spoke of the opinion which has been expressed in some quarters that the intercepting trap — now commonly placed on the house drain just before it joins the sewer to prevent the passage of air from the sewers into the house drains—may safely be omitted, and ventilation of the sewers, as well as the house drains, permitted through the soil pipes. We agree with his opinion on this point that the intercepting trap can only be safely dispensed with when plumbing, house drainage, and sewer construction have been brought up throughout the country to the standard of the best modern practice, by more scrupulous inspection and testing than are at present usually secured. A very interesting and varied address concluded with some observations on housing, and an expression of confidence in the improvements which may be achieved by the application of the Housing and Town Planning Act.

* * *

The Prevention of Smoke.

The case which was recently decided by a Divisional Court in which the Greenwich Borough Council unsuccessfully proceeded against the London County Council in respect of an alleged

smoke nuisance at the electric power station belonging to the latter body has again drawn attention to a matter of considerable public importance. The excessive emission of black smoke is not only inconvenient, but disagreeable in the extreme. Moreover, when smoke is given off from a fuel there is a loss of carbon monoxide and other combustible gases, indicating imperfect combustion and consequent waste. It took considerable time to educate large fuel consumers to the fact that the greater portion of the smoke going out to pollute the atmosphere was really waste heat, and could be employed to great advantage in their own boilers, but within the last few years there has been a remarkable development in the utilisation of coal under the steam boiler, and to-day many steam plants are burning bituminous coals practically without smoke. This is largely due to improvements in the design of the furnaces and more care on the part of the firemen. In fact, it is now generally realised that coal can be burned practically without smoke if the equipment is properly designed and adjusted. In order to secure this desirable result the coal should be supplied to the furnace in small quantities at frequent intervals. The more nearly the feed approaches a continuous and uniform supply the better the results. Further, the air supply should be slightly in excess of the theoretical amount required, and it should be admitted through the fuel bed, with an auxiliary supply admitted at the front or rear of the furnace to burn gases from the coal. The temperature in the furnace should be sufficiently high to ignite the gases given off from the fuel bed; and there should be a fire-brick combustion chamber of sufficient dimensions and so designed as to cause the thorough mixture of the gases and air, permitting complete combustion before the mixture reaches the boiler surfaces. If these precautions were generally observed the smoke nuisance would be practically non-existent, and the expense of costly legal proceedings would consequently be avoided.

* * *

Town Planning in America.

One of the most remarkable characteristics of the modern town planning movement is the world-wide nature of the activity which it has engendered. In practically every European country and in America the question of a more rational method of town development has been the subject of discussion and conference, in many cases resulting in the evolution of practical schemes. In order to keep abreast of this subject, therefore, it is necessary to watch the progress of events abroad as well as in this country, and we make no apology for referring to the National Conference on City Planning which was recently held at Boston. The problem of the city in America is really very much like that which presents itself for solution here. It consists broadly of two distinct parts—the overcrowded centre and the control of suburban development. The Mayor of Boston in his address to the conference sought to emphasise the practical urgency of the problem, and clearly pointed out that we are working not for the purpose of ventilating our personal opinions, or of sketching vaporous visions of a city beautiful, which is to be brought into being somewhere, somehow, at some future stage of the world's progress, but for the purpose of bettering conditions of life in any existing city, and wherever tens of thousands and hundreds of thousands of men are living under conditions that are admittedly far from ideal. He also called attention to the necessity for cheap transportation if town development is to proceed on modern lines, and acknowledged to the full the part which the municipal engineer ought to play in regard to town planning schemes. There is a notion, all too prevalent still, that city planning is purely a question of landscape architecture, but those who have had to do with the actual work of municipal government, realise that dependence must be placed upon the municipal engineer for the laying out of subways, streets, sewers and water systems, which are in a sense the skeleton over which the great organism of a city is developed.

Sanitary Progress and the Law.

In connection with the Annual Congress of the Royal Sanitary Institute, the usual conference of engineers and surveyors to county and other sanitary authorities took place on Tuesday last. These conferences have proved of great usefulness in the past as providing a medium for the interchange of ideas upon those parts of the duties of a municipal engineer which fall more particularly within the scope of the work of the Sanitary Institute. This year's conference, which was presided over by Mr. A. D. Greatorex, M.INST.C.E., the borough engineer and surveyor of West Bromwich, was no exception to the rule. The presidential address, which will be found *in extenso* in another column, dealt with the more salient features of modern sanitary progress, and contained an appeal which we cordially support for a codification of the Public Health Acts. As we have said in these columns on more than one occasion, the fact that the law is contained in a large number of statutes together with the frequency of legislation by reference, and the enormous number of decided cases which have created a vast body of "judge-made law," render it impossible for any but the expert to understand or indeed to discover what the law is on any desired subject. Surely the time has arrived for the unravelling of all these tangled threads, and for placing on the Statute Book a comprehensive consolidating Act which will in itself embody the whole of the existing law on matters affecting the public health.

* * *

An Anomaly.

The city of Toronto has the unenviable distinction of being probably the largest municipality in the British Empire whose city engineer is not a technical man and has never had any engineering training or experience. This extraordinary position has arisen owing to the appointment as Commissioner of Public Works at Toronto of a gentleman who, although apparently well qualified for the discharge of the duties of this purely administrative office, is certainly not qualified to bear the designation of city engineer, which is for some reason given to him, although the whole of the technical work in connection with the city's administration is in the hands of a qualified gentleman who has to be content with the title of acting city engineer. It seems not only anomalous but actually unfair that the man who carries out the duties and bears the responsibilities which usually attach to the office of city engineer does not possess the title to which he has every right. Nor does it seem other than disadvantageous to the gentleman who has the official title of city engineer, that, so far as the duties of the office are concerned, he must depend entirely upon a subordinate. It can hardly be that such a position makes for efficient administration, which ought to be the only consideration in a matter of this kind.

An Interesting Calendar Competition

In "Minutes" in our issue of June 7th (page 817) appeared an announcement inviting competition for a prize of £10 offered by Messrs. Josiah Smart & Son, of 53 Victoria-street, Westminster, for a suitable design for their next year's calendar. A fair response was received, and the designs have been duly adjudicated upon by the three judges—Mr. H. Percy Boulnois, M.INST.C.E., Mr. C. Spurrier Mason, of THE SURVEYOR, and the Editor of that journal. As a result there was no difficulty in unanimously placing first the design sent in by Mr. F. C. E. Gradicky, of Manchester, who therefore receives Messrs. Smart's award.

Municipal Engineering, Architecture and Town Planning.

By P. C. COWAN, D.Sc., M.Inst.C.E., Chief Engineer to the Local Government Board for Ireland.

[At the Congress of the Royal Institute of Public Health, held in Berlin at the end of last week, Mr. Cowan delivered the following address as president of the Municipal Engineering, Architecture, and Town Planning Section.]

My first duty is to express my high appreciation of the honour of being president of this important section of a memorable congress, held under the most favourable auspices in this Imperial city. The invitation extended to the Royal Institute of Public Health to hold a session in Berlin was most gladly received and accepted, and our best thanks are due to the high officials and distinguished scientists who have planned the arrangements for our edification and pleasure which are set out in the programme of the congress.

I think I voice your thoughts when I say that we come to this great centre of national activity with the minds of inquirers and students, and with little inclination to pose as teachers, though we hope that the present occasion of sympathetic intercourse with a highly esteemed and kindred people may be to some extent of mutual benefit. In thinking of Germany, our minds are impressed by the high character, courage, efficiency, and discipline which have placed this country in the forefront of civilisation and compelled the admiration of the world.

King Frederick William, after the battle of Jena, said: "Germany must regain by intellectual power what she has lost in material power. For this purpose it is my desire that everything possible may be done to extend and perfect the education of the people." With such a national ideal, it is not to be wondered at that, after the storms and stress of a century, the German race is strong on land and sea, and that, throughout the wide Fatherland, under a succession of wise rulers, science and the arts have been cultivated and applied for the common weal to a degree which has never been surpassed.

I cannot resist the temptation to quote, in this connection, from a speech made by the late Prince Consort Albert when the preliminary arrangements for the First International Exhibition of 1851 were being made, as it indicates the fine product of German education, and sums up the ideal purposes of international congresses. He said:—

"I conceive it to be the duty of every educated person closely to watch and study the time in which he lives, and, as far as in him lies, to add his humble mite of individual exertion to further the accomplishment of what he believes Providence to have ordained. Nobody who has paid any attention to the particular features of our present era will doubt for a moment that we are living at a period of most wonderful transition which tends rapidly to the accomplishment of that great end to which, indeed, all history points—the realisation of the unity of mankind—not a unity which breaks down the limits and levels the peculiar characteristics of the different nations of the earth, but rather a unity the result and product of those very national varieties and antagonistic qualities. The distances which formerly separated the different nations and parts of the globe are gradually vanishing before the achievements of modern invention, and we can traverse them with incredible ease; the languages of all nations are known, and their requirements placed within the reach of everybody. On the other hand, the great principle of division of labour, which may be called the moving power of civilisation, is being extended to all branches of science, industry, and art. While formerly the greatest mental energies strove at universal knowledge, and that knowledge was confined to the few, now they are directed to specialities, and in these again to the minutest points; but the knowledge acquired becomes at once the property of the community at large. Science discovers the laws of power, motion, and transformation; industry applies them to the raw matter which the earth yields us in abundance; art teaches us the immutable laws of beauty and symmetry, and gives to our productions forms in accordance with them."

The Prince ended his speech, which, after nearly three-quarters of a century seems full of wisdom and hopeful suggestion fitted for the present day, with an aspiration that the exhibition would evoke feelings "of deep thankfulness to the Almighty for the blessings bestowed on us already here below," and lead to "the conviction that they can only be realised in proportion to the help which we are prepared to render to each other, by peace, love, and ready assistance, not only between individuals, but between the nations of the earth."

Our section includes the great subjects of municipal engineering, architecture, and town planning, each of which affords an unbounded scope for study. You will, therefore, readily agree with me that in the short period for which I have the honour to address you I can only deal in a light and general way with a few points which appear to be of special interest, and that I must be careful not to detain you long from the consideration of the carefully prepared papers on individual subjects with which we have been favoured by the authors.

MUNICIPAL ENGINEERING.

Municipal engineering is a wide term, only slightly less extensive than the word engineering. The conditions of life in our modern cities and towns require the application of engineering ability in almost countless directions. Evidently engineering of a systematic kind was first called into being when men ceased to be nomadic, and planted their homes together on some carefully chosen spot convenient for the supply of water and food, and easy of defence. Since those remote days an immense development of engineering, architecture, and town planning has taken place, with results which are magnificently manifested in Berlin and other German cities. There is, however, much to be done before the conditions of life in town and country can be deemed satisfactory, and there are many unsolved problems in sanitary and social work to which our energies should be unceasingly directed in fulfilment of the paramount law—the welfare of the people.

Hippocrates, the most celebrated physician of antiquity, more than 2,000 years ago, gave as the cardinal hygienic formula—"Pure air, pure water, and a pure soil"; and after all these centuries we know nothing to add to it as a working rule for the sanitarian. In their various spheres, embracing the provision and maintenance of ways and means of transit, the orderly and convenient disposition of healthy houses, the supply of water, and the removal and destruction of waste matters, the true function of the engineer and architect is to fulfil the ancient prescription in as dignified and economical a manner as possible, and in all cases with the beauty of fitness.

SCAVENGING.

The most important duty of a town authority, in my opinion, is scavenging. This idea was enunciated many years ago, but is still insufficiently regarded. Nothing is of greater benefit to the health of a community than the systematic and speedy removal of all waste organic matters from the vicinity of dwellings. In no other direction can the expenditure of skill, energy and money be more profitably directed than in perfecting the arrangements for public and domestic scavenging to get rid of foul liquids, solids and dust from streets and houses. The importance of this part of municipal engineering has been emphasised by the science of bacteriology, and comparatively lately by the recognition of the potency of flies as carriers of infection. The public authorities in Germany are to be congratulated on their adoption over wide areas for many years of asphaltic roadways, which are smooth, impervious and admirably adapted for perfect scavenging, and, moreover, ideal for motor traffic. The importance of the dust nuisance on roads and streets was always great, but it has been accentuated by the revolution in means of locomotion which has taken place in recent years, and the attention of engineers is now earnestly directed to its abatement. This can be best secured in towns by the adoption of smooth pavement, as free from joints as possible, and by thorough cleansing with the aid of water. When, for local reasons, the roadways cannot be sluiced with water, they should at least be sprinkled before being swept. Unless this is done, much of the dust is disturbed and scattered without complete removal.

Dry sweeping of streets, as well as dry sweeping and dusting in houses, should be abandoned as far as possible, as it is often worse than useless.

WATER SUPPLY.

The supply of good water in ample quantity and in a convenient manner is one of the most important tasks of the municipal engineer. The value of such a supply is not sufficiently appreciated by most people, and only strikes them on the rare occasions when it is cut off. Until comparatively recently, carelessness with regard to the quality of the water supplied to towns, and as to its exposure to contamination after delivery to the consumers, was very general, and even to-day it largely prevails. In America large quantities of water are distributed in a very liberal manner, but sufficient care is not always taken with respect to its purity. In the British islands the supply of water for domestic purposes, though more limited, is not charged for according to the quantity used, as is the case in Berlin, and, as a consequence, in many towns there is great waste, which throws an unnecessary burden on the community. Evidently a moderate supply of good quality is much more valuable than a large supply of doubtful purity, but it is exceedingly difficult to get some town authorities to be sufficiently energetic in the prevention of waste, though ample powers in this respect have been afforded to them by the general statutes and by by-laws made under them.

TYPHOID FEVER.

The incidence of typhoid fever, more than that of any other disease, is a test of sanitary conditions, and experience throughout the world has demonstrated that in many cases the provision of a pure water supply has reduced the mortality from this terrible scourge by 75 per cent. In the British islands, catchment areas for water supply, varying in extent from 10 to 70 square miles, have been purchased by the corporations of twelve cities for the purpose of preventing any risk of pollution. In Berlin, Copenhagen, Edinburgh, Hamburg, London, Paris and Rotterdam, which are supplied with carefully filtered water, the average death-rate in recent years from typhoid has been less than 10 per 100,000, which shows that in these great cities water-borne typhoid has been practically eliminated. To eradicate the disease completely—and this is confidently hoped for—it is to other causes that our attention must now be turned, bearing in mind that typhoid is a filth disease, and is frequently carried by milk and other foods that have been in contact with "carriers," convalescents, or sufferers.

Lecturing on this subject a quarter of a century ago, the late Prof. Fleeming Jenkin said a prosecution ought to be instituted with respect to each case of typhoid fever, and this statement can scarcely be gainsaid when the terrible nature of the disease and the fact that it is the typical preventable disease are considered. Prof. Sedgwick says: "Every case of typhoid fever comes from somebody's ignorance or neglect."

Mr. Whipple, an American consulting engineer, who has made a special study of this disease, says: "Not long ago an action was brought against a Western city to recover damages because of the death of a person from typhoid fever, caused, it was alleged, by the infection of the public water supply. The suit was lost. There are some who believe, however, that the time will come when such suits will not be lost, when the public authorities will be held legally as well as morally responsible for deaths due to infected water."

The Public Health Acts in force in England and Ireland definitely provide that "a sanitary authority shall provide and keep in any waterworks constructed or purchased by them a supply of pure and wholesome water," and also afford a way of compelling a defaulting authority to perform its duty.

Despite these and other excellent provisions in the Public Health Acts, progress in sanitary improvements in Great Britain has been disappointingly slow and ineffective, as many authorities insufficiently recognise that liberal expenditure for the improvement of the health of the people is usually profitable in every sense, though much of the profit is yielded indirectly. It is not, therefore, remarkable that in the National Insurance Act, which is to some extent modelled on the corresponding legislation in Germany, and which comes into operation this year throughout the British islands, a new and drastic provision is made by which a sanitary authority is made liable for compensating in money any loss falling upon an insurance society on account of excessive sickness due to the failure of the sanitary authority to exercise its remedial powers under the Public Health and Sanitary Acts.

WATER FILTRATION.

The application of mechanical filters for the purification of water is common in America, and is extending in Great Britain, but recent careful investigations in England and Scotland show that their suitability in special cases can only be judged by very careful chemical and bacteriological tests. The old-fashioned gravity sand filter is still most generally used, though it is, in some important ways, a defective arrangement, requiring, as Koch and other distinguished experts have pointed out, scientific skill and attention to secure uniformly good results. The most promising recent development is the arrangement of filter-beds in a series, in which the water passes successively through coarse, medium and fine materials, separately contained in the different filters. With this arrangement, the inevitable disturbance of the quality of the filtrate due to the cleaning of the filters is considerably postponed with great advantage, and the filters can be allowed to ripen before being used after cleaning without serious inconvenience. The classical work of Dr. Houston, Director of Water Examination, Metropolitan Water Board, London, has recently made great additions to our knowledge of questions affecting the purity of water, and has demonstrated the great value of prolonged storage. In other quarters, especially in France and Germany, considerable advances have been made in this field, with relation to the sterilisation of water by ozone and chlorine, and by ultra-violet rays from electric lamps. The last-named method is inexpensive, as the consumption of electricity is small, and it appears to be specially suitable for the treatment of waters which are free from turbidity. With turbid waters, it could probably be used with great advantage after preliminary sedimentation or mechanical filtration. The most important point to note is that all methods of water purification require, and are worthy of, constant expert supervision.

SEWERS AND DRAINS.

The water carriage system for the removal of foul wastes from buildings is now almost universally adopted, and is undoubtedly the most sanitary and economical. Until about thirty years ago little care was taken to prevent the passage of foul air into houses from the drains and sewers, and though, perhaps, having regard to recent knowledge, the early estimates of the evil effects of such air were exaggerated, it is clearly of great importance to exclude it from houses. Great improvements in sanitary fittings and in house plumbing and drainage have been secured in recent years, but they have not yet been generally applied, and the subject is worthy of the most scrupulous attention. In the best British practice, heavy iron pipes are now used for house drains, and the whole work is thoroughly tested by means of an air pump and pressure gauge. Increased care is being given to the construction of sewers to ensure that they shall be quite impervious, smooth, rapid in delivery, convenient of access for inspection, and properly ventilated. The British Public Health Acts require that, "Every sanitary authority shall cause the sewers belonging to them to be constructed, covered, ventilated, and kept so as not to be a nuisance or injurious to health." The improvements secured in house drainage and town sewerage have been so great during the last thirty years that it is considered by many authorities that the intercepting trap—now commonly placed on the house drain just before it joins the sewer to prevent the passage of air from the sewers into the house drains—may safely be omitted, and ventilation of the sewers, as well as the house drains, permitted through the soil pipes. My opinion on this point is that the intercepting trap can only be safely dispensed with when plumbing, house drainage, and sewer construction have been levelled up throughout the country to the standard of the best modern practice, by more scrupulous inspection and testing than are at present usually secured.

The great subjects of sewage disposal and the prevention of the pollution of rivers still present many unsettled questions, but the general situation has been greatly eased by the interim reports of the Royal Commission on Sewage Disposal, which, though appointed in 1898, has not yet concluded its labours. The problems involved are, however, still difficult, and call for the exercise of much professional skill in the selection of suitable methods according to local circumstances. I am very glad that a paper on this sub-

ject by one of the honorary secretaries of this section, who is specially qualified to deal with it, will be presented to you. I would also take this opportunity of expressing the high appreciation of British engineers of the valuable research and practical work done in this sphere by Dr. Dunbar, of Hamburg, and other German scientists.

In Berlin the community has the good fortune to have available large areas of land suitable for the treatment of sewage, and the sewage farms of this city have an area of nearly 70 square miles, and are managed with great energy and efficiency. Mr. Albert Roechling, M.INST.C.E., in a recent exhaustive account of this system, states that, apart from capital charges, there is a profit on the working of the farms of about 11s. per 1,000,000 gallons of sewage, but that, taking capital charges into account, the nett cost of the purification of the sewage is about £6 per 1,000,000 gallons.

LIGHTING.

The questions of lighting and means of transport are so important for the health and convenience of the people, and especially for town dwellers—who in England and Wales constitute 78 per cent of the total population—that for a moment I venture to refer to them. In the realm of the lighting engineer rapid progress continues to be made, and the keen rivalry between the electrical engineer and the gas engineer has been productive of much benefit to the public. Prosperity still attends most well-managed gasworks, though the sale price of gas has fallen greatly. From one very successful works at Widnes, in Lancashire, gas is supplied at less than 1s. per 1 000 cub. ft. In different parts of London and other large cities the streets are equally well lighted by gas and electricity, and at approximately the same cost. It should be noted that the principal means for this beneficent contest, the metallic filament lamp, and the incandescent mantle, were given to the world by Germany.

TRANSPORT.

The advent of the internal combustion engine has brought about another contest in efficiency and economy, which is greatly affecting the transit question. Railway and tramway companies are now being pressed by the competition of motor vehicles, and this is immensely to the advantage of the working classes, by freeing them to a large extent from the necessity of living in congested centres. Trackless trolley systems have not yet made any headway in the British Islands, mainly on account of the question of road maintenance, and rapid progress in this direction is unlikely, as motor-buses can now be run at an inclusive cost of less than 6d. per mile.

HOUSING.

One of the greatest problems for the sanitarian is the proper housing of the working classes. An initial difficulty is the high cost of a good house of even minimum dimensions, compared with the rent which the poorer working man can afford to pay. Until recent years, block buildings were in favour in the British Islands among pioneers of housing reform, but the modern view is quite opposed to their erection. They are costly to build and to maintain, and do not satisfy the people, who wisely prefer to live where they and their children can readily step from the house into the open air. The average weekly rent per room in the houses of the working classes has been recently authoritatively stated as follows:—

In the United States of America, 2s. 6d.; in Germany, 2s.; and in England, 1s. 6d.

Alderman Thompson, of Richmond, says: "It must be acknowledged that the subsistence wage of the unskilled worker is not sufficient to allow him to pay the mere interest on the bricks and mortar which form his dwelling. Under present circumstances, it is almost impossible to house the very poor in really healthy houses so as to make a commercial profit. The raising of the standard of building, and the enforcement of structural sanitation by Model By-laws have, while making the houses more habitable, added considerably to overcrowding, and every act of the sanitary reformer will make the problem of housing the very poor more acute."

With the aid of cheap Government loans, 1s. rent per room will meet all charges when the total cost of the house does not exceed £10 per room. Many cottage schemes have been carried out at about this figure, but in block or tenement houses erected by the town authorities the cost per room is, on an average, more than £50 per room.

An interesting experiment was made some years ago by the city engineer of Liverpool in the construction of houses for the working classes with very large concrete slabs, one of which formed a complete wall or floor of a room, but the experiment was not economically successful, on account, no doubt, to some extent, of its limited scale. Further effort in this direction appears to be very desirable, especially as by reinforcement of the concrete the necessary strength in the floors and walls could be secured with a great reduction in mass.

There are a few rays of hope which lighten the dark problem of the housing of the working classes. The progress made in the garden cities and town planning movements must gladden the hearts of the pioneers, who, overcoming almost insurmountable difficulties, have at last convinced the workaday world. The Housing and Town Planning Act of 1909 is one of the most far-reaching and beneficent of the numerous statutes enacted for the improvement of social conditions in Great Britain. It fulfils the aspirations long cherished by many disinterested and clear-minded philanthropists, and in some large schemes in England, notably that in Sheffield, the difficulties in applying the Act, which were prophesied as insurmountable by the few remaining supporters of the doctrine of *laissez faire*, have been overcome with ease. We are fortunate in having before us a valuable paper on this subject by Mr. Thomas Adams, of the English Local Government Board, who is especially connected with the operations under the new Act. Another excellent new movement, "Co-Partnership in Housing," is now well established in England, and I heartily commend the lines of its work to the study of all who are interested in the question. This system happily combines the benefits of wholesale dealing and management with elements which foster self-reliance and secure the active individual co-operation of the members of the society in maintaining the houses and their surroundings in good order. Some of its cardinal merits are that it is economically sound, and practically independent of State or municipal aid, that it fosters and develops manly qualities and good citizenship, that it is suited for large or small areas, and can be adapted and expanded according to local requirements.

In conclusion, gentlemen, I congratulate you on the good fortune which has brought us to Berlin, where there is so much to learn from the results of that public spirit and high sense of duty which are so marked a feature of German civic life.

SEWAGE DISPOSAL AT WEST BRIDGFORD.

OPENING OF NEW WORKS.

A new system of sewage treatment at West Bridgford was inaugurated on Wednesday of last week, and it is believed that the problem which everywhere is becoming increasingly difficult has been solved by the progressive Nottingham suburb for at least the next ten years.

For the past fourteen years the contact system has been in operation at West Bridgford; now, when the necessity has arisen for extending the capacity of the plant, the percolating system has been adopted. The contents of the sewers are pumped into septic tanks and thence passed by travelling sprinklers over clinker beds.

The sprinklers, which are of the rectangular type, and which were supplied by the Ames-Crosta Sanitary Engineering Company, Limited, 12 Victoria-street, Nottingham, are, as is well known, absolutely automatic in their action, working day and night without any attention.

The works are now designed to treat nearly 1,000,000 gallons per day, which is three times the dry-weather flow of the parish, and they occupy only 3 acres of land, though the council possess about 18½ acres, which is used for the disposal of dry refuse, and so forth.

The formality of setting into motion the new plant (which has cost about £4,000) was performed by Mr. G. T. Lovell, the chairman of the Sewage Farm Committee. At a luncheon which followed, the surveyor to the council, Mr. W. Pare, to whom much of the credit for the successful carrying out of the scheme is due, was the subject of complimentary reference.

The "Ex-Pupils' and Assistants' Column." "L. V." writes: I must ask you to withdraw my advertisement from your "Ex-Pupils' and Assistants' Column," as it has been the means of my obtaining a good appointment under the — corporation as assistant surveyor. I had five answers in all—a testimony to the value of the column.

Royal Sanitary Institute.

ANNUAL CONGRESS AND EXHIBITION AT YORK.

In addition to many foreign and colonial Governments and home Government departments, county, town and district councils, universities, and various professional societies, to the number of some 500, are represented at the twenty-seventh annual congress of the Royal Sanitary Institute, which opened on Monday at York. The proceedings commenced at the Mansion House, where a reception, which was largely attended, was held by the Lord Mayor (Alderman Norman Green), the presidential address being delivered in the evening at the Festival Concert Rooms by the Archbishop of York. Among the bodies who sent delegates, or whose officials were present at the congress, were the following: Arbroath (Mr. P. C. Smith, burgh surveyor), Banbury Rural District Council (Mr. H. Gander, surveyor), Barrow-in-Furness (Mr. Alderman John Charles, J.P., chairman, Health Committee), Bath Rural District Council (Mr. F. W. Kelway, surveyor), Battersea (Mr. T. W. A. Hayward, borough engineer), Beeston Urban District Council (Mr. J. Roger Anderson, J.P., chairman), Belfast (Mr. J. Munce, M.INST.C.E.), Berwick-upon-Tweed (Mr. Robert Dickinson, borough surveyor), Bingley Urban District Council (Mr. Hiram Bottomley, surveyor), Birmingham, Tame and Rea District Drainage Board (Mr. John D. Watson, M.INST.C.E., engineer to the board), Carnarvon (Mr. Edward Hall, borough surveyor), Cottingham Urban District Council (Mr. J. H. Hanson, surveyor), Devon County Education Committee (Mr. P. Morris, A.R.I.B.A., architect to the committee), Evesham (Mr. H. S. Harvey, borough surveyor), Exeter (Mr. T. Moulding, M.INST.C.E., city engineer), Farnham Urban District Council (Mr. R. W. Cass, surveyor), Grimsby (Mr. H. Gilbert Whyatt, ASSOC.M.INST.C.E., borough surveyor), Halifax (Mr. J. Lord, M.INST.C.E., borough engineer), Harrogate (Mr. C. E. Rivers, ASSOC.M.INST.C.E., borough engineer), Heckmondwike Urban District Council (Mr. J. Saville, surveyor), Hereford (Mr. J. Parker, ASSOC.M.INST.C.E., city surveyor), Hipperholme Urban District Council (Mr. G. Wharton Thompson, surveyor), Institute of Sanitary Engineers (Mr. A. J. Martin, M.INST.C.E., and Mr. E. R. Palmer), Institution of Civil Engineers of Ireland (Mr. P. C. Cowan, M.INST.C.E., president, and Mr. W. Kaye-Parry, F.R.I.B.A., M.INST.C.E.), Institution of Municipal Engineers (Mr. Henry C. Adams, ASSOC.M.INST.C.E.), Institution of Municipal and County Engineers (Mr. A. D. Greatorex, M.INST.C.E., and Mr. J. Walker Smith, M.INST.C.E.), Institution of Water Engineers (Mr. W. H. Humphreys), Leicester (Mr. E. G. Mawbey, M.INST.C.E., borough engineer), Malton Urban District Council (Mr. W. A. Jackson, surveyor), Meltham Urban District Council (Mr. F. W. Littlewood, surveyor), Middlesbrough (Mr. S. E. Burgess, M.INST.C.E., borough engineer), Mirfield Urban District Council (Mr. Edwin Gill, surveyor), Richmond (Yorks) (Mr. H. W. Marsden, surveyor), Royal Institute of British Architects (Mr. Edwin T. Hall, F.R.I.B.A., and Mr. John Slater, F.R.I.B.A.), Royal Institute of Architects of Ireland (Mr. A. E. Murray, R.H.A., F.R.I.B.A., president), Skipton Rural District Council (Mr. Ascough Rodwell, surveyor), Society of Architects (Mr. W. S. Braithwaite and Mr. F. T. Penty), Society of Engineers (Prof. Henry Adams, M.INST.C.E., Mr. E. J. Silcock, M.INST.C.E., and Mr. C. T. Walrond, ASSOC.M.INST.C.E.), Sunderland (Mr. J. W. Moncur, M.INST.C.E., borough engineer), Surveyors' Institution (Mr. Frank Gott, Mr. E. S. Cox and Mr. F. Massie), Wallsend (Mr. George Hollings, borough surveyor). Mr. F. W. Spurr, the city engineer, who has rendered very considerable assistance in connection with the local arrangements for the congress, was among the many representatives of York present, and among the Colonial delegates was Mr. T. W. Stainthorpe, ASSOC.M.INST.C.E. (South Africa).

Following the reception at the Mansion House, an adjournment was made to the Guildhall, where a public luncheon took place, the Lord Mayor presiding. In the course of the proceedings the toast of "The Royal Sanitary Institute was proposed by the Archbishop of York, who said he regarded it as a privilege to welcome to that illustrious city men and women who represented one of the greatest social movements in the history of the past fifty years. In the absence of the chairman of the council (Mr. H. Percy Boulnois) who it was explained had an important engagement in London, Dr. Louis Parkes (vice-chairman) responded to the toast. Replying subsequently to the toast of "The Lord Mayor and Corporation of the City of York," proposed by Colonel J. Lane Notter, treasurer of the institute, the Lord Mayor said that, personally, he regarded the members of the congress as the harbingers of a brighter existence, as apostles of a policy of brighter things and a better side of living.

PRESIDENTIAL ADDRESS.

In his inaugural address to the congress the Archbishop of York remarked that sanitary progress had halved the death-rate and doubled the average duration of life. He would like some people to remember that when they complained, as they did, that while the death-rate was decreasing every other rate had gone up—(laughter)—they could not save 6,000 lives in twenty years and double the average duration of life without being willing to pay for the benefits. The point to be considered about rates was not how high they were, but what service for the individual and for the community they were procuring. It was well to remember that it was difficult to exaggerate the saving of life and suffering which had been brought about by sanitary progress. It would be idle to deny that there was much still to be done in the way of sanitary reform. Hitherto they had been occupied with the prevention of disease; now they must strive more earnestly towards the goal of the development of life, or, in other words, they were passing from the negative to the positive stage of sanitary progress, in which they must strive not only to eliminate preventable causes of disease from the environment of the people, but to fill that environment with the resources of healthy life. In particular, there was need of advance in regard to the all-important question of the housing of the people. It was not enough to destroy slums; they needed great vigilance to prevent the creation of slums in the future. The centre of the problem now was not so much the old cities and towns as the new industrial areas. There already they had received a sufficient legacy of evils in the last fifty years. They had seen under the pressure of population houses, villages, towns built haphazard; the houses erected, the streets filled up before any adequate provision had been made either for sewage or the supply of water, and in which the streets had been laid out without any plan or purpose. Now they had the advantage of experience; they had the discoveries of sanitary science, and they had the benefits of legislation, and the recent Act of 1909 placed the coping stone upon the long series of Public Health Acts. Therefore they had none of the excuses which their forefathers could plead. They might well say that they acted sometimes in ignorance, sometimes because they had no adequate powers, but in their own present case all these excuses failed. If they sinned they were sinning against the light for the future. Let it be understood that bad housing was not a fault or a misfortune. It was a crime. And when they used the strong term crime they meant that the responsibilities must rest upon those who purported to carry them, and they would rest primarily not upon the builders, who were only asked to do as quickly as possible what had to be done, but upon the local public authorities and the public opinion which stood behind them.

CONFERENCE OF ENGINEERS AND SURVEYORS.

The conference of engineers and surveyors to county and other sanitary authorities which, as usual, was held in connection with the congress, took place on Tuesday morning, the meeting place being the Exhibition Buildings. Mr. A. D. Greatorex, M.INST.C.E., borough engineer and surveyor, West Bromwich, was the president of the conference, and delivered the following

PRESIDENTIAL ADDRESS.

I appreciate very much the honour of being called upon to preside over this meeting; at the same time it

is with some diffidence that I endeavour to address you, knowing as I do well the attainments, both practical and scientific, of the modern municipal engineer and surveyor. I am none the less reluctant to undertake so onerous a duty as to address an audience of engineers, every one of whom is an expert in the science of sanitation and therefore quite conversant with every-day sanitary practice and knowledge. My reluctance is not materially reduced when I contemplate that practically every subject pertaining to the daily routine of municipal engineering has been so thoroughly considered and so ably discussed that I found a difficulty in discovering a subject of novelty and interest sufficient to engage your attention for a brief period this morning. We might, however, with advantage review the position and character of sanitary science and practice in the light of present-day experience, and see if we could extract any useful lesson which would assist us to solve some of the many problems in sanitary knowledge still awaiting solution.

Nearly all great changes are brought about by one of two causes, revolution or evolution, be they physical, political, social, or economical, and the change in sanitary practice is no exception to that well-known law. Improvement in health is a personal matter to each of us, for we have all a keen interest in living as long as we can. But life, unless accompanied by health and vigour, would be a burden rather than a blessing. Moreover, this conservation of health and vigour is now, and will be still more so in the future, in our hands; therefore a responsibility is placed upon us of no mean dimensions, and I think you will agree that it is to our interests to demonstrate our knowledge and skill in the science and practice of our profession, so that the public repose confidence in us and trust us to provide for them immunity from the many dangers and diseases incidental to our social and industrial conditions. To appreciate to some extent the advance in sanitary science and practice we enjoy, beyond that ever dreamed of by our ancestors, it is desirable to compare the past with the present, and to deduce therefrom in what direction we may hope and expect improvements and reform in sanitary science and practice in the near future.

IMPROVEMENTS IN SANITATION.

The process of evolution from the open drain to the socketed, highly-glazed, non-porous, water tested, disconnected, and ventilated drain of the cottage to-day is little short of a revolution. Vast as the improvements have been, we are still far from perfection in this particular branch of our profession. In the matter of sanitary conveniences the evolution from the pail to the fully developed, modern pedestal water-closet in extent and magnitude amounts to a revolution, but the changes have been, if slow, the surer and safer process of evolution. Perfection, however, in this appliance has not yet been attained, and greater changes will be called for in the not far-off future. In the matter of sanitary appliances, the later tendency has been in the direction of simplicity and cleanliness, the florid designs and decorations upon which have given place to the severely plain and simple, they being more easily kept clean, and therefore free from the baneful attacks of malevolent microbes, which, according to our scientific teachers, exist in millions in the very dust resting thereon.

The domestic bath is now considered essential to all self-respecting citizens; even so late as the middle of the nineteenth century, fixed domestic baths were a rarity in the residences of the aristocracy, and in the houses of the peasantry were unknown. That evolution has influenced the character and scope of domestic baths is patent to all of us, and you can readily appreciate the extent to which the use of the bath is now utilised. This, however, has been mainly influenced by the facilities to easily obtain a plentiful supply of hot and cold water, and the introduction of a constant water service has made the bath both popular and beneficial.

POLLUTION OF RIVERS.

It is many hundreds of years since our ancestors began to turn their domestic refuse into the flowing rivers. That the baneful practice is still in operation we have ample evidence in the present filthy condition of the rivers passing through many of the important towns in this country. A generation has gone by since the force of public opinion was directed to the danger of public health by the pollution of rivers and watercourses of this country, and Parliament in its wisdom made it unlawful to so dispose of either animal or vegetable refuse. This law is still most flagrantly evaded. How it is evaded we will not stop to inquire. The Rivers Pollution Prevention Act, 1876, prohibits the passage of sewage into streams, and enacts that it shall be an offence to continue the pollution. The pollution of rivers is now mainly due to manufacturing refuse, which can be, to a very great extent, avoided by previous treatment of the refuse without involving an unreasonable cost to those who cause the pollution. As regards the standard of purity to be attained before discharging a liquid into a river, it is difficult to arrive at an agreement that will apply fairly to all rivers.

A distinct advance was made by the passing of the Local Government Act of 1888, which gives county councils power to enforce the Rivers Pollution Prevention Act, 1876, and which enables the Local Government Board to issue Provisional Orders to form joint committees representing interests affected, and investing them with the powers of the Rivers Pollution Prevention Act, 1876, to deal with any river or part of it. Under the powers conferred by sec. 14 of the Act of 1888, the Mersey and Irwell Joint Committee was constituted in 1891, and a similar board was formed for the whole of the rivers in the West Riding of Yorkshire. In 1893 an important amendment was enacted in explanation of sec. 3 of the Rivers Pollution Prevention Act. The Mersey and Irwell Joint Committee obtained an Act in 1892, which gave them a simpler form of procedure than under the Act of 1876, and conferred on them the power to fix a specific time within which sewage disposal works should be undertaken. In 1894 the Conservancy Board for the West Riding of Yorkshire obtained an almost similar Act.

This legislation indicates the course that can be adopted in other places with a view to speedily cure the long-felt evils of the pollution of streams and rivers, not only by sewage, but by manufacturing refuse, the admission of which in an unpurified state into rivers often greatly increases the difficulty of dealing with sewage at outfall works. Some towns compel manufacturers to treat their waste water before it leaves their works, and this should become more the rule. No efforts should be relaxed to prevent the streams from being employed as vehicles for carrying off sewage or manufacturing refuse, and a high standard of purity should be maintained, both from a sanitary and æsthetic point of view.

SEWAGE DISPOSAL.

The researches of science demonstrate that sewage can be made practically innocuous, and until it fulfils this condition it should be prohibited from being put into any river or public watercourse, and any infringement of the law in this respect should be strongly dealt with. The importance attaching to the efficient disposal of sewage cannot be over-estimated, and its suitable treatment has played for many years an all-important part in public health matters. To trace the history and developments that have taken place in this subject would occupy too much of your time to-day, but I cannot leave the subject without briefly referring to the many important changes that have taken place in the last quarter of a century.

The early attempts of dealing with water-carried sewage were in the direction of sewage farms and land irrigation. Then followed purification by precipitation with the aid of various chemicals and other processes too numerous to mention. The sludge derived from chemical precipitation processes used to be regarded as a source of wealth, and much attention was bestowed on the subject by those who hoped to obtain the theoretical value of the fertilising ingredients contained in it; but these anticipations have not been realised. The practical conclusion is that sludge has no recognised value to justify its being regarded other than as a product to be got rid of in the simplest and cheapest way. No doubt in time science will establish a better and simpler way of dealing with this troublesome question. The biological treatment of sewage in properly constructed bacteria beds has been a triumph of latter-day science; but he would be a bold man who declared we had reached in this respect the pinnacle of perfection.

If a town is situated close to the sea it is sometimes considered to be in a more advantageous position than inland towns respecting the disposal of sewage, as it only has to be discharged into the sea. That is not a safe assumption, as the experience of many watering places proves; and I am of opinion that in time it will be found not only an advantage, but a necessity, for the sewage of many of our seaside towns being dealt with inland, and only the effluent being discharged into the sea.

SANITARY LAWS.

In the early days of our history the sanitary laws were very few, and did not provide for the scattered population of the country. As civilisation advanced and populations increased it became necessary that special legislation should be resorted to for the supply of greater powers for improving the external conditions of towns, and otherwise, for the public good, but no general measure was provided for the public until the year 1845. In 1848 a Public Health Act was passed, the important provision of which was the establishment of the General Board of Health. Experience showed that this Act required amendment, and the Local Government Act was passed in 1858. This Act enlarged the powers conferred by the 1848 Act, but was further amended by the Amendment Act of 1861. In 1866 a sanitary Act was passed to amend and improve the law relating to public health. In 1868, two years later, a further Act was passed, which made further extensions of the powers contained in the earlier Act, and this was followed in 1869 by the Sanitary Loans Act, the Sanitary Act of 1870, and the Amendment Act of 1874. In 1875 the Public Health Act was passed, and this can justly be considered the magna charta of our health, and to those who brought it about our best thanks are due. The main purpose of the Act of 1872 was the reorganisation of the local authorities, and it did not attempt to codify or consolidate the law relating to public health; this was accomplished by the Act of 1875.

The Act of 1875 was a complete code of the existing sanitary law of England, and is so well known to you that it is unnecessary to describe it here in detail. Since its passing, however, the law relating to sanitation has been considerably extended and modified. Has not the time arrived when a new and thoroughly up-to-date public health Act should be placed on the statute book in place of the many and various Acts and amendments?

Much has been done in the past through the agencies of the powers conferred by the various Acts of Parliament referred to, the energy and ability of the *personnel* of the various councils who consider them, and the officials upon whom devolves the duty of administering them. Still much remains to be done if the homes of the people of this country are to be brighter, disease swept away, and prosperity to become the keynote of the nation.

MUNICIPAL ENGINEERS' DUTIES.

At the first conference of engineers and surveyors, held in 1892, Mr. H. Percy Boulnois, who presided, exhibited a diagram of the six principal branches of municipal engineering, divided into the various sub-branches, under which the work of a municipal engineer is carried out. Since then, consider what changes and advances have been made in many of the branches of engineering, and the great and varied duties placed upon that official by Acts and other regulations. Has the same advancement been made as regards his status and official recognition by not only the local authorities, but the public whom he serves? In the majority of cases they have not, nor will they, until the public eliminate party politics from municipal affairs, and pay less attention to the man in the street, who does not and cannot understand the internal working of the many subjects which come before the councils for consideration. So long as party strife continues in our municipal affairs it is hopeless to attempt to get the best results.

Year after year public authorities are called upon to undertake more work, the anxieties of official life, the constant strain, the feeling that a well-earned income is grudged by many, makes the position of all officials more difficult. It is high time that all public officials should bind themselves together to bring about a proper and adequate remuneration for services rendered. At the same time no person should hold an appointment unless he is fully qualified and competent to fulfil the duties, no matter how small or unimportant the district may be, for the village of this decade may be the important town of the next, and a neglected district in these days of intercommunication, without efficient official equipment, may be a source of danger to larger districts, or even to the nation at large.

It is to be hoped that these remarks will not be misunderstood or misjudged by the public; but twenty-five years of public life have taught me many lessons, and I should be wanting in my duty to the rising generation of officials if I did not endeavour to do my little towards making their lot brighter and more prosperous than the lot that has fallen to many in the past. We in this country are responsible for the welfare and prosperity of nearly one-third of the human race. We are also responsible to posterity to improve the physical condition of the people of our country, whereby the race may be enlightened and improved, and thus be fitted to govern this great Empire. Individually we perhaps cannot do much, yet each of us can, in our humble way, contribute our mite to the common stock of human happiness, progress and prosperity, and so leave to our sons, and their sons, examples of sanitary practice which will contribute to the health of this great nation.

The subjoined papers afterwards came before the meeting for discussion:—

SEWAGE DISPOSAL IN RURAL DISTRICTS.

By Ascough Rodwell,
Engineer and Surveyor, Skipton Rural District Council.

This subject covers a wide field, too wide for its thorough investigation in the limited space allotted to this paper; so, to facilitate matters, the author takes the liberty of referring to a rural district (as a typical one) with which he has had some acquaintance.

This district is in some parts very scattered, while in others the contributory places consist of mills and streets, making them really urban in character. In these latter cases proper sewerage schemes are inevitable. The closets are principally on the water-carriage system, and the sewage containing comparatively little trade effluent is easily dealt with by settling tanks, the effluent being treated on land (if suitable land is available) by some type of percolating filter, or by contact beds.

For villages, the disposal works should be as simple as possible, as in very few instances only can a man be fully employed in looking after the works. In every case the sewage should pass through some form of settling tank to intercept the solids; and preferably with the tank in two sections, so that the sewage can be turned into one section while the other is being cleansed. The liquid may then be turned on to the land, or dealt with by percolating filters or contact beds.

For small village installations the author has used the ordinary rectangular trough distributor, having a central self-acting tipper, with double compartments, so that when one becomes full, and the contents are tipped over into the distributing shoots, the other compartment is in proper position for being filled in its turn. This apparatus is very simple, and only needs periodical attention and oiling about once a week. For larger villages the "Ideal" distributor (Tuke & Bell's) has been used. This is an open trough revolving distributor, the rotating motion being given by two pawls, working on a toothed base wheel, and actuated by a central tipper bucket. Each time this tipper becomes full, its consequent tilting action brings one of the pawls into contact with the toothed wheel, causing the distributor to swing round; at the same time the liquid flows into the revolving troughs. One edge of the trough arm being serrated, the liquid is divided and spread in fine streams over the surface of the filter. For beds of over 15 ft. diameter the author has fixed perforated-pipe arm distributors of the following types: Adam's, Candy-Whitaker's, Farrer's, and Ham, Baker's, also Mather & Platt's open trough; all doing good work.

For filtering media, broken bricks, broken stone, river gravel, clinker and honeycombed slag have been principally used, and the depth of the filter varied from 4½ ft. to 6 ft., according to the fall available to the outfall.

For isolated houses, the methods of dealing with the sewage are many. Some of the mansions have up-to-date sedimentation tanks, slate beds with automatic dosing valves, and everything of the latest type, while others (especially farmhouses) simply drain on to the nearest available land and distribute the sewage over the surface by open channels cut in the turf, the course of the channels being diverted on to new ground as circumstances require. Some farmhouses are provided with bath, water-closet, &c., and frequently the sewage is discharged into the ordinary manure tanks, which also takes the drainage from the farm buildings, the contents of the tank being pumped out into barrel carts and distributed over the meadow land in the usual way. The author does not advocate this method, as the tanks are usually not cleaned out often enough, and consequently the odour of the con-

tents becomes very offensive, and is still more pronounced during the emptying of the tank.

A small concrete sedimentation tank having a capacity of about twenty-four hours' flow with submerged inlet and outlet pipes and a filter of sand, fine gravel, or engine ashes will give excellent results, and, if attended to regularly, is a far more preferable method of dealing with the sewage of isolated houses. Also the self-contained tank and filter arrangements now made by two or three firms for the purification of sewage from country houses and isolated buildings are compact and effective; and only in very exceptional circumstances, where the contents can be regularly and frequently taken away, should the old type of cesspool be permitted. Of course, many houses have the ordinary block privy, they have no bath, so the only sewage is from the kitchen slop-stone, and the liquid from here is very frequently discharged into the nearest stone drain or brook. This may be termed the easiest way of disposing of the sewage, and certainly the old saying "out of sight, out of mind" is very applicable. The author has known a village of 90 or 100 houses dealt with in this way, until the river authority came along and insisted upon a proper scheme of sewering; the people were quite content; they enjoyed good health, and, notwithstanding the fact that the stone drains all emptied into the stream which ran through the village, the stream was simply alive with trout, and the fishing of the river just below was regarded as one of the best lengths in Yorkshire; the chances of one's election as a member of the local fishing club being very remote.

At one village of about 200 inhabitants where sewage works have been established, the treatment is by simple tanks, the effluent being turned into open channels on to the land. One day the author received a complaint from the river authority that it appeared from a report by the inspector the effluent from —— works discharged into the river was not satisfactory, and would he be good enough to see the matter was attended to at once, &c. He immediately visited the works, and certainly the effluents where it joined the river was a trifle cloudy, but about a yard away from the effluent pipe was a group of some of the finest trout he has ever seen (most of them, he estimated, would turn the scale approaching 1 lb. each), all their noses were pointing in one direction, waiting for some tasty morsel coming down the pipe.

In another case, where the drainage of a village of about twenty houses simply consisted of stone drains discharging at different points into the river, the council had their attention called to the "serious pollution," &c. It was plain to see where the various drains terminated at the river, but the water in the river was beautifully clear, and, out of mere curiosity, the author had a sample of water taken below the village (this was after the river had received all the so-called pollution) and sent for analysis. The following is the footnote on the report:—

"This is a very soft water of moderate organic purity, suitable for both drinking and domestic purposes."

These two instances are mentioned simply in support of the contention "that there ought not to be the same rigid requirements as to the standard of purity of the effluent from small rural villages (where the quantity of sewage effluent is, comparatively speaking, [illegible] drop in the bucket") as is necessary for towns where the quantity discharged into the stream is, of course, much greater.

When, however, the effluent has to be discharged into a small stream (which in summer time is probably dried up) the standard of purity should, of course, be higher. The author has in his mind an instance of this kind, where the effluent was discharged into a stream below a weir belonging to a corn mill: when the mill was working, all the water flowed along the mill race to the mill. Thus there was no water in the stream itself, except the effluent from the sewage works, and this being the only water supply for the cattle pastured in the land alongside the stream below the works it was absolutely necessary that the effluent should be as pure as possible.

The modern methods of dealing with sewage by tanks, bacteria beds, &c., has enabled disposal works to be placed much nearer the houses than was permissible when the method of treatment was by broad irrigation, or even intermittent filtration over land. Also the area of the land required for the works is much smaller. The council have just recently completed disposal works for two villages, the combined population being over 600. The works consist of sedimentation tanks, percolating filters, storm-water tanks and filter sludge beds, hydrant tank and tool house, and the whole area, including fence walls, measures less than half an acre.

SEWAGE TREATMENT.—ADVANTAGES OF LAND OVER ARTIFICIAL SCHEMES.

By John Manley.

The practical and economical treatment of sewage is an interesting subject, which concerns everybody, is inexhaustible, and, like the poor, always with us.

Many books have been published, many papers read, many lectures given, much discussion taken place, and many opinions formed which have frequently changed, as to whether land treatment, some artificial scheme, or a combination of both is the most economical and effective.

The cry, "Back to the land!" is one which we have all heard, again and again, and is not inapplicable to the subject before us. It is satisfactory to note, and the writer claims this to be one of the advantages of land, it is always ready to receive and able to deal with whatever humanity offers. It is further claimed that land is permanent, and as a medium for the purification of foul matter has held its own through all time. On the other hand, much-advertised artificial schemes of fifteen to twenty years ago have sunk into oblivion. We hear nothing now of the "Ducat" or "Scott-Moncrieff" processes, and very little of the "Cameron" process. Although such schemes, constructed at very great expense to the authorities concerned, may be working with more or less satisfaction to those authorities, yet they have not been generally adopted or copied by engineers acquainted with them.

From the Public Health Act of 1875 passing into law to a very recent date, it was the invariable practice of the Local Government Board to refuse sanction to any loan for sewering or sewage disposal works, where there was no provision of a suitable area of land for sewage outfall works (usually called a sewage farm); a very wise precaution, because such land not only provided a site for whatever works might be adopted, but also for the deposit of house refuse where it could be properly dealt with, and if properly laid out would deal with the sewage in all exigencies, accidents and instances where artificial schemes failed. But recently the Local Government Board, with its present president, has not strictly adhered to this rigid stipulation. The agitation against it was very strong for many years, and led to the appointment of a Royal Commission on May 7, 1898, with Lord Iddesleigh, C.B., as president, to inquire and report:

I. (1) "What method or methods of treating and disposing of sewage," &c., "may properly be adopted," &c. (2) "If more than one method may be so adopted, by what rules, in relation to the nature or volume of sewage, or the population to be served or other varying circumstances or requirements, should the particular method of treatment and disposal to be adopted be determined"; and

II. "To make any recommendations which may be deemed desirable with reference to the treatment and disposal of sewage."

The first result was the issue of a short interim report in 1901, which expressed the opinion that downward filtration and broad irrigation were the best means to adopt; the Local Government Board's rule for insisting on land was a good one; stiff clay land was unsuitable, but no land was useless, much depends on the depth of top soil, but a larger area helps.

The report then dealt with artificial processes then in use—*viz.*, closed and open septic tanks, chemical treatment, subsidence tanks, contact beds and continuous filtration, in various combinations; arriving at the conclusion that it is possible to do with artificial schemes in some cases (Leeds and Manchester), but no general rule was possible for dispensing with land.

At the Health Congress at Exeter, August, 1902, Lord Iddesleigh is reported to have said: "They (the commission) would soon, he hoped, be able to publish the results of a prolonged investigation into the treatment of sewage on land; their experts were now making elaborate parallel examinations of some of the processes of filtration by artificial means. . ." "The subject was inexhaustible." The position seems to be much the same to-day. The commission is still investigating, but has issued seven reports of which, for the purpose of this paper, the fifth is interesting. It refers to 144 meetings and the examination of 204 witnesses.

On page 18, we read: "It is true that at (several towns are named), and elsewhere, crude sewage has been satisfactorily purified in filters with almost complete absence of nuisance, but at most of these places

this plan has been abandoned, because of the rapid choking of the filters." Page 22: "As regards the second claim, we find as a result of a very large number of observations, that the sewage issuing from septic tanks is, bacteriologically, almost as impure as the sewage entering the tanks." Page 44: "In the majority of cases we think it would be better to adopt chemical precipitation, rather than septic tanks, as the preliminary process for very strong water-closet domestic sewages."

Contact beds and percolating filters, with sprinklers or other distributors, are more favourably spoken of, the latter being the more efficient. After very exhaustive detail automatic gear, loss of capacity, construction, dimensions, size and grading of filtering material, cost, &c., and a general summary favourable to percolating filters, except that they are more liable than contact beds to nuisance from smell and flies, we find these general conclusions—*viz.*:—

"We are satisfied that it is practicable to purify the sewage of towns to any degree required, either by land treatment or by artificial filters, and that there is no essential difference between the two processes, for in each case the purification, so far as it is not mechanical, is chiefly effected by means of micro-organisms."

"The selection of a method of sewage disposal should depend primarily on local conditions."

"If a sufficient quantity of good land, to which sewage can gravitate, can be purchased for about £100 an acre, land treatment would usually be the cheapest method to adopt."

"In cases where only clay land is available, it would generally be cheaper and more satisfactory to provide artificial filters."

In comparison of effluents "judged by chemical analysis," the report says: "Both classes of effluent possess similar qualities."

As regards eight farms not eliminating suspended solids, the average purification was about 98 per cent as regards seven contact-bed plants, but eliminating suspended solids 93·4 per cent.; as regards six installations of percolating filters, after eliminating suspended solids, was 99·4 per cent.

There is one other great disadvantage in contact beds and percolating filters, which applies to a great number of cases—*i.e.*, where a low-lying district, or area, gives a low gradient to the stream which has to receive the effluent. Land treatment presents no difficulty. Screening and detritus chambers can be made shallow, and the carriers' follow the contour lines, but the depth of each contact bed or percolating filter must be added where adopted, often necessitating raising the sewage.

Attention is now invited to successful instances of land treatment. First, small towns:—

(1) Redruth (Cornwall). Designed by the late Silvanus W. Jenkin, M.INST.C.E., and carried out in 1889-90. Population about 10,000. Twenty acres of land, let at a small rental to farmers, who took all responsibility. The effluent discharging into a small stream by the side of a main road, the stream finding its way to Portreath, a small harbour 3½ miles distant. The writer inspected and reported on it in 1892 and 1895.

(2) Wokingham (Berks). Three small sewage farms, an aggregate area of 13 acres; population 5,000. The writer took charge of them in 1897 as borough surveyor. The Thames Conservancy take samples of the effluent periodically, and exact a high standard. The soil being stiff clay made it difficult, and chemical precipitation had been introduced; but by cultivation of the land, collecting and burning house refuse, then putting the ashes on the land, its quality was soon improved, and it was found possible to do without precipitation. Contact beds have, however, since been constructed for a portion of the sewage only. Last year the corporation purchased over 20 acres of adjacent land.

As examples of greater magnitude, reference may be made to the Berlin sewage farms (43,009 acres). (Notes prepared by Mr. H. Alfred Roechling, M.INST.C.E., F.G.S.*) Here we are told of the successful disposal of sewage from a population of 2,137 034 by land treatment, with a profit of 11·1s. per 1,000,000 gallons on the working expenses.

A better example, or rather one more likely to be followed, is the Aldershot Camp Farm, with which the writer is better acquainted. This for seventeen years has been managed by Lieut.-Colonel A. S. Jones, V.C., M.INST.C.E., of whom the writer referred to in the last paragraph says in a book published ten years ago: "Colonel Jones has done more than any-one else living to establish correct views on sewage farming." This farm consists of 131 acres, but allowing for roads, buildings, &c., 120 acres are under cultivation. It dates from the return of the troops from the Crimea in 1856. When Colonel Jones took it in hand in May, 1895, the farm was in bad repute and was in a bad condition, having been for fourteen years leased by the War Office to a tenant who paid rent, but failed to satisfy the Thames Conservancy. These conditions were soon altered, and for fifteen years have been ideal. The subsoil is sand and gravel, the surface nearly flat, all under-drained by 3-in. pipes 12 yds. apart, the main drains 6-in., 9-in. and 12-in., the effluent gathered to one point, whence it flows in an open dyke about 250 yds. to the river Blackwater, which also receives the effluent from Aldershot Town, 1 mile or so above. The carriers (nearly all land furrows) follow the contour of the land, having been carefully levelled, are about 20 yds. apart, and are reformed every two years. The population is usually 30,000, the estimated daily flow 1,000,000 gallons. The Connaught Hospital, with medical officers' and nurses' quarters, quite new buildings, are within 200 yds. of the farm boundary, and are supplied with milk from the farm, which also supplies other hospitals.

The sewage is received at four points, known as Wellington lines (15-in.), Stanhope lines (15-in.), Marlborough high-level (12-in.), Marlborough low-level (12-in.), each of which has catchpits (or detritus chambers), screens, and subsidence tanks, from which the sewage passes on to the land; the deposits are mixed with manure from cows and sold or used on War Department land at the Royal Military College and Remount Depot. Rye grass is sold and delivered at 30s. per ton if within 2 miles, beyond two £2 per ton, if fetched at 20s. per ton.

The buildings consist of a good house for farm bailiff, six good cottages, offices for manager and bailiff, a well-designed and appointed dairy, two stables of six stalls in each (one being for large cart-horses, the other for cobs), two houses of superior design, each for twenty-four dairy cows, with 1,000 cub. ft. per cow, a yard and shed for bullocks, and an engine-house, which contains a 4-horse power engine to work chaff-cutter, &c., a vertical boiler, which provides steam for boiling and steaming all dairy utensils. Special precautions are taken by boiling all dairy churns and vessels once a week in summer, and once a fortnight in winter, thereby insuring perfect sterilisation. All produce is weighed, and records elaborately kept, each cow (usually forty are kept) is numbered, and its milk weighed separately, morning and evening, the record for June 26th averaged 17·18 lb. in the morning, 15·36 lb. in the evening, or 3·16 gallons per cow for the day; the cows are usually purchased soon after calving, kept as long as profitable, then sold for feeding. Young bullocks are also bought when a year old, kept a year, then sold at a profit of from £4 to £5. There is also a store sow with its young pigs always kept to consume dairy washings and waste. Rye grass is the principal product, but root crops are also grown. About thirty hands are employed, and the farms of Sandhurst Royal Military College, Pirbright and Ewshot Barracks (at each of which one man is kept), are administered and worked from the camp farm. The writer went over it on a fine day (June 27th) and a wet evening, after a heavy rainfall (July 2nd), and found its appearance excellent and the effluent free from smell, colour or offensive taste.

* See THE SURVEYOR, November 17, 1911.—Ed.

ONE SOLUTION OF THE SLUDGE PROBLEM.

By ARTHUR HINDLE, M.INST.C.E., and P. HOLT WHITAKER, ASSOC.M.INST.C.E.

Of the many difficult problems which the sewerage engineer is called upon to solve none gives him more anxiety than the one connected with the satisfactory disposal of sludge.

The authors (in common with other engineers who are called upon to advise local authorities as to their sanitary arrangements) have been faced with this difficulty, and at some sewage disposal works recently carried out under their guidance have installed a system of treating the sludge, which has proved so efficient as to justify them in giving a brief description thereof, in the hope that it may be of some interest to their professional colleagues. The system referred to was provided at the sewage disposal works, which the authors designed and carried out for the Penrith Urban District Council.

Before explaining the system of sludge treatment it

will probably assist in following the description if a brief explanation of the scheme of sewage treatment adopted is first given.

Penrith is a market town in Cumberland, and has a population, according to the last census, of 8,993. There are no works or manufacturers beyond two small breweries, so that, with this exception, the sewage is purely domestic.

The original sewerage works for Penrith were carried out in the year 1850, and comprised a system of main sewers and sewage disposal works on the broad irrigation system on a large area of land known as Westmorland Holme, situate near Eamont Bridge, about 1 mile from the centre of the town.

The new works, which are now practically completed, comprise an entirely new system of main and subsidiary sewers throughout the town, an outfall sewer about 2¼ miles in length, including crossing of the river Eamont (which was done by means of a gravitating cast-iron pipe carried by a lattice girder bridge of 120-ft. span), and sewage disposal works on lands forming part of Whinfell Holme, which were acquired from Lord Hothfield, the price being fixed by arbitration. An area of 25 acres was acquired, but only about 12 acres have as yet been laid out. The subsoil is eminently suitable for filtration purposes, consisting of a deep bed of gravel, which is overlaid with about 2 ft. of fibrous soil.

The sewage treatment consists of sedimentation in tanks and filtration through land on the intermittent downward principle. There are four circular sedimentation tanks, each 40 ft. in diameter and an average of 7 ft. 6 in. deep, so arranged as to enable them to be worked on the quiescent or continuous-flow principle, either separately or in series, as circumstances dictate. Inlet and outlet channels, junction wells and controlling valves are provided.

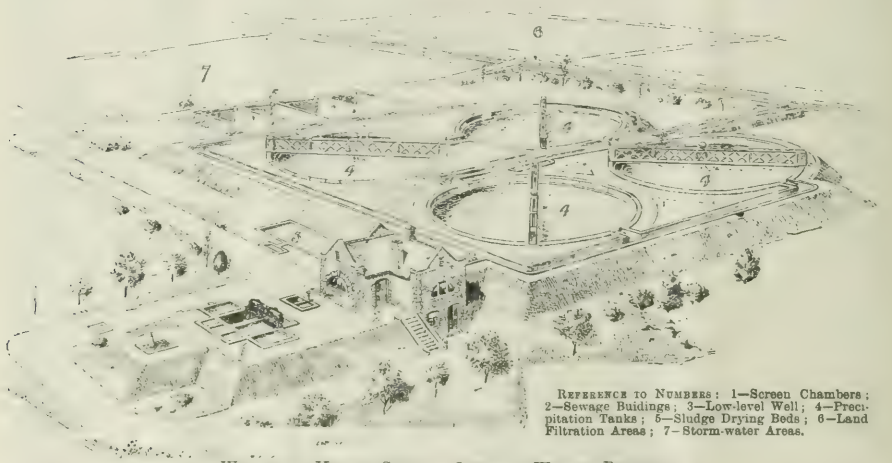
Before entering the tanks, the sewage passes through screening chambers, which are arranged in duplicate and fitted with Stott's revolving screens. Between the screening chamber and the mixing buildings there is a dividing well whence the storm water flows to specially prepared areas. Three times the dry-weather flow passes to the works for full treatment, and three times passes to the storm-water beds. The buildings comprise mixing-house, small engine-house, with oil engine and pump, store-room, and office. Up to the present time it has not been found necessary to use any precipitants, but arrangements are made in the mixing-house therefor should their use ever be required.

After leaving the tanks the effluent passes over aëration weirs, thence into a main carrier, and is subsequently distributed by means of subsidiary carriers over the land filtration areas, which are underdrained with 3-in. agricultural tiles, the number depending upon the nature of the subsoil in each area, and these in turn are connected to a main effluent drain, which discharges the purified effluent into the river Eamont, a well-known fishing river.

The levels of the outfall works were such as did not permit of the sludge being drawn off from the bottom of the tanks so as to gravitate to the sludge drying beds. It was therefore necessary to provide some means of lifting it to the desired level without, if possible, incurring the cost of pumping. This was accomplished by utilising the head of water in the tanks for the purpose of forcing the resultant sludge to the drying beds, and to assist in this object an apparatus known as Fidler's revolving scraper was placed in each sedimentation tank.

The Fidler scraper arrangement is intended to facilitate the removal of sludge without interfering with the continuous working of the sedimentation tanks and to deliver the sludge at a level only a few inches below the top water level of the tank. The scraper, by means of which the sludge is directed to a sump in the bottom of the sedimentation tanks, is helical in form; it is attached to and supported from a lattice girder, and is rotated by gearing fixed at the side of the tank adjacent to a sludge discharge chamber so as to give opportunity for careful regulation of the discharge. When it is desired to remove the sludge the scraper is revolved and the sludge directed into the central sump from the bottom of which it is forced to the sludge drying beds. Valves are provided on the several pipes to regulate and control the flow.

The sludge drying beds are four in number, each 25 ft. long by 10 ft. wide by 6 ft. deep; they are constructed of brickwork, backed on the outer side with concrete: the floors are made of concrete laid with proper falls in the direction of the drains. Each bed is provided with doors, constructed in sections, extending the full width of the bed at the lower end, which can be raised or lowered at will as the material in the beds increases or decreases. Cross walls are formed of perforated boards laid in grooves, so as to be easily adjusted.



Reference to Numbers: 1—Screen Chambers; 2—Sewage Buidings; 3—Low-level Well; 4—Precipitation Tanks; 5—Sludge Drying Beds; 6—Land Filtration Areas; 7—Storm-water Areas.

Whinfell Holme Sewage Outfall Works, Penrith.

When the sludge is about to be emptied from the sedimentation tanks, a layer of straw, litter, dried weeds or the like is first laid in each tank or compartment in such a manner that the whole surface of the bed is covered, the litter is also drawn slightly up the sides of the beds or compartments, as well as round the vertical, perforated pipes or shafts. These perforated, vertical pipes are about 6 in. in diameter, in lengths of about 2 ft., provided with sockets and spigots so that they can be built up in continuous shafts from the floor to the top of the bed as it is being filled. A layer of sludge, to the depth of 4 to 6 in., is then run on to the litter, which acts as a filter, the litter allowing the liquid to filter through and find its way to the perforated pipes, which in turn are connected to drains laid on the floor of the beds. This operation of filling the beds alternately with litter and sludge is repeated until the bed or compartment is filled, when operations are transferred to the next bed. The liquor draining from the sludge beds is conveyed to a well, and is then pumped (by the oil engine and pump previously referred to) into the feed channel of the tanks for retreatment. As the beds are being filled the increasing weight compresses the sludge and litter, thus forming, after proper settlement, a firm bed of manure, which is easily handled and is very portable. A layer of litter is always placed on the top of a layer of sludge to obviate any nuisance from smell

which one usually expects to arise from open sludge beds or lagoons.

The authors were assisted by the surveyor to the Penrith Urban District Council, Mr. J. J. Knewstubb (member), who acted as resident engineer throughout the construction of the sewerage works, and who has supplied, for the purpose of this paper, the following information:—

Population dealt with in the scheme, 8000.

Daily dry-weather flow per twenty-four hours, 290,000 gallons.

Quantity of wet sludge passed on to the beds per day, 2½ tons average.

Quantity of dried sludge taken out of the beds per day, 16 cwt. average.

Quantity of dried sludge removed from the beds and sold per annum, about 300 tons average.

Quantity of litter used in the beds per year, 70 tons.

Length of time occupied in drying the wet sludge. This varies according to the season but averages about six weeks.

Length of time occupied in filling one bed, about four weeks. This again varies according to the time of the year, and atmospheric conditions.

Rate of consolidation, varies according to depth of bed.

Length of time required for the dried sludge to attain its most beneficial condition as manure after removal from the beds, twelve months.

The sludge is sold by open tender every year, and the average price per cartload realised has been 1s. 9d. per load.

The authors are informed that the manure removed from the sludge beds after treatment under this system is most beneficial for use on land growing turnips and mangolds, and also gives good results for clover and seed grass at any time and almost under any condition. It has also been found to be an excellent material for ploughing into land of a light character.

No additional expense is placed upon the council in dealing with the sludge, as the operation of filling the beds is performed by one of the regular men employed on the farm, and occupies but an infinitesimal portion of his time. The emptying of the beds is undertaken by, and at the expense of, the purchaser of the dried sludge, who also provides and brings to the beds part of the litter required; this, of course, being a consideration of the purchase price.

So far as Penrith is concerned the sludge problem has been solved; the authors have, however, up to now hesitated to supply any description of the system as they were desirous it should have a fair and ample trial before doing so.

This description is given purely from an engineer's point of view, apart from that of the chemist. There is, however, the practical side of the question in that the farmers of the district are competitors for the dried material.

The works were completed in the latter part of 1907, were formally opened on, and have been in continuous operation since, March 19, 1908.

(To be continued.)

"A Note on the Extension Seawards of the Gynn Outfall Sewer at Blackpool," by Mr. John S. Brodie, M.INST.C.E., which was also presented to the meeting, will be found on a later page of this issue.

THE HEALTH EXHIBITION.

About one hundred firms are represented at the Health Exhibition which is being held in connection with the congress. Although perhaps not as large as some of those of former years, the display is one which is likely to prove of the highest interest to the small army of sanitarians who are making their home in York this week, for the exhibits illustrate all sides of public health work, from large appliances for town water supply and drainage, measures for the prevention of disease, down to the various sanitary fittings of the house and home, and even smaller matters relating to personal health and comfort. On Saturday afternoon—two days before the commencement of the congress itself—the exhibition was opened by Prince Arthur of Connaught. His Royal Highness was received by the Lord Mayor of York (Alderman Norman Green), the chairman of the Local Committee of the congress, the chairman of the council of the Royal Sanitary Institute (Mr. H. Percy Boulnois, M.INST.C.E.), the chairman of the judges (Mr. W. C. Tyndale), the town clerk of York (Mr. Henry Craven), the director and secretary of the institute (Mr. E. White-Wallis), the local secretaries of the congress, among whom are Mr. F. W. Spurr, the city engineer and surveyor, and the chairman of the Congress Committee (Mr. H. D. Searles-Wood). In an address to Prince Arthur, which was read by Mr. Percy Boulnois, appreciation was expressed of the honour conferred upon the institute by the presence of his Royal Highness. It was pointed out that the institute, founded nearly forty years ago, had now a membership exceeding 4,000, and had since its formation carried on a large work in promoting a knowledge of sanitation and health, not only in Great Britain and Ireland, but also in the Empire of India, the Dominion of Canada, the Commonwealth of Australia, the Union of South Africa, in New Zealand, and other parts of the British Empire. In declaring the exhibition open, Prince Arthur quoted Lord Rosebery's recent observation that this was "an age of congresses—some eminently useful and others superlatively superfluous." He felt sure all would agree with him that the present one came into the category of the eminently useful ones. They owed a great debt of gratitude to the Royal Sanitary Institute for having awakened public opinion to an appreciation of the vital necessities of good sanitation, and he hoped that the exhibition he now had the pleasure of declaring open would serve as an additional means of education.

His Royal Highness afterwards made a tour of the exhibition.

SOME OF THE EXHIBITS.

ADAMS-HYDRAULICS, LIMITED.

This well-known York firm are "showing" on a somewhat modest scale at Stand 47. Their exhibits consist wholly of photographs and prints; none the less, these quite effectively indicate the nature of the company's works and are deserving of examination by visitors.

WILLIAM BOBY.

At Stand 41 Mr. Wm. Boby, of Salisbury House, London, E.C., exhibits his automatic continuous water softener and purifier. The type "K" water softener, which is exhibited at work, is especially adapted for domestic supplies in households, being made in capacities from 200 gallons per day upwards. The machine is designed so that it requires attention at infrequent intervals. The Boby type "K" softener is substantially constructed of steel, bronze and other materials suitable for the purpose, enabling it to supply softened water for all household purposes, including potable water, and water in such a condition as to reduce household labour and use the minimum of soap. The type "K" softener is also constructed of proportions suitable for dealing with the supplies of public institutions, and of such bulk as to treat the entire water supplies of towns. A distinctive feature of the machine is that no reagent solution is employed, the attention required taking the form of simply placing some powder in a circular box.

CHADDOCK VENTILATION COMPANY, LIMITED.

The above-named firm, whose business address is 22-25 Cornhill, Wapping, Liverpool, are the inventors and manufacturers of automatic window ventilators, which, as is practically illustrated at Stand 71, are mechanically adjusted on a plenum basis in such manner as to enable the operator to regulate the direction of air movements and avoid discomfort to inmates of a room. A free-running, sliding sash provides a good weather joint, at the same time affording facilities for cleaning both sides of the glass from inside the building.

CLAUGHTON BROTHERS, LIMITED.

Sanitary fittings in considerable variety are on view at Stand 61, which is in the occupation of Messrs. Claughton Brothers, Limited, Sanitary Lead Works, Bramley, Leeds. The exhibits here include the "Niagara" patent lead-lined syphon cistern or water waste preventer (horizontal type), the "Japkap" patent syphon water waste-preventing flushing cistern (vertical type), the "Adaptable suspension" washdown closet, with slop top and lead trap, a silent-filling ball valve for flushing cisterns, and so forth. Improved lead foot traps for a large variety of closets, and "Enterprise" cast-lead junctions, with several kinds of sockets and connections to closet soil pipe. Cast-lead soil pipe terminals, sockets, and cast and

wrought lead rain-water heads, gutter and ornamental work, are other features of the stall.

COBRA DRAIN AND PIPE CLEANSER, LIMITED.

This firm, whose offices are at 21 Lepper-street, Belfast, are represented at Stand 69, their exhibit being the "Cobra" drain cleaner. The apparatus in question is intended for overcoming stoppages in sanitary and other pipes without opening up or otherwise disturbing the latter. The obstruction can be caught and withdrawn by means of the toothed jaws or head attached to a flexible-steel tube or spring,

Boiler with cylinder detached.

Boiler and cylinder with casing.

which is specially constructed to pass any bends met with. Through the tube passes a flexible pull with handle, which, upon being pulled, causes the toothed jaws to open and grip, fastening firmly upon any obstruction met with, and holding it until withdrawn.

DARLINGTON CONSTRUCTION COMPANY, LIMITED.

The Darlington Construction Company, Limited, of Bank Top, Darlington, are exhibiting a small building illustrating the various methods in which they construct their composite hospital, sanatoria and school buildings. The outer wall is divided into three sections, one panel having roughcast cement work, another panel "Eternit" sheeting on the outside, and a third panel weather boarding. The inside of the building is lined with "Eternit" fireproof sheeting, and the roof of the building is also covered with "Eternit" tiles (terra-cotta colour). The firm are also exhibiting various models showing packings used between the outer and inner covering of the walling, and a small model of a bungalow, with "Eternit" tiles on the roof. This stall (No. 39) is a joint exhibit of the above company and Messrs. G. R. Speaker & Co., of 29 Mincing-lane, London, E.C., British agents for "Eternit" tiles and sheets.

WM. DOVE & SONS.

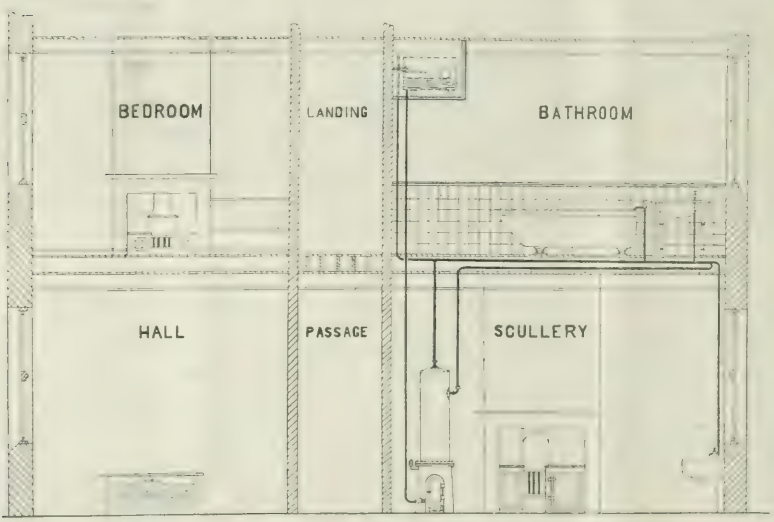
One of the most effective exhibits is that arranged at Stands 59 and 60 by Messrs. Wm. Dove & Sons, ironmongers and hot-water engineers, of Parliament-street, York. The complete fireplaces which have been fitted up make a particularly fine show, while various types of stoves, baths, hot-water boilers and radiators are other items of interest.

WILLIAM HARRIMAN & CO., LIMITED.

A large space has been taken by Messrs. Wm. Harriman & Co., Limited, Newcastle-on-Tyne, the sole manufacturers of Barron's patent sanitary specialities, the firm's exhibits—which are to be found at Stand 29—including closets, stoneware traps, sewer interceptors, channel bends and benchings, stable gullies, rain-water receivers, waste-water preventers, and "Newham" false floor tiles for ventilating and draining bacterial filters and contact beds.

HYGIENIC CONSTRUCTIONS AND PORTABLE BUILDINGS, LIMITED.

The above-mentioned firm, whose offices, works and showrooms are at Stockholm-road, South Bermondsey, London S.E., are the manufacturers of the well-known portable "Doecker" buildings for hospitals, schools, sanatoria, bungalows, offices and portable buildings. A number of models illustrative of the system are to be seen at Stands 3 and 5. As was recently explained in these columns, the buildings are constructed in two types—strong construction and light construction. They consist of sections fastened together with patent hooks and clips, are thoroughly portable, notwithstanding their great durability, and, with reasonable care, are claimed to last as long as fifty years. They are well lighted and splendidly ventilated and embody the maximum of comfort and the requirements of modern hygiene.



Jones & Attwood's "Batheater" System of Hot-water Supply

IMPROVED SANITARY APPLIANCES COMPANY.

At Stand 46 the attention of visitors to the exhibition is directed to this company's latest sanitary improvements in the form of cantilever sink traps and adjustable cantilever water-closets. The first-mentioned apparatus is a combination of a cantilever to carry the sink, a trapped waste pipe, inspection and cleaning arm, and head on back of wall to receive other waste pipes, glass lined inside, galvanised or enamelled outside. The adjustable cantilever water-closet comprises

the soil-pipe junction, branch piece and trap, all in one casting, and is so arranged that only one joint requires to be made, instead of four as at present. This branch piece tapers 3 in. at the trap to 4 in. at the soil pipe, so that it will not stop up. The inside is glass lined. Both the cantilever and earthenware basin can be set to any angle or plan to suit various required positions the soil being thus conveyed in a straight line direct to the perpendicular soil pipe. The firm's address is Queen's College, Paradise-street, Birmingham.

JONES & ATTWOOD, LIMITED.

One of the most striking and, apparently, the largest exhibit is that of this well-known Stourbridge firm of hydraulic engineers (Stand 52). Two large working models are shown illustrating the application of the "Sewage Wheel" to circular and rectangular beds suitable for the sewage disposal for a country house, or for the largest schemes covering many acres, with efficiency and economy. Fixed sprinklers of various types are other products of the firm, in addition to sluice valves, adjustable discs and ratchet penstocks, screw-down penstocks, disc valves, floating-arm outlets, and screens. Heating apparatus for domestic hot-water supply and for the warming of buildings forms another important branch of the company's work. The "Bath-ater" boiler and circulating

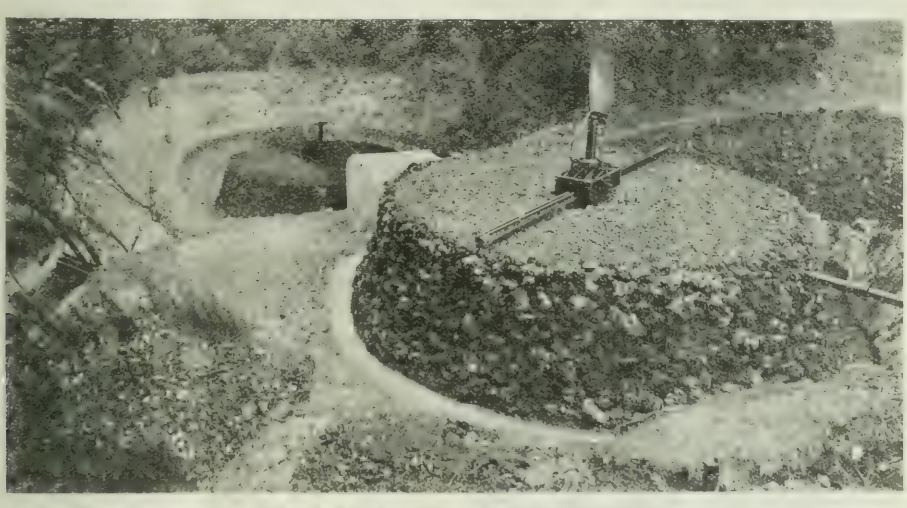
damp courses, and so forth, and specimens of "Lithofalt" asphalt paving blocks, 9 in. by 4½ in., of different thicknesses, and with plain or grooved surface, for carriageways, form an interesting display at Stand 72. The firm have recently supplied to the Hampstead, Poplar, Folkestone, and other borough councils about 125,000 super. ft. of their blocks for carriageways in these boroughs. Under their method of laying these blocks direct on to the concrete, the borough engineers have found it possible, under their own supervision, and by the direct employment of their council's workmen, to lay an average of about 75 super yds. per man per day. By obviating the necessity for putting in a special bedding material, and on account of the facility with which these blocks can be handled, the cost of laying is, under this method, stated to be reduced to about 3d. per super yd., all labours included.

McDOUGALL BROTHERS.

Disinfecting fluids and powders are among the exhibits of Messrs. McDougall Brothers, Port-street, Manchester, at Stand 53.

MOULE'S PATENT EARTH-CLOSET COMPANY, LIMITED.

Sundry models and articles at Stand 70 illustrate Moule's patent earth-closet system for domestic and municipal sanitation. The business address of the



Tuke & Bell's "Ideal" Sewage Distributor.

cylinder combined may be specially referred to. This is intended for fixing in kitchen or scullery, and designed particularly for use with hard waters containing much sediment. The cylinder can be easily removed, exposing the whole interior of the boiler and cylinder, so that every portion can be thoroughly cleaned, thus prolonging the life of the boiler.

KIRTLEY & SON, LIMITED.

At Stand 62, Messrs. Kirtley & Son, Limited, Mowbray Buildings, Sunderland, are showing the "Mowbray" patent earth-closet hatch. This has a metal frame and a steel door. The frame is built in the wall, flush with the face of it. The door closes tightly on the sole plate, and this largely prevents liquid matter oozing out, defacing the brickwork. The doors slide in a groove, and do not project into the street. They open to the full size, and cannot be lifted out and taken away. The "Mowbray" tipping ashbin is opened by the scavengers from outside with a key, and tipped right over so as to allow the contents to fall into a receptacle beneath, which is then simply lifted up and emptied into a cart standing alongside.

LIMMER ASPHALTE PAVING COMPANY, LIMITED.

Specimens of the Limmer Asphalte Paving Company's raw mineral rock asphalt, with photographs of the processes of mining and manufacture, samples of the rock as reduced to powder, and also in mastic form, models showing the application of the company's products as roofing, flooring, horizontal and vertical

firm is 2 Guildford-street, Russell-square, London, W.C.

ROBESON PROCESS COMPANY.

The exhibit of the Robeson Process Company, patentees and sole manufacturers of glutrin road binder, 17 Fenchurch-street, E.C., includes specimen footways, which have been treated with the company's glutrin road binder, adjoining the bowling green in the exhibition grounds. Photos are shown of various road and footway works where glutrin has been employed as a binder in England, France, Egypt, and other countries, also samples cut from actual roads treated by this process. Glutrin is a liquid binder, which is applied by means of water vans or hand sprinklers, water being added. Its use avoids any discoloration or smell, while firmly binding the constituent parts of the road or path, and rendering it proof against the action of heat, frost and moisture. It is harmless to animal and vegetable life, and to fish, and does not make a slippery surface. For use on private estates glutrin will, it is claimed, be found an ideal binding medium.

"RONUK," LIMITED.

One of the first stalls to claim the attention of visitors to the exhibition is that of "Ronuk," Limited, sanitary polish manufacturers, of Portslade, Sussex. The stand (No. 2) is to be found on the right-hand side immediately after entering the building, and the exhibits include specimens of flooring prepared and polished by "Ronuk" improved sanitary methods; hospital "Ronuk" concentrated, and hospital "Ronuk"

liquids and "Ronuk" special staining, for colouring and hardening the surface of ordinary deal flooring previous to polishing.

"SANITAS" COMPANY, LIMITED.

The whole of the preparations of this firm are on view at Stand No. 1, including "Sanitas," "Creocide," "Okol," "Soldis," and carbolic disinfectants, Sanitas air purifier and sawdust, disinfecting inhalers and fumigating appliances, "Sanitas-Formigators," formic sulphugators, Kingzett's patent sulphur candles and sulphugators, Kingzett's patent preserved peroxide of hydrogen, Sanitas, carbolic, creocide, and pine soluble water-cart blocks, sanitary wax polishes, and soaps and [illegible]. The company's address is Lockley-street, Limehouse, London, E.

TUKE & BELL, LIMITED.

Sewage disposal and other apparatus form an interesting display at the stand of Messrs. Tuke & Bell, 69 Leadenhall-street, London, E.C. The firm's exhibits include the centre column and annular tank of a Carlton revolving distributor for a filter-bed 80ft. in diameter, the "Ideal" patent distributor for a filter-bed 9ft. in diameter, their semi-septic patent [illegible] tank and filter for small isolated dwelling-houses, and the "Grip" manhole cover and frame, with a 20-ft. clear opening. The first-mentioned machine is guaranteed to revolve with a 3-in. head of liquid above the holes in the distributing arms. The crown piece revolves on ball bearings, and roller bearings are provided at the base, so that friction is reduced to a minimum. The "Ideal" distributor has been proved to be exactly what is wanted for schemes in the country, as there are no holes to clog up, and it will go on working for weeks at a time with practically no attention. It is made up to 50ft. in length. Installations of the septic-tank and filter are now in use all over the country, and are stated to be giving the most satisfactory results, both as regards the effluent obtained, and with regard to the disposal of the solid matter, which forms a scum on the top of the tank, and has only to be removed three or four times in the course of a year. The "Grip" manhole cover, by means of concentric rings round the frame, is claimed to preserve the surrounding road material. When, however, the latter does eventually wear away, an inclined plane of road metal is formed to the edge of the cover, thus preventing any shock.

WEBB LAMP COMPANY, LIMITED.

At Stand 42 the Webb Lamp Company, Limited, 11 Poultry, London, E.C., show in operation their widely used sewer ventilating lamp, fitted with air meter indicating the amount of work done. Webb's patent non-return inlet ventilators for sewers, sewage tanks, and so forth, and silt dredgers, cleaning tools, are other exhibits of interest. In addition, the firm have placed on view an excellent selection of their gun-metal fittings for public buildings, these including hydrants, branch pipes and standpipes, the "Galvo" chemical fire extincteurs, and the "U.B.E.L." sprayer for disinfecting, whitewashing and other purposes.

LIST OF AWARDS.

SILVER MEDALS.

Wm. Boby, Salisbury House, London, E.C.—Type "K" water softener.

British Sanitary Company, 341 Bath-lane, Glasgow.—Earth-closets.

Chaddock Ventilation Company, Limited, 22-25 Cornhill, Wapping, Liverpool.—Reversible locking windows.

City of York Electric Lighting Department, 8 Clifford-street, York.—Hygienic value of exhibit of electrical appliances.

City of York Electric Lighting Department, 8 Clifford-street, York.—"Tricity" electric cooker.

Jones & Attwood, Limited Stourbridge.—Mono rail sewage distributors.

Model Abattoir Society, 25 Craven-street, W.C.—Model abattoir.

Beacon Light (Valveless) Gas Generator, Limited.—The "Beacon Light" [illegible] gas generator.

[illegible]

[illegible]

Y.E. Dutton Gas Lighting Company, Dewsbury.—Y.E. "Dutton" gas lighting apparatus.

BRONZE MEDALS.

Claughton Brothers, Limited, Sanitary Lead Works, Leeds.—Sanitary lead work.

Wm. Dove & Sons, Parliament-street, York.—"Ideal" domestic hot water boiler.

Wm. Harriman & Co., Newcastle-on-Tyne.—Stonework trap for chemical laboratory sink.

Wm. Harriman & Co., Newcastle-on-Tyne.—Access bend to foot of soil pipe.

Improved Sanitary Appliances Company, Queen's College, Paradise-street, Birmingham.—Adjustable cantilever soil-pipe arm.

Jones & Attwood, Limited, Stourbridge.—Bath heater boiler and circulating cylinder.

Kirtley & Son, Limited, Mowbray Buildings, Sunderland.—Mowbray earth closet hatch.

Kirtley & Son, Limited, Mowbray Buildings, Sunderland.—Mowbray tipping ashbin.

Limmer Asphalte Paving Company, Limited, Caxton House, Westminster.—Mastic asphalt for roofs.

Moule's Patent Earth-closet Company, Limited, 2 Guildford-street, Russell-square, London, W.C.—Earth-closets with "Chucker" action.

McDougall Brothers, Port-street, Manchester.—Disinfecting liquids.

Parsons & Sons, 8 Endell-street, Long Acre, London, W.C.—Sanitary enamels.

Ronuk, Limited, Portslade, Brighton (Sussex).—"Ronuk."

"Sanitas" Company, Limited, Lockley-street, Limehouse, E.—Sanitas bactox.

Sanitaries, Limited, Statham-street, Pendleton, Manchester.—The bath basin.

Slack & Brownlow, Abbey Hey, Gorton, near Manchester.—"Brownlow" spanner.

J. H. Shouksmith, 132 Micklegate, York.—"Health water" pipes.

John Walker Steel, 31 Northgate, Hartlepool.—Wind adjusted shelter.

Austral Window Balance Company, 3 Macdonald-lane, Corporation-street, Manchester.—The "Austral" window.

"Don" Fanlight Opener Company, 101 Leadenhall-street, London, E.C.—The "Don" fanlight opener.

"England" Works, 120A North-street, Leeds.—All steel cloak-room fittings.

Cobra Drain and Pipe Cleanser, Limited, 21 Lepper-street, Belfast.—The Cobra drain cleanser.

J. H. Walker & Co., Layerthorpe Bridge, York.—Terra-cotta goods, paving bricks and stonework.

Webb Lamp Company, Limited, 11 Poultry, London, E.C.—"Galvo" chemical fire extincteurs.

Webb Lamp Company, Limited, 11 Poultry, London, E.C.—Webb's sewer ventilating lamp.

DEFERRED FOR FURTHER CONSIDERATION.

Thomas Howse, Limited.—Paints.

Slack & Brownlow.—Brownlow germ filters.

Tuke & Bell.—Sewage distributors, &c.

A discussion on the new sewerage scheme for Lewes, with special reference to the discharge of effluent into tidal streams, will be opened by Mr. D. Roberts, the borough surveyor, at a meeting of the Royal Sanitary Institute to be held at Lewes on October 4th next.

Business Announcement.—Messrs. W. F. Stanley & Co. Limited, the well-known surveying, [illegible] drawing, optical, meteorological, and scientific instruments, and wholesale drawing office stationers, have opened a branch at 68 Queen-street, Glasgow.

Building By-Laws.—"Borough Engineer" is considering the revision of the building by-laws in force in his district, and would be glad to know of other towns which have recently revised their by-laws, and now have an up-to-date set. "Borough Engineer" says it is desired to go a good deal further than the Local Government Board Model Building By-laws, especially with regard to construction of roofs, floors, and so forth.

The Road Board and Road Improvements.—Mr. Masterman (Financial Secretary to the Treasury), replying to Mr. C. Bathurst in the House of Commons, said the grants made by the Road Board for works classified as road widenings and improvement of carriageways amounted to £73,180, but a considerable expenditure on the widening of metalled portions of carriageways was included in miscellaneous works of road crust improvement. The board proposed to apply [illegible] funds to such purposes in those cases which they might think should take precedence of other applications.

Institution of Municipal Engineers.

ANNUAL NORTH-WESTERN DISTRICT MEETING.

The annual meeting of the North-Western District of the Institution of Municipal Engineers was held at Clitheroe on Saturday last, when an attendance of over forty members and friends was recorded. Among the members present were Messrs. A. R. Bleazard (Clitheroe), F. W. Platt (Salford), J. W. Sunderland (Norden), J. H. Hopkinson (Chorley), A. Darlington (Billinge), A. Dempsey (Eccles), F. M. Hindle (Chadderton), C. H. Blakeway (Heaton Norris), T. S. Snorma (Liverpool), J. Whitaker (Burnley), G. Hayes (Westhoughton, honorary district secretary), and B. Wyand (secretary of the institution). Among the visitors were J. Wallman (Salford), V. W. Laithwaite (Turton), B. Boothman (Clitheroe), E. Arnold (Clitheroe), J. Helliwell (Clitheroe), H. W. Asman (Clitheroe), R. Barrett (Clitheroe), R. Hartley (Clitheroe), C. T. Welch (Clitheroe), J. Bolton (Clitheroe), C. Spackman and C. Spackman, junr. (of the Isis Portland Cement Company). The town council was represented by Alderman C. T. Mitchell (mayor), Councillors J. Cowman, W. W. Whiteside, J. Thornber, A. W. Musson and Greenwood, W. S. Weeks (town clerk), and J. H. Taylor (borough treasurer).

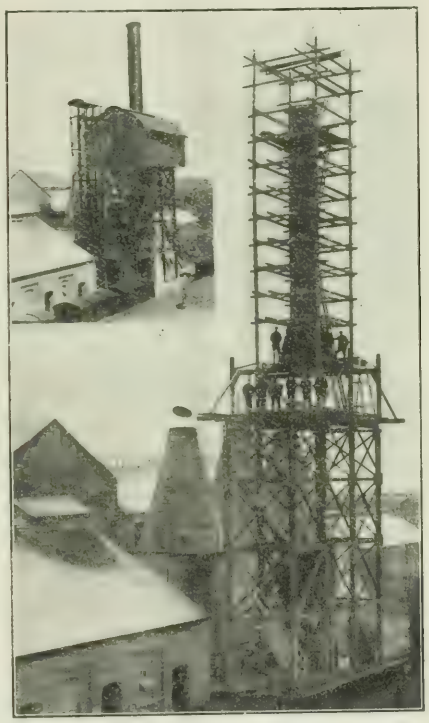
The party assembled at Clitheroe Station, and proceeded on a round of visits to the works of the Isis Portland Cement Company, the Horrocksford Lime Company's tar-macadam works, and Messrs. J. Carter & Co.'s stone quarries and tar-macadam works. The visit to the first-named works was particularly interesting, and the following notes are based upon the remarks made by the managing director of the works in receiving the visitors and upon notes taken during the round of the works.

SOME NOTES ON THE ISIS PORTLAND CEMENT WORKS.

These works are situated on a branch line from the Blackburn and Hellifield section of the Lancashire and Yorkshire Railway, and have exceptionally good transit facilities. The raw materials, limestone and clay, are obtained from land adjoining the plant. The limestone is quarried from the beds of the lower carboniferous formation, and varies considerably in its physical properties, some of the beds being extremely hard and crystalline, others amorphous and softer. The percentage of carbonate of lime varies from about 92 to 96 per cent. The clay is an alluvial deposit resting on the lower slopes of the limestone.

The clay as brought in is slightly roasted in heaps under large sheds, each heap when finished representing a month's requirements. The stone is delivered into works in wagons containing about 10 tons, the contents of each are sampled, and the carbonate of lime determined before unloading. The clay is free from lime, consequently the composition of the stone being known a simple calculation gives the correct proportion of each material. The mixture is by weight, is finely crushed in a swing jaw-crusher, and elevated to hoppers above the grinding mills. The grinding is in two stages. In the first, a somewhat coarse, gritty powder is obtained by grinding between burr stones. This is finished by tube mill to such a fineness that less than 5 per cent of residue is left upon a sieve having 40,000 meshes to the square inch. At this stage the composition of the mixture is checked, the percentage of carbonate of lime being determined in samples taken at intervals. By the method employed a determination accurate to within quarter of 1 per cent can be made in seven minutes. The raw meal or flour, as it is technically called, is received into a series of tall receptacles or silos, which not only serve for storage, but also as mixers. By means of extracting-worms a constant stream of previously ground material is drawn out, and is returned with the stream coming from the mills, while other worms are employed to extract that required for the next step of process. The material extracted is collected into one conveyer, at the delivery end of which it is mixed with about 10 per cent of water. The damp mixture is elevated to a floor above the presses, and by these it is formed into bricks which are passed directly to the kilns, of which two types are at present in use. An older one which works intermittently,* and for which a portion of the succeeding charge is dried in chambers by heated air obtained during the burning of the preceding one, and one shaft kiln just set to work. This works continuously, bricks as taken from the presses and coke being continually charged at top, while clinker is drawn below.

The kiln itself is constructed of steel plates lined with fire bricks, and it works with natural draught, special arrangements having been made to ensure a sufficient air supply, and consequently rapid burning and cooling of the charge. The charging floor is carried on an enclosing structure built up of broad flange beams, which also supports the chimney quite independently of the kiln. This is lined with specially made thin fire-bricks built in cement. The plates are bolted together, and the accompanying view shows the method employed for erection. A bolted scaffold formed of light quartering was carried up with each belt of plates, and firmly clasped to them. This at once served for lifting and bolting the plates and for putting in the lining. This type of kiln is being



Shaft Kiln in course of Construction at Isis Portland Cement Works.

(Inset shows completed kiln.)

repeated with some slight modifications. Our illustration shows the completed kiln. The older ones are in course of alteration to work continuously. The grinding of the clinker is in two stages, as in the case of the raw material. The whole plant is driven by a Pollit & Wigzell compound condensing engine of 450 i.h.p. The lighting is by arc lamps, power for these being obtained from a separate engine.

Leaving the Isis, the party proceeded to inspect the tar-macadam manufacturing plant of the Horrocksford Lime Company, Limited. In the absence of the manager, the members were shown round by the engineer (Mr. R. Parkinson) and the secretary (Mr. H. Parkinson). The process of manufacture was demonstrated and lucidly explained. The crude coal tar is stored in tanks having a capacity of 250 tons, and is mechanically pumped to three large distilling pans

F.*

* Described in Redgrave & Spackman's "Calcareous Cements," 2nd edition, p. 152.

(capacity 1,500 gallons), which are heated by steam coils to a temperature of from 220 to 250 deg. Fahr. Thence it is transferred to the mixer and comes in contact with stone which has previously been screened and passed through a continuous revolving dryer measuring 42 ft. by 3 ft. diameter, the drying being effected by means of warmed plates and hot air. The mixer has a capacity of from 10 to 15 tons per hour, according to the gauge of material, or from 100 to 150 tons per day. Messrs. Parkinson were cordially thanked for their kindness, the party expressing themselves as delighted with the excellence of the plant.

At the conclusion of the visits of inspection the delegates repaired to the "Swan and Royal" Hotel, where they were entertained to lunch, at which the mayor (Alderman C. T. Mitchell) presided.

The Mayor said he esteemed it a great privilege to have the honour, during his mayoralty, of welcoming to the ancient borough of Clitheroe so important a body of men as the Institution of Municipal Engineers. It was sometimes said of Clitheroe people, and it was pretty generally thought among more modern and go-ahead communities, that they were a backward and antiquated lot. He was afraid that, to some extent, they must plead guilty, whether it was creditable to them or not. They seemed content to jog along in a moderate sort of way—to "hasten slowly"—and he was afraid they had no desire to rival the feverish activities of some of the more modern towns. That did not mean, and he did not wish it to be inferred, that they were indifferent to progress. Clitheroe was a very old town, and the atmosphere of an old town conduced, perhaps, a little bit to sleepiness and sluggishness, and a desire for repose rather than activity. He pointed out that a 1d. rate in Clitheroe only produced about £180, and it was impossible to do a great deal on that. Unlike many towns, they were confronted with the "higgledy-piggledy" arrangements of their ancestors. They had to contend with narrow roads and corners that needed to be cut off, but he thought they were progressing and doing something to make the crooked straight and the rough places smooth. He trusted that as time went on they would have more of the comforts and conveniences of modern towns. At all events, they had always the satisfaction and pleasure of beautiful scenic surroundings, of which he trusted the party would see something during the afternoon. There was an old saying that Clitheroe was noted for its "Lime, Law and Latin." With regard to lime, they had seen something of it that morning, and in regard to law, they had had one or two lawyers who had left behind them an amount of something like six figures. As to Latin, they were in a short time going to lay the foundation-stone of a new grammar school, which had long been badly wanted. The school was for both boys and girls, and he trusted the secondary education of the town would receive an impetus through the new building, and that the children would thus have the same advantages as those possessed by children in other places. Alderman Mitchell went on to say he did not think they realised how much the country was indebted in its daily life to men like those who were present that day. The question of good roads, an adequate water supply, and the best sanitation touched them at every point, and he did not think that real and sufficient gratitude was given to the gentlemen of their profession who did so much for the community in that respect. He did not desire to encroach upon their time that afternoon, but he could not sit down without expressing acknowledgment on behalf of himself and the members of the corporation to Mr. Spackman for his hospitality. Their thanks were also due to Mr. Spackman for opening his works for inspection, and he was sure they had all been much interested in the visit to the Isis and the other works.

Mr. E. W. Platt (Salford) proposed that a hearty vote of thanks be accorded Mr. Spackman for the very kind manner in which he had received them, first at his works, and secondly at the luncheon. He did not think there was one subject or one material with which they, in their profession, had to deal more important than Portland cement. Therefore it was absolutely essential that every one of them should know definitely and thoroughly what was the best process of its manufacture. They all, in their student days, became familiar with the text-books on the methods of manufacture, and they owed great debts of gratitude to Grant and those men who had written so eloquently and thoroughly upon the material. Then, in their later days, they were thankful to the Associated Manufacturers of Portland Cement, and also to the Engineering Standards Committee for its excellent manual or standard specification for Portland cement. That day, however, they had had an opportunity of seeing the actual article in course of manufacture, and of having explained to them the proportions of which Portland cement was composed and the methods of testing it. Therefore each one of them would be more familiar than ever as to how to test Portland cement, and they would be better able to understand what the Standard Specification meant. He spoke with thankfulness of Mr. Spackman's kindness, because it was part of his (the speaker's) duty to test the cement supplied to the Salford Corporation. In the course of that duty, some years ago, he had a pleasant surprise. Two samples of Portland cement were submitted to him: one was very highly priced and the other very low, so low, in fact, that the committee who had advertised for contracts were doubtful about it. He did not know where the samples came from, but they were tested according to the specification, and the cheapest cement fulfilled the standard to a greater extent than the higher-priced article. He afterwards found that the cheap cement was manufactured by the Isis Cement Company. They would understand, therefore, how closely interested he was when he visited the works. Alluding to the mayor's remarks as to the town being antiquated, he did not think the corporation was antiquated, and he was absolutely certain that their method of manufacturing Portland cement was not antiquated. Alderman Mitchell had also said that the town was "higgledy-piggledy," but they had become so used to straight lines in towns that they hardly understood the picturesqueness of a curved line and all that an undulating road meant. At Clitheroe they had an opportunity of making their town beautiful. In the natural lime, which could be manufactured into marketable stone and Portland cement, they had the nucleus of manufacture, and, with the beautiful country around them they had an opportunity of practising the beneficent art of town planning. If they studied that matter thoroughly they would find their roads so picturesque that in the future they would not consider Clitheroe a "higgledy-piggledy" town.

Mr. J. W. Sunderland (Norden) seconded the proposition, and declared that the more they knew about cement the better they would be for it.

Dinner over, the members made a move for the free library, where, prior to boarding a couple of wagonettes which were to take them to West Bradford, *en route* for the waterworks, they were photographed. Heavily-laden clouds had by this time begun to sweep over Pendle Hill. Nevertheless, the journey commenced, and a most adventurous one it proved. The route was *viâ* Waddington, where the gardens, which at present are a blaze of colour, were greatly admired. Shortly after leaving the village the clouds began to discharge their contents. Those members of the party whose trust in the weather was so complete as to cause them to leave coats and umbrellas at home began to have serious misgivings, and, although there was a prospect of having an object-lesson as to how Clitheroe's water is obtained, they did not appear to view the prospect with equanimity. After leaving the wagonettes the lightning flashed and thunder rolled in a most businesslike manner, and as the storm began to gather strength the party made a dash for shelter. A farmhouse appeared as a haven of refuge, and a number were glad to seek shelter in the shippon. Rain then began to fall in torrents, and it continued for quite half an hour. The going subsequently was decidedly damp, and the uncomfortable conditions detracted somewhat from Mr. Bleazard's interesting description of Clitheroe's unique water supply. In fact, everybody was thankful when the wagonettes were reached.

On arriving at Clitheroe again an excellent tea was generously provided in the mayor's parlour by Alderman Mitchell.

Mr. Platt proposed a vote of thanks to his Worship, and he included the corporation in the resolution. He said they had been greatly interested in what they had seen that afternoon. It was certainly unique that a local authority should have control of a waterworks where the supply was derived entirely from springs. He did not know of any other authority that was in a similar position. Mr. Bleazard had also informed them that the waterworks were capable of extension at very little cost. In fact, all that would be needed would be to raise the levels of the present reservoirs, while there were other sources which had not yet been tapped. That, in itself, showed the great need for the conservation of water supply.

Mr. G. H. Hopkinson (Chorley) seconded the motion, which was cordially agreed to.

Alderman Hardacre replied on behalf of the corporation, and the mayor said it was a great pleasure to welcome them to the old borough.

Owing to the lateness of the hour, Mr. A. R. Bleazard, the borough surveyor, was only able formally to present the following paper, no discussion or comment being possible.

MUNICIPAL PROGRESS IN CLITHEROE.

By A. R. Bleazard.
Borough Surveyor.

Clitheroe is I think unique for the reason that it possesses a history which towns many times its size might envy. Though on the very fringe of the big cotton manufacturing centres, it is situated in one of the most beautiful districts of Lancashire or Yorkshire, and it is also a thriving business town, although one is at a loss as to whether it would be right to say that Clitheroe is more progressive as a business or a residential town.

It was known in early times as Clyderhowe, a name partly Ancient British, partly Saxon, and probably derived from Cled-dur (a hill by the water). It seems to have possessed considerable importance in the time of Henry I. A castle was built in it on an elevated limestone rock by Robert De Lacy the first, in the reign of Henry II. It played no important part in national affairs until it was held by the Royalists in the later stages of the Civil War. It was also dismantled in 1649, and is now represented only by the keep and old walls, which serve as a familiar landmark in the neighbourhood.

From 1348 to the Restoration the manor at Clitheroe belonged to the Duchy of Lancaster. It was given by Charles II. to General Monk, and belongs at the present time to the Duke of Buccleuch.

The town is a borough by prescription, and until the first Reform Act returned two members to Parliament. By that Act it was deprived of one of its members; and after the last Redistribution of Seats Act it became merged in the Clitheroe Division of the county (present member, A. Smith, Esq.).

The town was up to the passing of the Municipal Corporations Act, 1835, governed by two bailiffs and a court of inquiry in the nature of a common council. Since that Act it has been governed by the mayor, four aldermen and twelve councillors. It is possessed of fine regalia, including a grand silver-gilt mace presented to the borough by General Monk, with the arms of the out-burgesses or country gentlemen in and about Clitheroe engraved thereon.

This mace is borne before the mayor on special occasions. The rest of the regalia consists of a silver punch-bowl, 16½ in. high and 9 in. in diameter, on which is inscribed "The Drinking Cup for the Bailiffs and Burgesses of the ancient Borough of Clyderhowe, the gift of Sir Thos. Stringer, Knight Recorder of the borough and burgess for four Parliaments, 1681;" two other cups, and a large silver goblet, presented by Colonel Aspinall, of Standen Hall.

Modern Clitheroe, while retaining some reminders of the past in the shape of picturesque gabled houses, is a go-ahead town bent on making the most of its natural advantages, and on supplementing these, where desirable, with artificial improvements.

GENERAL STATISTICS.

The area of the borough is 2,385 acres; the number of inhabited houses at the last census was 2,895, and the population exactly 12,500; the rateable value is £49,942; the assessable value is £45,765. The district rate is 3s. 6d., and the poor rate (including county and elementary rate), 3s. 2d.; total rate, 6s. 8d. in the £.

SEWERAGE AND SEWAGE DISPOSAL.

Until recent years the drainage of the district was in a very defective condition, most of the sewers being stone-built culverts emptying into the brooks which run through the town. This state of things could not be allowed to continue, so the corporation applied and obtained Provisional Orders amounting to £22,000 for resewering the whole of the town, also for a sewage farm and purification works.

The farm is 75 acres in extent, of which about 70 acres are adapted for purification purposes. The whole of the land is under-drained with 12-in. main drains, and 6-in. and 4-in. subsidiary drains, the subsidiary drains being 4-ft. deep and 11 yds. apart, laid in herring-bone fashion, and conducted to inspection chambers. Most of the land has sufficient fall to allow the effluent to be, if necessary, again brought to the surface at the inspection chambers for a further filtration.

At first, when the works were started, it was considered that the only tanks necessary would be detritus tanks sufficient to take the heavy matter, but it was very soon found that this was not sufficient. New settling tanks were built by me in 1901, with a capacity of 130,000 gallons.

About two years ago the corporation entered into an agreement to treat the effluent from a proposed new dye and bleach works to be erected in the town. It was evident that the existing plant could not cope with these extensive works, and also the gradual conversion of the pail-closets to the water-carriage system, so I was instructed to prepare a scheme for remodelling and extending the present sewage works. These extensions consist of three new settling tanks, each 76 ft. by 53 ft. and 6 ft. deep, with a capacity of 450,000 gallons, four 80-ft. diameter sprinkler beds, 6 ft. deep, and seven sludge pits or drying beds, each 100 ft. long and 20 ft. wide.

The new tanks are being formed by earth embankments excavated from the site, which is good stiff clay. This, I find, is making a very satisfactory tank, and much cheaper than brick walls; the floor and sides afterwards will be concreted with 6 in. of cement concrete rendered to a smooth surface. The tanks are so constructed that the flow can be either continuous from one tank to the other or intermittent.

The sludge is conveyed by gravitation from the tanks to the drying beds by 12-in. earthenware pipes encased in concrete. Each bed is under-drained and covered with 2 ft. of clinker, with a layer of fine sand at the top, and the underdrains empty on the land for further filtration. Before entering the beds the sludge is treated to a 5 per cent of milk of lime. So far these beds have given us every satisfaction, and the sludge can be satisfactorily wheeled out in barrows. The most important point to bear in mind, I think, is that not more than 1 ft. of sludge in depth is put in each bed at one filling.

The sprinkler beds have not yet been commenced. This district being an agricultural district, all the land is used for grazing purposes, and for the year ending March 25, 1911, £192 12s. was received for cattle grazing on the farm, which is nearly £3 per acre. The sewage works is situated on the banks of the river Ribble, which at Clitheroe is a very fine fishing river, and under these circumstances the purification of the sewage at Clitheroe is at all times a responsible undertaking. I am glad to say the corporation have been alive to this, and have spared neither trouble nor expense to turn a satisfactory effluent into the river, and for the last two or three years the samples taken by the Ribble Joint Commission have invariably been among the *good*.

The main sewers vary from egg-shaped brick culverts, 3 ft. 6 in. by 2 ft. 4 in., to 12-in earthenware pipes. Practically all the main sewers have been relaid, and the work of connecting the houses to these new sewers is still being proceeded with. The water-carriage system is gradually replacing the old tub system of excreta removal. There were at the end of March last 2,049 closets and latrines on the water-carriage system, and 1,233 on the pail system. All the sewers are ventilated at each end, and periodically flushed. The length of the main sewers is about 12 miles.

WATERWORKS.

The inhabitants, long feeling the serious inconvenience of a defective water supply, determined in 1849 to call upon the the General Board of Health to apply the Public Health Act to this district, which request was complied with in the following year upon the report and recommendation of their inspector, Mr. B. H. Babbage. The corporation, however, preferred taking further advice as to the best means of doing this, and called to their aid the services of Mr. Park, of Preston, then engineer to the Preston waterworks, and subsequently those of Mr. McLandesborough, civil engineer, of Bradford. These steps were ultimately rendered nugatory by considerable opposition to the scheme.

In 1853 a company was formed for supplying the borough with water, and in the following Session of 1854 an Act of Parliament, to which there was some local opposition, was obtained for such purpose. Upon the Act being procured, the directors proceeded with the work of building a reservoir of 500,000 gallons capacity, with a 9-in. main and distributing pipes to the town.

In the year 1878 the waterworks was bought by the corporation and an Act of Parliament obtained for

further increasing the storage capacity and laying a new 9-in. water main in duplicate from the reservoir to the town. This reservoir was commenced in 1887, and has a storage capacity of 13,250 000 gallons.

Prior to the construction of the waterworks the supply of water for culinary purposes was procured principally from public and private wells, which sources yielded a supply of water abundant but unusually hard. The principal town's well (one of the softest) is 23 deg. of hardness, and the others range as high as 34 deg. The water supply from the waterworks is of exceptional quality, as the following report from the borough analyst will show:—

Borough Analyst's Report.

Borough Analyst's Laboratory,
166 Drake-street, Rochdale.

Dear Sir,

The sample of water received from you last week, which was collected just before entering the reservoir, is clear, bright, slightly alkaline, soft, and of great organic purity. Only traces of ammonia yielding compounds are present, nitrates are practically absent, chlorides are low, and oxygen absorption is negligible. Quantitative particulars are given below: —

	Grains per gallon.
Total solid matter	4·9
Loss on ignition of residue	0·5
Non-volatile mineral matter...	4·4
Combined chlorine	0·7
Chlorine calculated to common salt ...	1·15
	Parts per million.
"Free" or saline ammonia	0·02
Albuminoid ammonia	0·04
Oxygen absorbed in four hours	0·13
Total hardness (in Clark's degrees) ...	2·4 deg.
Temporary hardness (in Clark's degrees) ...	2·1 deg.
Permanent hardness (in Clark's degrees) ...	0·3 deg.

Nitrates and nitrites—absent. Lead and other poisonous metals—absent. It is difficult to imagine a more excellent town supply.

Yours faithfully,
E. STENHOUSE.

The water is procured from a number of copious springs that rise on the adjacent Grindleton Fells, the district being from 3 to 4 miles north of Clitheroe. The formation is of millstone grit, and from 560 to 1,300 ft. above ordnance datum. The minimum yield on any one day during the drought of last year was 450,000 gallons, and the maximum yield last January was 950,000 gallons. This supply is collected and conveyed from the springs to the reservoirs by means of earthenware conduits. The total length of water mains is 18 miles.

In order to ensure themselves that the purity of the water shall be maintained, the corporation determined to buy up all the land on which these springs were situated. During the last six years 632 acres of land have been purchased on the gathering grounds at a cost of £12,531 10s. 3d. The corporation supply several outside districts with water, including Grindleton, a portion of Sawley, West Bradford, and Mytton.

The water charges are 7½ per cent up to £20 rental, and 6 per cent over £20 rental. One bath and one water-closet for each house are free. The water for trade purposes is by meter at 1s. per 1000 gallons up to 100,000 gallons, and 3d. per 1,000 gallons over 100,000 gallons, paid quarterly.

The net water profits for the last ten years are:—

1902	£290
1903	311
1904	364
1905	210
1906	253
1907	262
1908	561
1909	659
1910	588
1911	630
	£4,128

HIGHWAYS.

The length of highways in the borough is 17 miles of which 11 miles are ordinary macadam, 2 miles wood and 4 miles tar-macadam. The whole of the ordinary macadam roads are now receiving a good coat of tar-macadam, or are gradually being converted to tar-macadam or pet-agitated roads.

Where the traffic is considerable I am of opinion that the best macadam road is the pitch-grouted. These are being formed in two coats, viz. The first coat is made of 2½-in. limestone, and within 1 in. of the finished surface and sprinkled over with boiling pitch. After being well rolled the top coat, consisting of 1 in. granite chippings, is put on which is well rolled and grouted flush with the boiling pitch and creosote, and afterwards covered with chippings.

PRIVATE STREETS.

All the private streets are being made up under the Private Street Works Act, 1892. Seventy have been made up during the last ten years. All the front private streets are made up with tarred limestone macadam, put on in two coats—*viz.*, a bottom coat of tarred stone, all sizes from 1 in. to 2 in.—4 in. thick laid is laid on a 8-in. foundation of limestone pitching, and, after being well rolled, is coated over with ½-in. tar chippings. The back private streets are all paved, the foundation being 8 in. of limestone pitching, and 6-in. setts from Wiswell quarries.

The footpaths in the centre of the town are all flagged with Yorkshire 3-in. flags. The footpaths on the outskirts of the town and several private streets are being formed of tarred-macadam, 2-in. thick, and have been very successful.

I have recently laid 1,700 super. yds. of granite-macadam with Rocmac as an experiment. This road cost 14·11d. per super. yd. Adjoining this length of road I also laid 3,800 super. yds. of water-bound granite-macadam road, costing 11·20d. per super. yd. The Rocmac has therefore cost 2·91d. per super. yd. extra. It is too early yet to give an opinion as to whether it has been worth the difference.

We are fortunate in Clitheroe in being able to obtain our tarred-macadam immediately on the doorstep, as it were, of the quarries; for this reason I can tar-macadamise our private streets at about 1s. 6d. per super. yd.

TAR-SPRAYING.

Clitheroe being on one of the main roads between Lancashire and the Lake District, the dust nuisance became unbearable. During last year we tar-sprayed 50,000 sq. yds. at an average cost of 1·12d. per yd. So satisfied have the corporation been with the result that we purchased a tar-spraying machine this year from Messrs. Llewellyn & James, Bristol, and we are now tar-spraying the whole of our macadamised roads in the borough where the gradient will permit.

STREET IMPROVEMENTS.

One of the disadvantages of an old town is narrow streets. Anyhow, during the last ten years there is no doubt the corporation have done some very good work in improving and widening several narrow streets, the most important being—

(1) Greenacre-street Improvement.—This street connects two main roads in the town, it was widened from 15 ft. to 36 ft. The widening necessitated taking down one house and building a concrete and girder bridge over the Mearley Brook, and cost £1,650.

(2) Wilkin-street Improvement.—This improvement was similar to Greenacre-street improvement. The roadway for a distance of 790 ft. was widened from 15 ft. to 36 ft. A concrete and girder bridge, with approach roads and retaining walls, was built over the Mearley Brook. This improvement cost £2,181.

(3) Waddington-road Improvement.—This roadway is one of the secondary main roads into Yorkshire, and for a distance of 1,020 ft. was widened from 20 ft. to 40 ft. wide, and cost £912.

(4) Roman Catholic cemetery improvement, £220.

(5) School-terrace improvement, £220.

(6) Taylor-street improvement, £315.

(7) King-street improvement, £308.

(8) Waterloo-road improvement, £351.

(9) Waddington-road improvement (near Crown Inn) £292.

(10) Railway-avenue improvement, £71.

(11) Victoria-street improvement, £108 14s.

(12) Wellgate improvement, £55.

(13) Wesley-lane improvement, £46.

GASWORKS.

The gasworks, like the waterworks, was originally formed by a company in 1836, and remained their property until 1878, when it was purchased by the corporation. Since that time the gasworks has made enormous strides, as the following figures will show: Amount of gas produced in 1894, 20,000,000 cub. ft. amount of gas produced in 1912, 74,000,000 cub. ft.

During the past four years the gasworks has practically been rebuilt. New retort-houses, containing nine sets of bed, eight retorts in each bed, new coal stores (with conveying and elevating plant), new purifying plant and super-structure, new station meter-house and meters have been built, and the capacity

almost doubled. The whole of these extensions at the gasworks were carried out and superintended by Mr. R. Barrett, gas engineer.

The price of gas is 2s. 6d. per 1,000 ft. nett, with an extra charge of only 1½d. per 1,000 ft. for penny-in-the-slot meters. The following are the nett profits at the gasworks for the last ten years:—

1902	£858
1903	1,496
1904	1,093
1905	1,141
1906	1,750
1907	1,992

PUBLIC ABATTOIRS.

In 1906 powers were obtained to erect seven new public abattoirs, and at present four have been erected, at a cost of £2,076. They consist of a lairage, slaughter-house and cooling-room, with the necessary boundary walls and paved yards. Each lairage is 17 ft. 6 in. by 14 ft.; slaughter-house, 17 ft. 6 in. by 13 ft. 6 in.; and cooling-room, 17 ft. 6 in. by 7 ft. 6 in. Each slaughter-house is provided with the necessary hoisting apparatus, and overhead runners for conveying the carcases from the slaughter-house to the cooling-room. The rent of the slaughter-houses are as follows:—

Private slaughter-houses for cattle and sheep, 10s. per week; but two, three or four butchers may join at one house on the understanding that each person is a direct tenant of the corporation on a quarterly tenancy.

Public slaughter-houses for cattle, sheep and pigs, 2s. per week for each butcher, each person to be a direct tenant of the corporation on a quarterly tenancy. All tenants to pay rates, gas and water charges. Occasional use of public slaughter-houses to be at the rate of 2s. per week or part of a week for each butcher.

PUBLIC LIBRARY.

A new free library and reading-room was erected in 1906 [illegible] wards when Mr. Carnegie gave £3,000 and [illegible] the old town hall. The free library was opened in 1870, and until 1906 [illegible] the corporation allowed the Free Library Committee the use of the [illegible] of the town hall.

The number of books is almost 9,000 volumes. The library is supported by a 1d. rate, producing £174. Last year 36,500 volumes were issued to the public. The librarian is Mr. J. W. Hayhurst, who has for thirty years taken a great interest in the work.

FIRE BRIGADE.

The fire brigade is a voluntary one, consisting of eighteen members, who are paid according to the following scale: [illegible] at the fire, 1s. per hour afterwards; 1s. for each drill.

The equipment consists of a steam fire engine, manual, fire-escape, hose cart, and all appliances necessary.

The corporation have been considering for some time the erection of a new fire station, and the efficiency of the brigade under their present circumstances reflects great [illegible] on the superintendent, Mr. J. Taylor.

SCHOOLS.

There are five elementary schools in the borough, of which one is a council school and the remaining four are voluntary schools. The council are contemplating erecting at least one, if not two, new schools, and a sub-committee are at present selecting the most suitable sites for these proposed new elementary schools, and I have been instructed to get out plans for them.

A new secondary school is also being erected by the Lancashire County Council to take the place of the old Grammar School, costing about £20,000, including the site.

PARKS.

The corporation were fortunate in being the owners of 6 acres of land adjoining the river Ribble. This has been made into a park, and is greatly appreciated by the public. It has been laid out with walks, and bathing facilities have been provided for both male and female.

Recently an extra strip of land adjoining has been leased to the corporation, and a new entrance is being formed into the park.

At the last council meeting the ex-mayor, Alderman J. T. Whipp, very generously offered to the corporation 4 acres of land for a park at the south-west end of the borough.

HOUSING AND TOWN PLANNING.

The corporation very recently took advantage of the powers under the Housing and Town Planning Act of 1909. During last year 222 houses were inspected and notices served on the owners to remedy any defects. A scheme is [illegible] for the erection of workmen's dwellings.

I think that I have given a fair outline of municipal progress in the borough of Clitheroe, and I feel confident that, although we may not have advanced at a very rapid pace, improvements have been made of a solid and substantial nature. We are very hopeful of the future, and with the introduction of a new industry, which undoubtedly will commence before long, we hope to make still further progress, comparing favourably with towns of similar size to Clitheroe.

Owing to the lack of time the business meeting in the council chamber was very brief. Mr. Platt took the chair and read a letter from Mr. Bowes, resigning the chairmanship of the district. Mr. Platt proposed the election of Mr. Bleazard to the vacant position, and this was heartily carried.

Mr. Bleazard then took the chair and briefly returned thanks. Mr. J. W. Gleave (Heywood) was elected honorary district secretary, and the retiring officers were thanked for their services.

New Open Space for Croydon.—An anonymous donor has given to Croydon land covering 3½ acres at Pollard's-hill, Norbury, to be preserved as an open space for the use of the inhabitants, together with a sum of £250 to meet the cost of fencing.

Coroner's Court and Mortuary for Southwark.—It is proposed by the London County Council to apply to Parliament for authority to enable Southwark Borough Council to erect a coroner's court and mortuary on a site in St. George's-churchyard, Southwark.

Crystal Palace School of Engineering.—Sir Maurice Fitzmaurice (chief engineer to the London County Council) on Monday awarded the certificates won during the summer term by the students at the Crystal Palace School of Practical Engineering. In the course of an address Sir Maurice stated that the school had maintained its reputation for many years. He said [illegible] the [illegible] staff, and their work [illegible] satisfactory.

Guildford's Old Cottages.—Arrangements have been made between Surrey County Council and the Corporation of Guildford by which the proposed widening of Farnham-road will not be proceeded with, and the county council will contribute £3,000 towards an improvement, estimated to cost £10,286, at the Ram Corner in High-street. Under the first proposal several picturesque old cottages were to be pulled down, when the National Trust and other societies protested against their destruction as an act of vandalism.

Problems in Engineering.*—This reprint from the popular students' section of our contemporary consists chiefly of questions that have been set at the examinations of the Institution of Civil Engineers and of the Institution of Municipal and County Engineers. There is no index to the work, but the matter is classified under the heads of Mechanics and Hydrostatics, Strength and Elasticity of Materials, Theory of Structures, Surveying and Levelling, Water Supply and Hydraulics, Sewerage, Sewage Disposal, Road Making and Tramways, Building Construction and Materials, Law, and Miscellaneous. This book is calculated to be of considerable use to students in these subjects, but it would have been an advantage if the source of the questions could have been stated. The answers have in general been given rather more fully than would be the case at an examination, with the object of explaining the principles to a student without his having to refer to a text-book for them. The price brings the work within the reach of all students, and there is so much useful matter compressed into a small space that even the best-prepared candidate cannot afford to be without it.—*Sanitary Record.*

* "Problems in Engineering, with Solutions." Being Questions and Answers reprinted from the Associate and Student Sections of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER. First Series, 1909-10. Edited by Sidney G. Lister, A.M.Inst.C.E. Price 5s. net. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for July has been awarded to

Mr. W. Duff.
Town Hall,
Dudley,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

260. Refuse Disposal.—Where there is no system of sewers in a district, what are the best methods of collecting, removing and disposing of the fluid and solid refuse from the community?

262. Wood Paving.—What contour should be given to a wood-paved (soft wood) road 60 ft. in width? Describe the best method to adopt in fixing the screeds. (A. B.)

263. Floor Construction.—Give sections showing clearly the construction of a double floor and a framed floor respectively. ("Junior.")

264. Concrete Beam.—A concrete beam reinforced with steel rods is to be designed to carry a distributed load of 20 tons. The span is 15 ft. Show by calculations what size of beam you would use—the method and formulæ to be as simple and short as possible. ("Greenland Farm.")

265. Strength of Shafting.—A 10-in. shaft has a 4-in hole run through it; what fraction of its weight is removed? To what extent is its strength in resisting torsion affected?

REPLIES TO QUESTIONS.

261. Deflection of Beams.—If two precisely similar beams of rectangular section, one of cast iron and the other of wrought iron, were laid across the same span and loaded with the same load (within the elastic limit), what would be the relative deflections of the two beams?

The general form of the equation for the deflection of any beam loaded within the elastic limit is

$$D = C \frac{WL^3}{EI}$$

where D is the deflection,
W is the total load on the beam,
L is the clear span,
E is the modulus of elasticity of the material composing the beam,
I is the moment of inertia of the cross section of the beam,
and C is a fraction which is dependent for its value upon
(*a*) the manner in which the beam is supported, i.e., whether it has ends "free," "fixed" or "part fixed,"
and (*b*) the manner in which the beam is loaded, i.e., whether it be a concentrated or distributed weight.

The units employed must be consistent—*e.g.*, if E be in lbs./sq.-in., then W must be in lbs., and I and L in inch units.

Let D_1 and D_2 represent the deflections of two similar beams one of C.I. and one W.I. when similarly loaded and fixed.

Let E_1 and E_2 represent the respective values of the moduli of elasticity of these materials.

Then

$$D_1 = C \frac{WL^3}{E_1 I}$$

and

$$D_2 = C \frac{WL^3}{E_2 I}$$

$$\therefore \frac{D_1}{D_2} = \frac{C \frac{WL^3}{E_1 I}}{C \frac{WL^3}{E_2 I}} = \frac{E_2}{E_1}$$

Since other factors are equal—*i.e.*, the deflections of two similar and equal beams as regards shape, size, fixing and loading, but of different materials are inversely as the moduli of elasticity of those materials.

Taking E for C.I. as 14,000,000 lb./sq.-in.
and E for W.I. as 29,000,000 lb. sq-in.

We obtain from a direct application of the above the result that the

Deflection of the C.I. beam : Deflection of the W.I. beam.

:: 29 : 14

(A. J. S. P.)

Some Notes on Reinforced Concrete.

Concrete has been extensively used as a building material for ages, its use being common in ancient Rome, for instance, but its economic application was limited to purposes where it was subject only to compressive stresses, until forty or fifty years ago. Being practically ten times as strong in compression as in tension it is wasteful when used *alone* to make beams, &c., on account of the bulk needed on the tension side and the space occupied. Steel, however, is so much stronger in tension than concrete that a small proportion of it, suitably introduced into the parts of a beam or slab which are subject to tensile stresses, will balance the compressive forces exerted on the other side of the neutral axis. A construction which utilises the most important properties of each of the two materials steel and concrete is arrived at by suitable combination and disposition of the two across the sections of a structure or structural member. This principle has led to the several forms of "Reinforced Concrete Construction," many of which have met with considerable commercial success.

Many fine architectural and constructional feats have resulted in all parts of the world from applications of these systems, among which the "Kahn," the "Expanded Metal," and the "Indented Steel Bar" methods are as well known as any. It is sufficient to say that the durability of such structures, the economy with which they have been erected, and the ease of construction point to an almost unlimited field in the future for applications of Reinforced or Ferro Concrete Systems.

The *expansion and contraction* of steel and concrete under varying temperatures may be taken as equal for all practical purposes, this being an important fact from the engineer's point of view, as induced stresses are thereby eliminated. As a matter of fact the coefficient of expansion for steel is 0·00000676, and for good hard concrete 0·00000655, and high carbon steels (too brittle) are avoided in preference for high quality mild steel of ultimate tenacity not less than 60,000 lb. per square inch. Clearly the capacity of a reinforced concrete member for resisting tension is dependent entirely upon (1) the cross section of the combined metallic bars or pieces introduced and their quality: (2) the grip or adhesion of the concrete to the steel, which allows of the transmission of tension from the concrete to the steel, so preventing failure of the concrete.

The provision, then, of a sufficient mechanical bond between the two materials is of primary importance. Where plain rods or bars are used many devices have been employed by engineers, such as splitting or bending the bars at their ends to obtain *anchorage*, and in view of the fact that the adhesion may be easily destroyed by the mere small contraction of reinforcing bars when under stress, this is very necessary. The adhesion is purely mechanical friction, in other words, and if the bar is sufficiently pulled, it will slip in the concrete owing to its contraction in area. Again the shocks and vibrations inseparable from the average structure may cause this failure of bond. The use of smooth bars is thus risky, though cheaper than the forms of "expanded metal" or "indented" or otherwise deformed bars introduced with considerable success to secure a depend-

able mechanical and cross bond. It must be stated that these more modern methods of reinforcing aim at and secure a much more *continuous* bond than can any bending or splitting of round bars (where the grip can be obtained only around the deformed parts). With smooth bars a maximum tensile stress in the steel of about 8 tons per square inch is advisable, and in some countries the use of bars designed to provide a continuous mechanical bond is enforced if a high tensile stress is allowed.

The Elastic Limit of the steel employed is the prime factor which determines its value for reinforcement, and *not* the ultimate stress. For when the elastic limit is exceeded considerable contraction of the bars will inevitably occur, causing moisture to creep in and cause failure by corrosion of the iron sooner or later.

A material of relatively high elastic limit is therefore most suitable, and a value of over 50,000 lbs./sq.-in. (about 23½ tons/sq.-in.) applies to the rolled "indented steel bars," with an ultimate strength of over 42 tons/sq.-in., as against an elastic limit of 15 tons sq.-in., and an ultimate strength of 30 tons sq.-in. for the ordinary plain bars employed.

It is also advantageous to employ a deformed bar of unvarying net cross section (though perhaps of varying form) throughout the length, so that no metal shall be wasted, since "*the strength of a chain is that of its weakest link*," *i.e.*, the useful strength of a bar is fixed by its minimum section.

There is a critical angle of friction between steel and concrete beyond which angle the projections on deformed or indented bars must not be set, as they then begin to exert a wedge-like bursting action. The faces of the projections must make with the centre line of the bar an angle *greater than* this critical or friction angle so that, no matter how great the tension on the bar, this bursting tendency shall be non-existent. In order to provide for the resistance of combined shear and tension it should be possible to bend the bars easily through a large angle, so that they can be set for part of their length in the direction enabling them best to take up and resist the shear existing.

A large ultimate elongation (15 per cent to 17 per cent on an 8-inch gauge length) and the ability to bend at a small radius *cold* without cracking is here necessary. Large bars may need heating before bending. In considering *shear* members, it is well to note that they are of short length usually, such as the full depth of a beam, and that the provision of a good mechanical bond in that short length is necessary to avoid the bar pulling out of the steel (due to imperfect adhesion) before the full strength of the metal has been developed. When we consider that a length of anchorage equal to not less than 150 times the diameter of the bar is reckoned necessary in a round bar, the advantages of deformed bars to secure complete adhesion within a short length become apparent.

SOME RECENT PUBLICATIONS.*

THE COMING OF PETROLEUM. Price 2s. 6d. nett. London: Curtis, Gardner & Co., Limited.

An idea of the vastness of the petroleum industry may be gained from figures in this interesting publication as to the present output of oil in the various producing countries. The total is no less than 43,000,000 metric tons, of which the United States contributes over 63 per cent and Russia nearly 22 per cent. The information in the book appears to have been carefully collected, and is presented in a form which will enable readers better to follow the reports and statements of those associated with the industry.

Part xxxvii. of the London County Council's series of booklets in which accounts are given of the work of indicating houses of historical interest in London has just been published. The price of the booklet is 1d. We have also to acknowledge copies of the "Statistical Abstract for London, 1911-12" (price 1s.), and "London Debt, 1910-11" (price 4d.), the latter being a return showing, in respect of the various London local authorities, the gross and nett debt outstanding at the end of the period which it covers, and the annual charge on the rates in that year, together with an analysis of the total nett debt of London.

The remarkable progress of the Royal Colonial Institute is indicated by the Year Book of that body for the present year. The institute has now nearly 6,000 Fellows, and its growing importance, the widening of its scope, and the increase of its membership have necessitated a great extension of its premises in Northumberland-avenue. Here is established a club house where persons from all parts of the Empire are able to exchange experiences, and have the advantage of an information bureau, the value of which may be gauged by the statement in the Year Book that its admirable library contains nearly 90,000 volumes and pamphlets, not one of which does not relate to the objects of the institute.

Change of Address.—The Fernden Fencing Company announce that in future their only address will be Bell Vale, Haslemere, Surrey.

India's New Capital.—It was announced in the House of Commons on Tuesday that the Government buildings of Delhi, the new Capital of India, are to be built in the Renaissance style, at a cost of £4,000,000.

London's Tramways.—In the proceedings before the Select Committee of the House of Lords considering a Bill of the London County Council for tramway extension, it was stated that of the 156 miles of tramways in the county of London 148½ were worked by the London County Council. Of that number 130 miles are worked electrically, and there still remain 10 miles which are worked by horse power.

Institution of Civil Engineers: A Legacy.—Under the will of the late Sir James Inglis, a former president of the Institution of Civil Engineers, the institution has just received a legacy of £5,000, to be applied to its new building which is now in course of erection in Great George-street, Westminster. This legacy testifies to the marked interest which Sir James Inglis took in the scheme for the rebuilding of the institution, towards the cost of which he had also during his lifetime, contributed liberally—regarding the occasion as an opportunity to promote the centralisation, and thereby the strength, of civil engineering interests throughout the British Empire.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

Law Notes.

Edited by J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion queriers are requested to use distinctive words as noms de plume. *The letter X, combinations such as* X.Y.Z., *and words such as* "engineer" *and* "surveyor," *should never be used.*

Laying Out a New Street.—"H." writes: "The owner of a house standing upon a large plot of ground is desirous of building another house on the same plot, at the rear of the present house, in the position shown on the enclosed block plan. Between the points A and B an occupation road 10 ft. wide has been reserved,

and forms the only means of approach. I shall be glad to have your opinion as to whether: (*a*) This proposal involves the creation of a new street between the points A and B, and, if so, (*b*) sec. 5 (sub-sections 1 to 3) of the enclosed by-laws is applicable; (*c*) can the intention to build where shown be vetoed on other grounds?"

[EXTRACT FROM BY-LAWS WITH RESPECT TO THE LEVEL, WIDTH, AND CONSTRUCTION OF NEW STREETS.]

Width of street.

5. (1) Every person who shall lay out or construct a new street which shall be intended for use as a carriage road shall so lay out such street that the width thereof shall be 36 ft. at the least.

Streets exceeding 100ft. in length.

(2) Every person who shall construct a new street which shall exceed 100 ft. in length shall construct such street for use as a carriage road, and shall as regards such street comply with the requirements of every by-law relating to a new street intended for use as a carriage road.

(3) Provided always that this by-law shall not apply in any case where a new street shall not be intended to form the principal approach or means of access to any building.

Width of street not intended for carriage traffic.

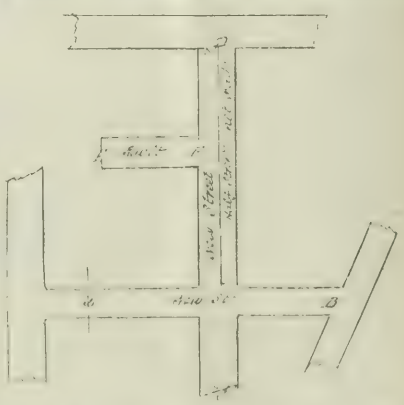
(4) Every person who shall lay out or construct a new street which shall be intended to form the principal approach or means of access to any building but shall be intended for use otherwise than as a carriage road, and shall not exceed in length 100 ft., shall so lay out such street that the width thereof shall be 24 ft. at the least.

Secondary means of access.

(7) Every person who shall lay out or construct a new street which shall not be intended to form the principal approach or means of access to any building, but shall be intended for use as a secondary means of access to any premises for the purpose of removal therefrom of house refuse and other matters, shall so lay out such street that the width thereof shall be 16 ft. at the least, provided that if such new street shall not exceed in length 120 ft., the width thereof shall be 10 ft. at the least. Provided that where such street shall be of a less width than 16 ft., and shall exceed 100 ft. in length, such person shall provide that each end of such street shall be open from the ground upwards to the full width of such street, and shall communicate with a street of not less width than such street, or shall so construct such street that at the end farthest from the entrance thereto there shall be a space forming part of such street free from any erection thereon above the level of the ground of an extent not less than 30 sq. yds., and of a width not less in any part than 16 ft.

(*a*) In my opinion the erection of the proposed house does not in itself constitute the laying out or construction of a new street. (*b*) These provisions apply only if proven a new street is being laid out or constructed. (*c*) Not unless the proposed building contravenes any of the by-laws.

Private Street Works: Work already done by Owners: Apportionment.—"L. Q." writes: I should be extremely obliged if you would give me your opinion as to whether I have apportioned in a correct manner the making up of three streets in this district (as sketch). I apportioned the work done according to frontage, and the total amount expended on each street. I made a survey and prepared plan, sections, specification and provisional estimates and quantities, and when these were completed notices were served on owners—twenty-one days. No objections were made by the owners during that period. A contract for the work was let, the contractor in this case being one of the private property owners. The work is completed and paid for, and there are no extras or deductions from the contract amount.



Notices of apportionment of expenses were served on the owners under Form 257. The notices stipulate that a period of three months is allowed, during which time objection to the apportionment may be made. At the time the plans, &c., were made I included only in the quantities and specification the work required to be done to complete the making up of the streets. In the specification a clause was inserted that "A copy of the bill of quantities, schedule of prices, and form of tender will be supplied to intending contractors. These quantities are taken out with great care, but the contractor must verify their accuracy for himself should he think it necessary." Two owners have objected to the apportionment the contractor and one of my council. One

owner objects because he says the whole of the half-roads and the footpaths belonging to him were formed and rough pitched, and the kerb and channelling all fixed in every case, before the notices to make up the streets were sent out. This is not quite correct; portions of these streets were made, but not completed, and only kerb or channel was specified in the quantities to be provided where there was no channel in the street, and where old channel was defective this was specified to be reinstated. In the street C to D kerb and channel were laid on the objecting owner's side, and the other half of the street, belonging to another owner, was not made at all or kerbed and channelled. The objecting owner thinks I ought to make him an allowance for the work he had done previous to the contract being let. This I cannot do in any case, because this owner receives the benefit of the entire street being completed as a whole, and all the owners are joint users of the street, and the street could not be taken over by the council until complete. On August 14th the time expires under the notice of apportionment of expenses for disputing the apportionments, and two other owners have time yet in which to dispute the apportionment. The point in dispute appears to be: An owner has made part of a street opposite his premises, the street being then left in an unfinished state for several years; the owner then did further work at different times on this private street. The council, after receiving complaints of the bad state of the street, decided to have plans, &c., made for this making up of the street under sec. 150 of the Public Health Act. Could this owner make any claim for allowance for work done in the street previously to the contract being let?

In my opinion an owner cannot object to an apportionment under sec. 150 of the Public Health Act, 1875, on the ground that no allowance has been made to him for work already done to the street. The council have no power under this Act to make any such allowance, even if they were willing to do so.

By-Laws: Air Space.—"Health Officer" writes: I should be glad if you would give your opinion of the correct interpretation of by-law 54 (copy of by-laws and sketch forwarded). The contention of a speculative builder in this district is that a wash-house for the joint use of two houses occupied by separate tenants can be erected a distance of 10 ft. from the rear of the dwelling-houses. The height of the houses in question is 25 ft. measured in the manner defined in the by-law, and I contend that there should be provided in the rear of such dwelling-houses an open space of a width of 20 ft., and this open space must belong exclusively to each separate house, and extend laterally throughout the entire width of each house, and to be free from any erection thereon above the level of the ground, except a water-closet, earth-closet or privy, and an ashpit. I further contend that the word "erection" applies to any wall or timber fence, and not merely to a building. An exception is made to a fence or wall intended solely to divide each yard or air space from the adjoining space. The reading of the by-law in this district in the past has been to the effect that "the height of such building" referred to the appurtenant building—*e.g.*, wash-house—and not to the dwelling-house. Personally, I feel confident my own interpretation of the by-law is the correct one, and the illustrations on p. 128 of Knight's "Annotated Model By-laws" support my view. No wonder houses are overcrowded into a small area, with this local reading of the by-law, which my predecessor has upheld for the past fifteen years.

The by-law is absolutely clear and definite. The height of the houses being 25 ft., the distance across the open space to the boundary of the opposite premises must be 20 ft., and that 20 ft. must be free from any erection (except a wall, &c., as specified). A wash-house is not one of the excepted erections and cannot therefore be erected within the 20 ft. The suggestion that "the height of such building" refers to the height of the washhouse or other outbuilding is in my opinion preposterous and astounding. Such a reading would make nonsense of the by-law. "Such building" of course means the "new domestic building" mentioned at the beginning of the by-law, and in the rear of which the open space is to be provided. "Erection," in my opinion, includes a wall and a timber fence.

By-Laws: Air Space.—"W. H. R." writes: Will you please say if it is lawful for a person to erect a large wooden shed on wheels, or otherwise, in the rear space provided in connection with a dwelling-house in such a manner that the shed lies within the lateral space referred to in the by-law No. 58 (copy of by-laws forwarded)?

The object of this by-law is to provide a sufficiency of space about buildings to secure a free circulation of air. Bearing this in mind, I think any structure (whether on wheels or not) which would interfere with or militate against that object would be held to be an "erection" within the meaning of the by-law. In my opinion, therefore, the erection of a large wooden shed (whether on wheels or otherwise) on the open space provided would be a contravention of the by-law.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Ashton-in-Makerfield U.D.C. (July 10th. Mr. A. W. Bergmore).—£2,350 for the purposes of sewerage and sewage disposal. Mr. J. Stephens (Messrs. Stephens, Banks & Fairclough, consulting engineers) stated that the method of treating the sewage at the existing works near Millingford Bridge was by means of first, second and third contact beds, which were insufficient and unsuitable for efficient treatment. It was proposed to abandon the use of those beds. The new works were designed with the object of reconstructing the subsided sewer in Princess-road, and providing for the existing and further subsidence by a pumping station and for the efficient treatment of the sewage from the Princess-road, Bryn-road and Golborne-road areas in detritus, storm stand-by, and precipitation tanks, and in percolating filters and humus tanks, and by the treatment of the sludge by Dr. Grossman's process.

Bournemouth T.C. (July 10th. Mr. H. R. Hooper).—£12,170 for the erection of law courts in Stafford-road.—The borough engineer, Mr. F. W. Lacey, stated that the corporation were doing the whole of the work, and the Home Office were paying a certain proportion. The loan did not include the cost of the furnishing of the courts, for which the Home Office were responsible. The inspector suggested that it would be better to leave out of the amount asked for, the cost of the furniture and fittings, amounting to £2,405, which could be the subject of a further application to the board upon the basis of amended estimates and provisionally accepted tenders.

Chorley T.C. (July 23rd. Mr. R. G. Hetherington).—This was a renewed application for sanction to borrow money for the purpose of providing a sewerage scheme and outfall works for the Bolton-road and Red-bank districts. The scheme was strongly opposed by landowners and property owners in the district.

Clones (Co. Monaghan) U.D.C. (July 24th. Mr. A. D. Peace). £2,500 for the carrying out of a supplementary sewerage scheme, and £1,750 for the erection of a new working gas lodging-houses on the Cattle Fair green, the site being the property of the council. The inspector stated that he had received no objection to either scheme.

Exeter T.C. (July 16th. Mr. W. H. Collin).—£8,847 under the housing order; for sanction to borrow £2,039 for the purchase of the Exeter Nursery, St. Thomas, for the erection of houses, and to be relieved from the purchase of certain other lands under the order.—The town clerk stated that the corporation desired to be relieved from the necessity of utilising the whole of the site involved by the Blackboy-road improvement in providing dwellings for those of the working classes who were displaced by the scheme proposed. The city was growing rapidly in the direction of Blackboy-road, and the site would be a most valuable one for business premises, and was more suitable for such premises than private cottages, especially having regard to the fact that the policy of the council now in regard to the erection of working-men's dwellings was to provide gardens to the houses. It found practicable, a number of cottages might be erected at the rear of a range of business premises, but the council had been unable to find a site in the vicinity which they could purchase at a reasonable price for the erection of houses to accommodate residents displaced. The council, however, had decided upon a site known as the Exeter Nursery, where workmen's cottages could be put up at a reasonable cost and gardens provided. Mr. T. Moulding, city surveyor, said that the site of the nursery was below the sewer of a neighbouring road but it would not be drained by this sewer. There had been trouble with the sewers in St. Thomas at time of flood. If a builder applied to the council for sanction to erect houses on this site he should not object.

Featherstone U.D.C. (July 25th. Mr. Courtenay Clifton). £3,740 for the purpose of erecting workmen's dwellings.—The clerk, Mr. J. A. Haigh, stated that the council proposed to erect 159 houses at a uniform weekly rental of 6s. each. After an allowance for "empties," the estimated income would be £2,433 12s. The loan would be at the rate of 3¼ per cent. interest, and the repayment in regard to land would be spread over a sixty years, and as to

years as to the buildings. The surveyor, Mr. S. Chesney, explained the scheme. Each house, he said, would have a living-room, scullery (with bath), accommodation for stores, three bed-rooms and a garden. No private builder had provided better houses for 6s. a week.

Ilford U.D.C. (July 17th. Major C. E. Norton).—£1,057 for the purchase of land adjoining Suffolk-road, Seven Kings, as a site for a dust destructor.—Mr. H. Shaw, surveyor and engineer to the council, expressed the opinion that the price which the council proposed to pay—*viz.*, £325 per acre—was reasonable. The proposed destructor was of Horsfall pattern, and the site was a ¼-mile radius from the nearest buildings.

Ipswich T.C. (July 11th. Mr. F. O. Stanford).—£1,300 for the widening and improvement of Bramford-lane, Greyfriars-road, and the Seven Arches Bridge, London-road.—Mr. Will Bantoft, town clerk, explained that the work had been done at Greyfriars-road, where Messrs. Burton's works, having been reconstructed after the fire, gave them the opportunity of making the improvement. At Bramford-lane, in the vicinity of which many houses had lately been built, they had so far only set the fences back. In London-road there were two bridges, of which Handford Bridge had been widened about twenty years ago, the cost having been defrayed by loan. Since the bridge was widened the Education Committee and the Government inspector had called attention to the necessity for widening the Seven Arches Bridge, near which there was a public school. As this was a main highway from London to Ipswich and Yarmouth, and a great deal of motor traffic passed through, it was obvious that the bridge was very dangerous to children. Mr. E. Buckham, borough surveyor, stated with regard to the Seven Arches Bridge, that two-thirds of the work was now done. The palisading and parapet was not yet in hand. There was an excellent foundation. When completed the bridge would be widened from 18 ft. 3 in. to 35 ft. between the parapets, the same width as Handford Bridge.

Ludlow T.C. (July 26th. Mr. W. O. E. Meade-King).—£4,300 for the purchase and laying out of land adjoining Clee Hill-road, in the parish of East Hamlet, as a burial ground.—Mr. J. A. Spreckley, borough surveyor, said it was proposed to lay out about half the ground for 2,890 graves.

Rhymney U.D.C. (July 25th. Mr. W. H. Collin).—£6,800 for the erection of thirty houses in the Lower Rhymney district.—The evidence showed that in consequence of the council's persistency in abolishing the back-to-back dwellings and cellar tenements and making each a through house, and the Rhymney Iron Company's consistent efforts to comply with the mandate, there was now a shortage of dwellings, notwithstanding the large number of houses that had been built by private enterprise, clubs, &c. Mr. W. Beddoe Rees, who appeared for the Welsh Garden City Syndicate, said his clients were prepared to erect thirty houses with an equal number for the council, and in consideration of the construction of sixty, the Rhymney Iron Company, who were the landowners, had given the council ½ acre of land adjacent to the dwellings proposed to be erected. It was stated that the houses would be self-supporting. The cost of erection would fall upon the tenants, and not the ratepayers. The average cost per house for buildings, road construction, sewers, &c., would be £215 per house.

Rotherham R.D.C. (July 16th. Mr. A. W. Brightmore). £14,027 for the purpose of providing a water supply for the parishes of Bramley, Brampton-en-le-Morthen, Hooton Levitt, Laughton-en-le-Morthen, Maltby, Ravenfield, Ulley, and Wickersley.—Mr. J. H. Pickford, from the office of Messrs. Oxley & Coward, clerks to the council, stated that the district, because of colliery developments, was becoming thickly populated, and the parishes were for the most part dependent upon shallow wells for their water supply, making it desirable that the scheme should go forward. The supply of water from Sheffield was well known to be pure and wholesome, and a provisional agreement had been entered into, the price to be paid to Sheffield being 9d. per 1,000 gallons. Mr. B. Hey, sanitary engineer, also gave evidence.

Scarborough T.C. (July 18th. Mr. F. H. Tulloch).—£325 for the widening of Somerset-terrace.—The borough engineer, Mr. H. W. Smith, stated that this improvement was the cheapest the corporation had carried out for some time.

Sunderland R.D.C. (July 24th. Dr. Farrar).—£6,000 for the purpose of extending their hospital.—Mr. J. C. Wilson, clerk to the council, said it was proposed to build a new block to contain twelve beds for the treatment of diphtheria, to provide accommodation for six new beds in the scarlet fever block, and to make additions and improvements to the existing building. There was no opposition.

APPLICATIONS FOR LOANS.

Bristol T.C.—£2,678 for road widenings.

Devonport T.C.—£400 for works of paving.

Hinckley U.D.C.—£1,100 for laying out a recreation ground and the construction of a new road.

Loughborough T.C.—£1,303 for street improvement works.

Mirfield U.D.C.—£3,800 for sewage disposal works.

Southampton T.C.—£300 for a motor fire escape van, and £475 for superheaters and steel mains.

West Sussex C.C.—£3,540 for the purchase of convertible tractors and steam rollers.

LOANS SANCTIONED.

Bedwellty U.D.C.—£12,682 for a housing scheme near Pengam.

Billericay R.D.C.—£2,280 for erecting workmen's dwellings at Great Bursted.

Burnley R.D.C.—£5,200 for works of sewerage and sewage disposal at Foulridge.

Coleraine R.D.C.—£8,520 for workmen's dwellings.

Evesham R.D.C.—£10,025 for building sixty cottages.

Hull T.C.—£7,822 for the provision of an infants' school.

Kettering U.D.C.—£2,600 for the erection of an art gallery.

Llanelly U.D.C.—£5,100 for laying out Park Howard.

Loughrea U.D.C.—£1,900 for an improvement scheme.

Luton T.C.—£4,615 for a new boys' department at Hitchen-road school.

Mansfield T.C.—£400 for electricity extensions, and £200 for a road improvement.

Oxfordshire C.C.—£2,300 for a new school at Sonning Common.

West Bromwich T.C.—£4,500 for removing the tramway poles from the centre to the side of the road.

West Sussex C.C.—£15,000 for main road reconstructions.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Aberdeen £5,800, Boston £7,370; housing and town planning—Rhondda; refuse collection and disposal—Melton Mowbray; roads and materials—Croydon £20,600, Lancashire £15,000; sewerage and sewage disposal—Camborne £25,000; Hinckley £5,000, Middleton £25,000; water, gas and electricity—Nottingham £17,000.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Aberdeen T.C.—The corporation are advised by the Finance Committee to extend the accommodation of the fish market, at an estimated cost of £5,800.

Belfast T.C.—The new slipper Lassar baths at Ligoniel were formally opened last week. Mr. J. G. Gamble, of the city surveyor's department, was the architect, and the contractor was Mr. Isaac Copeland, Belfast.

Birmingham T.C.—The new offices of the Health Committee in Broad-street are to be structurally altered, at a cost approximately of £4,000.

Blyth U.D.C.—The tender of Messrs. Robson & Waddell, of Blyth, at £10,414, has been accepted for the erection of a new elementary school.

Boston T.C.—The amended estimate of the engineer, Mr. Webster, at £7,370, has been accepted for the new town bridge.

Brighton T.C.—A hostel is to be provided in connection with the grammar school, at a cost of £8,000.

Bristol T.C.—A report by the Baths Committee has been accepted recommending the erection of a new swimming bath for the benefit of the inhabitants of Bishopston, Horfield, and Ashley Hill district.

Cork R.D.C.—A building scheme is to be carried out for the provision of ten cottages, at £120 each.

Devonport T.C.—The tender of Mr. E. R. Lester, at £879, has been accepted for the erection of a swimming bath.

Durham C.C.—Mr. J. W. White's tender, at £5,039, has been accepted for a new girls' school at West Boldon.—An iron school is to be provided at West Stanley, at a cost of £1,437.

East Riding C.C.—The tender of Mr. J. T. Levitt, of Hull, at £3,693, has been accepted for a new school at Cottingham.

East Suffolk C.C.—Mr. W. C. Reade, of Aldeburgh, has secured the contract for building a new elementary school at Pakefield, at a cost of £5,177.—The tender of Messrs. T. Parkington & Son, of Ipswich, at £5,144, has been accepted for a new elementary school at Stowmarket.

Essex C.C.—A new secondary school is to be built at Southend, at an estimated cost of £20,127.

Leeds T.C.—The city engineer, Mr. W. T. Lancashire, has prepared plans for altering the market hall for the purposes of the tramway department.

Leyton U.D.C.—The tender of Mr. W. J. Maddison, of Canning Town, at £13,629, has been accepted for a new girls' and infants' school, and alterations to the Church-road School.

Llandrindod Wells U.D.C.—A new pavilion in the recreation ground of Llandrindod Wells, erected by the council at a cost of £6,000, and a free library in the town hall grounds, costing £1,600, which was provided by Mr. Andrew Carnegie, were opened on Saturday.

Luton T.C.—The tender of Mr. A. Cole, at £565, has been accepted for the erection of a new block at the hospital.

Nuneaton T.C.—Twelve slipper baths are to be erected near the electricity station, at a cost of £210.

West Riding C.C.—A new school is to be provided at Airton, at a cost of £874.

HOUSING AND TOWN PLANNING.

Birmingham T.C.—The council on Tuesday last sanctioned a town-planning scheme for East Birmingham at a cost of £69,000. The district comprised in the scheme covers an area of 1,443 acres, and Mr. Neville Chamberlain explained that this area had been divided into three zones, in one of which eighteen houses to the acre would be allowed; in another, which was more or less agricultural, twelve houses to the acre, and in the third fifteen houses to the acre.

Edinburgh T.C.—The Town Planning Committee recommend that the necessary steps be taken in connection with a planning scheme for the area of Bellevue on ground belonging to the Heriot and Hope Trusts. They also recommended the preparation of a scheme for an area on the west side of the city and one for ground in the parish of Corstorphine. The county council are already moving in the Corstorphine area, and it is proposed that the two bodies should work in harmony.

Rhondda U.D.C.—As the result of the investigations of two special Local Government Board inspectors, steps are to be taken to provide housing accommodation by the erection of dwellings with a kitchen, scullery, two or three bedrooms, and a bath in the scullery, at from 20s. to 24s. per month.

Rosyth T.C.—The town planning expert (Mr. Wilkes) has submitted his first set of plans for the laying out of the new town of Rosyth. An endeavour is to be made to have the final plans approved by the Local Government Board within nine months in order that builders may get started to the construction of the new town next spring.

Ruislip-Northwood U.D.C.—Notice has been given by the council that they have prepared a draft town planning scheme in relation to certain lands in the district, and in the rural district of Watford, in the county of Herts. Notice is also given that the draft scheme and maps showing the area of land included in the proposed scheme, and also showing particulars and details in relation to the proposed scheme, have been deposited at the council offices. The draft scheme and maps may be seen at the council offices aforesaid, and explanations or information with reference thereto will be given without payment of any fee during the period up to and including the 17th day of August, 1912.

Shrewsbury T.C.—The Improvement Committee have recently been considering plans for the development for building purposes of certain lands lying between Copthorne-road and Porthill-road, and the council have now concluded to make application to the Local Government Board for authority to prepare a town planning scheme in respect to this area of approximately 132 acres. With the exception of a few houses and gardens, the area consists of meadow land, and is well adapted for town planning.

PARKS AND OPEN SPACES.

Campbeltown T.C.—It has been decided to lay out a golf course at a cost of £200.

Edinburgh T.C.—The Parks Committee have recommended approval of sketch plans showing additions and alterations on the Tynecastle bowling green pavilion at an estimated cost of £150.

REFUSE COLLECTION AND DISPOSAL.

Lowestoft T.C.—In view of the expiry of the refuse removal contract in October, the surveyor, Mr. G. H. Hamby, was requested to submit a report on the practicability of carrying out the work by direct labour, and as a result it has been decided by the council to collect the refuse by means of their own vans and men.

Melton Mowbray U.D.C.—A sub-committee has been appointed to consider the provision of a refuse destructor.

ROADS AND MATERIALS.

Argyll C.C.—The Cowal District Committee have had correspondence with the secretary of the Road Board in connection with the road development of the district. The board asked that further particulars of the scheme of improvement on the Glencoe-Inveraray road be submitted before further grants be made, and the surveyor submitted two alternative schemes of road widening and improvement at a cost of £10,547

and £6,577. The chairman, with Maclachlan of Maclachlan and the surveyor, have been appointed to draw up a modified scheme.

Bootle R.D.C.—The highways surveyor, Mr. D. R. Dawson, estimates the cost of the necessary repairs to Seascale Hall-road at £352. The particulars have been sent to the parish council.

Bristol T.C.—Several road widenings are to be carried out at an estimated cost of £2,678.

Croydon T.C.—The council agreed on Monday last to widen West Croydon Bridge, at an estimated expenditure of £20,600, and to seek Parliamentary powers for acquiring properties in High-street, South-end, and Cherry Orchard-road in connection with widening schemes.

Heaton Norris U.D.C.—Earl's-road and Derby-road are to be made up at a cost of £1,037.

Lancashire C.C.—The Main Road and Bridges Committee recommend the reconstruction of the main Preston-road from the Freckleton Marsh gate to the Lytham boundary, at an estimated cost of £15,000. It is also suggested that the county council support the Fylde Rural District Council in an application to the Road Board for a grant towards the cost of the improvement.

Loughborough T.C.—Bridge-street is to be widened to a minimum of 40 ft. and repaved.

Lynton U.D.C.—The question of forming a new road from Hill's Ford Bridge to join the main Barnstaple-road, at a cost of £1,200, is under consideration.

Middlesbrough T.C.—Linthorpe-avenue and Oxford-road are to be made up at a cost of £1,000.

Shrewsbury T.C.—A tender has been accepted at £311 for improving the river wall and footpath opposite the county secondary public bowling green now in course of preparation.

Southampton T.C.—The borough engineer, Mr. J. A. Crowther, has been directed to report upon what additional land was required by him at the western shore for the storage of an adequate quantity of granite and road material for the making up and repair of the roads of the borough.

Southport T.C.—The borough surveyor, Mr. R. P. Hirst, is engaged in carrying through the boulevards extension from Eastbank-street, opposite the picture [illegible] Market-street.

Uckfield U.D.C.—The surveyor, Mr. E. Johnson, has been instructed to prepare plan and specification for the making up of Mill-lane. The cost of the work is estimated at £250.

Westminster B.C.—The Improvements Committee have received a notification from the London County Council on behalf of the Grosvenor estate for a new building line at the corner of Oxford-street and Park-lane. It is proposed to give up to the public way some 300 sq. yds. in Oxford-street, 167 sq. yds. in Park-lane, and 96 sq. yds. in North-row. The city engineer, Mr. J. W. Bradley, estimates the cost of the paving in Oxford-street at £480, in Park-lane at £350, and in North-row at £100, a total cost of £930, exclusive of the cost of alterations to main, cables and boxes, which will probably not exceed £200. The committee approved the scheme, and advise the council to undertake the necessary paving works.

West Sussex C.C.—In view of the danger arising from heavy traction engines standing in the roadway for the purpose of taking water, and also in consequence of the damage which might be done by these heavy engines standing on bridges, it has been decided that a notice be posted on each of the county bridges warning drivers of locomotives that their engine must not remain stationary on any bridge, arch, or culvert, or within 10 ft. from the face of the abutment of any bridge, arch, or culvert. The county surveyor has reported that the question of the provision of water can be economically and satisfactorily dealt with by the [illegible] and has reported in detail regarding the tenders received from wide contractors, and requested permission to prepare and submit for consideration particulars of a scheme for putting this into effect next season. The council have agreed that this be carried out. The county surveyor has been authorised to purchase four convertible tractors and steam rollers from Messrs. Aveling & Porter, Limited, at a cost of £2,540.

SEWERAGE AND SEWAGE DISPOSAL.

Caerphilly U.D.C.—Messrs. Wilcox & Raikes, engineers, have been instructed to prepare plans and specifications for the sewering of Nelson, and steps are to be taken to acquire the necessary land for disposal works.

Camborne U.D.C.—The Local Government Board has given a general consent to the North Cliffe sewerage scheme, for which a loan for £25,000 has been obtained.

Hinckley U.D.C.—The Highways Committee are considering a proposal to construct a new main outfall sewer, at an estimated cost of £5,000.

Larne R.D.C.—The tender of Mr. W. Geddis, of Belfast, at £3,027, has been accepted for the sewerage of the parish of Groenisland.

Lymm U.D.C.—Messrs. Bennie & Thompson, of Warrington, have obtained the contract for sewerage works, at the price of £6,917.

Middleton T.C.—Messrs. J. Diggle & Son have prepared plans of the proposed extensions and alterations at the sewage works. The scheme has been based upon a dry-weather flow of 1,300,000 gallons per day, including subsoil and trade waters. To meet the latest requirements of the Local Government Board the scheme makes provision for the construction of two storm-water tanks for the treatment [illegible] storm water, 100 ft. long, 43 ft. wide and 7½ ft. deep, containing in the whole 400,000 gallons. An installation of electrically driven plant has been provided for to supplement the present gas-power plant. The total estimated cost of the complete scheme is £25,000.

Tenby T.C.—The dilapidated and unsafe condition of the culvert is fully reported upon by the surveyor, Mr. Bertie Morley, who proposes that the whole of the trunk be opened out, the present sides thrown down and a 4-ft. diameter cast-iron pipe outfall laid on the present trunk bed for a foundation and carried to the original length of the outfall, 600 ft. from the air-shaft, at a cost of about £1,300.

West Bridgford U.D.C.—The new bacterial sewage purification and pumping plant was inaugurated last week. The total cost of the installation was £4,031. A tribute was paid to the surveyor, Mr. William Pare, for the valuable assistance he rendered in connection with the scheme.

WATER, GAS, AND ELECTRICITY.

Aberystwyth R.D.C.—It is proposed to provide a water supply for Llanbadarn.

Chester T.C.—The electricity department earned a nett surplus last year of £4,251.

Glasgow T.C.—It is recommended by the Watching and Lighting Committee that the lampfitters' labourers employed in the lighting department whose wages at present are at the rate of 22s., rising to 23s. per week, be paid a minimum of 23s. per week, with increments rising to 25s. per week after five years' service.

Hinckley U.D.C.—The tender of Messrs. Bever, Dorling & Co., Limited, of Bradford, at £1,210, has been accepted for increasing the existing pumps at Snarestone Waterworks pumping station; that of Messrs. Gunson & Co., Limited, of Leicester, at £180, for a new steam winch and head gear to the well at Snarestone; that of Mr. W. Flavell, of Hinckley, at £35, for a new iron winch head; and that of Mr. E. Gr[illegible] of Hinckley, at £5, for a new [illegible] at the depot.

Kingston-upon-Thames T.C.—The debit balance on [illegible] working of the electricity undertaking for the year [illegible] against £1,192 the previous year.

Malton R.D.C.—A plot of land at Amotherby is to be purchased for a water supply for the street villages. A water diviner has reported that there is water in abundance in the locality.

Nottingham T.C.—Exhaust turbines and cooling towers are to be installed at the St. Ann's power station, at a cost of £17,000. It is expected that the consequent saving in the cost of producing current will be a little over £3,000 per annum. The cost of the installation is to be drawn from the reserve fund.

Nuneaton T.C.—The tender of Messrs. James Simp[illegible] & Co., of Leicester and Newark, at £1,897, has been accepted for the installation of pumping plant at the Gas & Oil pumping station. The council has also accepted the tender of the Stanton Ironworks Company, Limited, for about 200 tons of 9-in. pipes.

Southampton T.C.—Upon the recommendation of the water engineer, the council have decided to purchase superheaters and steel mains for the waterworks, at a cost of £475.

Twickenham U.D.C.—The tender of the Brentford Gas Company has been accepted for one year for street lighting. The terms are £1 11s. 2d. per annum for a burner of approximately 80-candle power, which, with the present average cost of maintenance, cleaning, lighting, extinguishing, repairs, and renewals (£1 3s. 6d.), gives a total cost of £2 14s. 8d. per lamp per annum. The tender of Messrs. Parkinson & W. & B. Cowan, Limited, for the supply of three dozen 15-in. square street lanterns, at 34s. each, has also been accepted.

MISCELLANEOUS.

Aberdeen T.C.—The profit accruing from the tramway undertaking last year was £11 158, the largest ever recorded, and an increase of £3,554 over the previous year.

Cardiff T.C.—The nett surplus on the working of the tramways last year is £18,522, an increase of £6,488 compared with the previous year.

Glasgow T.C.—By 30 votes to 17 the council last week rejected a proposal to establish a works department charged with the duty of co-ordinating the works of the various departments, and where practicable submitting tenders for the work of the various departments of the corporation to be carried out by its own workmen in the direct pay of the corporation.

Southampton T.C.—The offer of Messrs. Shand, Mason & Co., at £30, for two manual fire engines has been accepted, and it has also been decided to purchase from the London County Council a motor escape van for £300.

York T.C.—The city engineer, Mr. F. W. Spurr, has been instructed to obtain tenders for a steam wagon and trailer at an estimated cost of £650.

PERSONAL.

Mr. S. E. Burgess, M.INST.C.E., borough engineer and surveyor of Middlesbrough, has been elected a Licentiate of the Royal Institute of British Architects.

Mr. T. Henry, surveyor to the East Retford (Notts) Rural District Council, has been voted £25 a year (instead of 10s. 6d. for each case) for the inspection of petrol licences.

Mr. James S. Hurst, at present deputy borough surveyor of Bridlington, is recommended by a special committee for the appointment of borough surveyor and inspector of nuisances of Southwold.

Mr. Samuel Gladwin, quantity surveyor under the Derbyshire County Council, has been appointed quantity surveyor in the architect's department of the Essex County Council, at £200, rising to £250 a year.

Mr. Alfred Barlow, ASSOC.M.INST.C.E., chief assistant in the city engineer's office at York, has been appointed city engineer and surveyor of Ripon in succession to Mr. T. P. Frank, ASSOC.M.INST.C.E., who was recently appointed borough surveyor of Newark-on-Trent. The salary is £150, rising to £200.

Mr. Frank Chappell, the town engineer of Oshawa Ontario, is a native of Cardiff. After completing a five years' apprenticeship course in the workshop and offices of the Mercantile Pontoon Company, ship builders and repairers, of Cardiff, and winning a scholarship, he began a course of study in civil and municipal engineering at the University of South Wales, from which he graduated in 1907. Going to Canada, he entered the service of the Grand Trunk Railway Company at Montreal; and in 1908 he attended the Department of Surveying of McGill University, and later took up post-graduate work in municipal engineering there. After completing this course he engaged in private practice until 1909, when he was appointed town engineer and superintendent of waterworks at Oshawa.

FOR OTHER ADVERTISEMENTS

See End of Paper.

GOOD CLERK OF WORKS required by the Surrey County Council, for erection of a Ferro-Concrete Bridge. Engagement about four months. Previous experience in ferro-concrete bridge construction and pile driving essential. Application, stating age and experience, with testimonials or references, and salary required, to Mr. A. Dryland, M.INST.C.E., County Surveyor, County Hall, Kingston-on-Thames.

COUNTY OF SURREY.

COUNTY SURVEYOR'S DEPARTMENT.

Required, an Engineering Assistant. Commencing salary £120, rising by annual increments of £10 to £200.

Must be good and expeditious draughtsman, and capable in preparing specifications, quantities, and estimates, and calculations of stresses, &c.

Also an Office Clerk. Commencing salary £80, rising by annual increments of £5 to £130.

Must be good shorthand writer and typist, with a knowledge of accounts. Experience in a surveyor's office desirable.

Forms of application setting forth the conditions of the appointments may be obtained of the undersigned, and must be sent in duly filled up by Friday, the 16th August, 1912.

A. DRYLAND,
County Surveyor.

County Hall,
Kingston-on-Thames.
July 31, 1912.

SHANGHAI MUNICIPAL COUNCIL.

PUBLIC WORKS DEPARTMENT.

SECOND ASSISTANT ENGINEER.

Applications are invited for the post of Second Assistant Engineer in the Public Works Department.

Candidates should be about 24 years of age and unmarried. Salary Taels 250 per mensem, without allowances, under a three years' agreement. The value of the Tael at present rate of exchange is about 2s. 8d., but it is liable to fluctuation. Particulars of the appointment may be obtained of the Council's Agents, and applications in Candidate's own handwriting, stating qualifications, experience, &c., accompanied by copies of not more than three recent testimonials, and endorsed "Second Assistant Engineer," should be forwarded on or before August 16th, 1912, to

MESSRS. JOHN POOK & CO.,
Agents for the Shanghai Municipal Council.

63 Leadenhall-street,
London, E.C.
July 31, 1912.

ATHERSTONE RURAL DISTRICT COUNCIL.

WATER SUPPLY.

TO WELL BORERS AND OTHERS.

The above Council invite Tenders for Sinking a Borehole and Testing the yield of Water therefrom in the Parish of Polesworth, within their District.

Specification and Form of Tender may be obtained at my office upon payment of the sum of £1, which will be refunded upon the receipt of a *bona-fide* Tender and the return to me of all documents supplied.

Sealed Tenders, in the envelopes supplied, must reach Mr. W. A. Hatton, Clerk to the Council, Atherstone, not later than 9 a.m. on Tuesday, the 13th August, 1912.

The Council do not guarantee the acceptance of the lowest or any Tender.

H. J. COLEBY,
Engineer and Surveyor.

Council Offices,
102 Long-street,
Atherstone.
July 31, 1912.

BOROUGH OF SOUTHPORT.

The Corporation of Southport require immediately the services of a Surveying Assistant for a few months. Must be experienced in Surveying and Levelling, and be a good Draughtsman. Wages Two Pounds Ten Shillings per week. Applications, stating age, experience, when at liberty, and accompanied by not more than three testimonials, to be sent to the undersigned not later than 10 a.m. on Monday, August 12th. Canvassing will disqualify.

J. ERNEST JARRATT,
Town Clerk.

Southport.

Notes on the Extension Seawards of the Gynn Outfall Sewer at Blackpool.*

By JOHN S. BRODIE, M.Inst.C.E., Borough Engineer and Surveyor, Blackpool.

The following note may be of interest to the members of the congress, describing the method of extending seawards a main outfall sewer on the system adopted by the author at Blackpool in 1907, and which has since been adopted at other seaside towns.

The old outfall at Gynn, Blackpool, was 1,304 ft. in length, and consisted of cast-iron flanged pipes, 3 ft. internal diameter, in 6 ft. lengths, bolted together and supported on timber piles and cradles. This outfall was laid in 1898, at the cost of £6,755, or at the rate of £15 10s. 9d. per linear yard. The work in 1898 was carried out by a contractor, and was never really completed to its intended length, which was 1,400 lin. ft., on the ground that the difficulties in connection with stormy seas and deepening water were so great that further extension was impracticable. Since then, sand and silt have formed seaward of the old outlet, and it has been found necessary, in order to prevent the sewage from lodging on the foreshore, to extend the outfall across the recently formed sand banks into deep water seaward of the same.

The present extension has been made by means of a continuous steel tube, 3 ft. internal diameter, of solid welded pipes in 18-ft. lengths, formed of open hearth steel, ⅛ in. thick, riveted together with cover straps 10 in. wide, ⅛ in. of thickness, with a double row of ¾-in. rivets, spaced 3 in. centre to centre. The quality of the steel was such that the ultimate tensile breaking stress averaged 26 tons per square inch, with an ultimate elongation of 20 per cent in 8 in. The whole of the tube, both inside and outside, has been heavily coated with an improved bituminous preservative. In order that the new tube should fit properly on to the flanged end of the old outfall, 10-in. square Karri wood piles were driven on each side of the trench at intervals of 6 ft. centre to centre, and connected by half-timber walings, to which close timbering, 3 in. thick, was secured, for a distance of 86 ft.

Fig. 3.

Longitudinal section, showing method of dropping tube in position.

Blackpool Outfall Extension Sewer.

* Paper read on Tuesday at the Conference of Engineers and Surveyors held in connection with the Annual Congress of the Royal Sanitary Institute at York.

The tube was built up, for a total length of 600 ft., on the foreshore above high-water mark, at a distance of 3 miles along the coast line from its ultimate destination. In order that, when laid, the tube should not be subject to a rolling or rocking action on the sea bottom, caused by heavy on-shore gales, transverse steel bed-plates, 9 ft. long by 12 in. wide, and ½ in. in thickness, turned down at the ends for a length of 12 in. as shown in Fig. 1, were riveted to the tubes at 18 ft. centres, except for the 86 ft. length referred to above, where the tube rests on the Karri wood and steel cradles.

After being completed the tube, which is provided with a 24-in. manhole and cover at each end, and also with blank flanges at the open ends, was filled with water and tested to a pressure of 50 lb. per square inch, at which pressure it was found to be

perfectly tight. Timber watertight stoppers, easily removable, were then inserted at each end of the tube, close to the manholes above referred to, and caulked up watertight. The blank flanges were then securely fastened to the ends of the tube, and the manhole covers on the two manholes, one at each end, were also secured and made perfectly watertight. The tube was then launched from above high-water down the foreshore, to such a level between high and low water marks as would enable it to float with a 24-ft. spring tide. It was then floated into the sea, and towed by means of a steam tug for a distance of 3 miles, and was adjusted at high water over the trench, by means of guide piles as shown in Fig. 3, where it was ultimately intended to lie. The blank flanges at both ends were then removed, the temporary stoppers maintaining the tube afloat. On the tide receding, the tube dropped down into its permanent position, the flow of sewage being held up temporarily by the shore penstock valves; the shoreward-end flange was then bolted up to the flange of the old cast-iron pipe, by means of 12 1⅛-in. steel bolts, and so secured in continuity of the old outfall. The manholes at both ends were then opened, the temporary timber stoppers were removed, the new outfall was then ready for the passage of the sewage.

The cost of the steel tube, which was constructed under contract by Messrs. Clayton, Son & Co., Limited, of Leeds, was £1,358, and the cost of launching, floating and laying was £592, a total cost of £1,950, or at the rate of £9 15s. per lineal yard.

Fig. 1 shows a plan and section of the new outfall tube sewer.

Fig. 2 shows the cross-section of the sewer as laid on the cradles for a length of 864 ft. seaward of the end of the old outlet.

Fig. 3 shows the tube afloat, dropping down into its position on the receding tide.

The tube was manufactured and delivered on the foreshore at Blackpool by Messrs. Clayton, Son & Co., Limited, of Leeds, and the launching, floating and laying has been carried out departmentally under the author's assistant, Mr. H. Banks.

CORRESPONDENCE.

"*Be calm in arguing; for fierceness makes*
Error a fault and truth discourtesie."
—Geo. Herbert, "*The Temple.*"

BACTERIA.

To the Editor of The Surveyor.

Sir,—Although a constant reader of your excellent paper, it is seldom I have troubled your correspondence columns. I think, however, this now seems necessary, as otherwise some misapprehension may arise over your leading article last week, and what I was reported to have said when proposing the vote of thanks to Mr. Ransom for his useful paper on "Bacteria" read at the annual meeting of the Institution of Municipal and County Engineers at Caxton Hall, Westminster.

The shorthand reporter has unfortunately missed out the two small words "do not," which materially alter the meaning of my observations. This may have been my fault for not speaking more clearly, as I notice one or two other small omissions from the verbatim report, a copy of which I have now obtained.

Referring to the sterilisation of milk, &c., the words I actually said were "as by so doing we *do not* only eliminate pathogenic organisms, &c." It would have been absurd to have made the statement as printed, which is manifestly incorrect; but my point was that in addition to the elimination of pathogenic or harmful bacteria from water, milk and other foodstuffs—which everyone desires—the process of sterilisation removed many other bacterial organisms which may be neutral or even beneficial to the human body, or probably advantageous in counteracting the influences and effects of other harmful bacteria.

It is, I think, recognised by medical men, and also by bacteriologists, that many sterilised articles are particularly susceptible to harmful influences if exposed for only a short time in a bad atmosphere, and it is probable they may then take up other bacterial organisms, which may be even more harmful than those originally dealt with.

Where material is known to be polluted with definite pathogenic bacteria, it would, of course, be wise to adopt the best-known method of dealing with same, which at present is sterilisation, but I am of opinion that the treatment of foodstuffs will not be the complete sterilisation of all bacterial life, but only the elimination of pathogenic organisms so soon as bacteriologists or scientists in the future have discovered the means for effecting such treatment.

You also add "How would Mr. Willis strengthen the phagocytes, &c.?" Surely this is a needless question, since it is ancient history that the white corpuscles of the blood are the fighting element against disease germs. The improved sanitary condition of homes, cleanliness of person, wholesomeness of solid and liquid foods, and obedience to the ordinary laws of health, are all helpful and even necessary to the attainment of this object, while I have no doubt medical science will even add to the above brief list of measures for improving the general health of the individual, as well as the community, and you will probably admit disease germs do not thrive as a rule in persons in perfect health.

Regretting to trouble you to insert this correction.—Yours, &c.,

Edward Willis.

Town Hall, Chiswick.
July 30, 1912.

[Our apologies are due to Mr. Willis for the error in the report of his speech, and under the circumstances our criticism was, to a large extent, out of place. We quite agree with all that Mr. Willis says in the last paragraph of his letter, but in his speech he seemed to deprecate the use of sterilisation, preferring rather to depend upon general methods of improving conditions of health. Until the white corpuscles or "phagocytes" of every single person, from infants upwards, are in such excellent fighting trim that they are capable of successfully resisting the attacks of any number of disease germs of any kind, we consider that sterilisation affords a valuable means of protection.—Ed. The Surveyor.]

MOLESWORTH'S FORMULA FOR MASONRY DAMS.

To the Editor of The Surveyor.

Sir,—I notice in your issue of July 19th a reference to an objection to my formula for masonry dams on the ground that it does not take into account the specific gravity of the masonry.

May I draw your attention to some remarks I made on this subject in the discussion of Prof. Kreuter's paper on masonry dams (p. 84, "Proceedings" of the Institution of Civil Engineers, Vol. cxv.), in which I said that in 1873 I had been asked to devise some simple formula which would give results approximate to the complicated formulæ of the French engineers. I stated in discussion that

> "at the outset I had discovered a circumstance which had much simplified my labours, namely, that the weight of masonry did not materially affect the profile of the dam, because, though heavier masonry generally involved increased pressures on the base of the dam, yet the resultant pressure was thrown further away from the outer face, and there was not a greater *maximum* pressure on the wall."

An inspection of the section (page 86, vol. cxv.) shows an extraordinary coincidence, under varying limits of pressure and density of masonry, between the results of my formula and those of the more complicated formula of M. Bouvier, which take into account the density of the masonry.

The sections given on page 87 also show an extraordinary coincidence between the results of my formula and actual practice.

My formula, as given on page 315, Molesworth's Pocket Book, is combined with a provision to allow for the weight of masonry (in the formula $y = \frac{x}{\sqrt{s}}$ as a minimum), to keep the resultant of pressure within the middle third, as recommended by Rankine, where s = the specific gravity of the masonry.

In practice, however, I have never found it necessary to use this correction as a minimum.—Yours, &c.,

Guilford L. Molesworth

The Manor House,
Bexley, Kent.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

The first day's proceedings at the recent annual meeting of the Institution of Municipal and County Engineers included the consideration of the following papers: -

TOWN PLANNING: LAYING OUT NEW TOWNS AND CITIES.

By W. H. Price,
Sewerage Engineer's Office, Leeds.

Town Planning played so prominent a part at the last annual meeting, that it is only the well-known interest of the past-president and the members generally in the subject that induces the author to offer still another paper on town planning. The laying out of a new town or city rarely falls to the lot of anyone in these days, though Barrow and Eastbourne, and on a smaller scale, Port Sunlight, Letchworth, and other places, have been laid out and developed during the lifetime of the present generation. Speaking generally, it is to the newer countries, such as America, or our colonies and dependencies, that the town planner must look for the best opportunities for showing his skill in the designing and laying out of new towns and cities.

The laying out of Delhi as the capital of India, and of the Federal Capital of Australia, are two of the largest and most recent schemes offering scope for the present-day town planner, and it is a matter for congratulation to all members of the institution that one of their past-presidents should have been honoured by the Government as being the first man selected for the work of laying out Delhi. That the work of Mr. Brodie and the gentlemen associated with him in the laying out of Delhi will be of the greatest interest and be extremely useful to all members of our institution there can be little doubt, and it is sincerely to be hoped that at some future time Mr. Brodie will be able to give to his brother municipal engineers the benefit of his experience in the laying out of this historic city.

Although the conditions of the competition recently promoted by the Australian Government for laying out the Federal Capital were not sufficiently inviting to induce many Englishmen to submit schemes, the competition still offered one of the few opportunities for putting into practice on a large scale the teaching of the past few years on town planning. Though the Federal Capital will probably never equal the size and magnificence of Delhi, it is still of sufficient importance to afford great scope for the skill and imagination of the engineer and architect; while it presented an opportunity for a young man to try his "prentice hand" that may rarely fall to his lot in the future.

The author is not prepared to claim any great merit for the scheme, which is described in the latter portion of the paper, and for which he was jointly responsible; but he is hopeful that the experience gained in its design will be helpful to his fellow-students, if not to the older and more experienced members, of the institution. Experience is the best teacher, and it is only by actually sitting down to design such a scheme that one finds out his limitations and the difficulties with which the subject bristles, or learns how to apply the experience and teaching of past and present town planners to the requirements of to-day and the future.

It may be laid down as an axiom that each particular town or city will have some special characteristic or distinctive feature that will influence and dominate the whole design. The social, civic, and industrial character of the city, and its situation and general topographical character, have all to be carefully considered, and given their proper importance and place in the design. While some special feature is almost bound to predominate, there are still many features common to all cities; and it is possible to lay down something like general rules, while recognising that exceptions will have to be made in particular cases. Among the first essentials for all well-planned towns are:

(1) The provision of an adequate water supply.

(2) An efficient sewerage and drainage system.

(3) Proper sanitary arrangements, scavenging, and the removal and disposal of house refuse.

(4) The construction of main, secondary and residential roads, and streets and bridges.

(5) A railway system, tramways, or other means of communication.

(6) Gas and electricity for lighting or power, and hydraulic, pneumatic, or other forms of power.

(7) The provision of parks, recreation grounds, and open spaces.

(8) Public, industrial, and residential buildings, the necessity for architectural and artistic treatment of the public and private buildings, parks, &c.

In order to prepare a town plan for carrying out these works it is first necessary to define the area to be dealt with, estimate the probable growth and development for thirty or fifty years, and decide upon the character of the town. The site having been carefully selected with due regard to obtaining a good supply of water, disposing of the sewage, and the convenience and amenities of the population, the area should next be carefully surveyed and a plan made, preferably to a scale of not less than 1/2,500, showing all the natural features of the area, such as woods, trees, rivers and streams, or hills, and giving contour lines at every 5 ft. or 10 ft. Models of the site are unnecessary where a plan contoured to every 5 ft. is provided. If a river or stream runs through the site the flood level should be shown, and in the case of a seaside town or tidal river the H.W.M.O.S.T. must be given.

Having obtained our contour plan with the natural features of the site, we next proceed to locate the different areas, such as government, civic, commercial, residential and industrial areas. With the growth of imperial officialism it is probable that most large towns will in the near future require an area for Government offices; but, except in the case of a capital city, these can generally be combined with, or merged in, the civic area. In a capital city the Houses of Parliament with the Government offices will occupy the most important position, and these with the civic area embracing the city hall and municipal offices should have a central and dominating position. The commercial and shopping area will generally be best placed between the civic and residential areas, and the residential area will occupy the zone outside the central area and extend to the outskirts of the city.

The industrial area should be located so that the prevailing winds will carry away the smoke from factories without nuisance to the residential or other areas. Its convenience to railway, river, or canal is a matter of great economical importance to the industrial interests, as well as of convenience and comfort to the residents generally, by avoiding carting goods through busy streets. The planning of the principal streets and boulevards is perhaps the most important part of the laying out of a city. When the city is to be large and important its beauty depends very largely on the laying out of its streets, boulevards, bridges and parks. The direction, width, gradient, and the laying out of the streets so as to provide vistas of the principal buildings, and the provision of squares, circuses and crescents, are important points, and call for very careful consideration. The question of straight or curved streets is one very largely of convenience *versus* picturesqueness. Generally, it may be said that in the business areas the streets should be wide, direct, and have as easy gradients as the physical character of the site will permit; while in the residential areas curved, irregular and undulating streets will add to the beauty of the district, and will frequently prove more economical in construction.

The formal or informal systems of town planning, with the streets laid out rectangularly or radiating in the former case, and as rings or with irregular lines and gradients in the latter, each have their advocates. The wise course in this, as in other matters, is to avoid extremes and refuse to be bound to any one system. In practice it will generally be found that the rectangular and radiating systems are most suitable for the central and business areas, while the ring boulevard on the outskirts of the town is most convenient, and irregularity of planning in the residential portion of the town enhances the charm of the district, and adds to the amenities of the residents.

The widths of the streets, while mainly governed by the traffic requirements, must also be considered in connection with the size and architecture of the buildings. Tall or imposing buildings placed in narrow streets not only lose in architectural effect, but suffer from a sanitary point of view through want of light and air. On the other hand, too wide streets in working-class districts tend to the building of high tenement houses and flats, and overcrowding. The cost of the land, as well as the cost of construction of streets, must be borne in mind in deciding the width of streets, for where land is practically obtained for nothing and materials obtained on the spot, as in the case of the Federal Capital of Australia, a greater width can be provided than in the case of London or Berlin, where land is costly, and materials are only obtained from outside the city. The sale of great advantage to be able to transport coal or other necessaries by subway. In many towns, as at Chicago, underground railways or subways would allow the goods stations to be located some miles outside the city, and the goods conveyed to the doors of the users in various parts of the town without interfering with the traffic in the streets. It is not desirable to have underground railways for passengers, but this can only be avoided in large towns by having roads of ample width to allow tramcars or motor 'buses to run without interfering with other traffic.

The tramway, trackless tramcar, and the motor 'bus will probably all find a place in the design of an up-to-date city. The tramway is likely to be most economical and convenient in the central and busy parts of the town, while the greater flexibility and saving in track of the trackless trams or motor 'buses

Proposed Lay-out of Australian Federal Capital.

(Plate 1.)

the land for building purposes, again, places at the disposal of the Australian Government funds for laying out the streets, bridges and parks on more generous lines than the town or city where the land belongs to a number of private owners.

The majority of the bridges in London and throughout the country are too narrow for the traffic they carry, and in the case of a capital city it is desirable that the bridges should be of an imposing width, and of a monumental character.

The disturbance of the roadways of our principal streets through making connections for water, gas, electricity and other purposes is a source of great inconvenience to pedestrians, a danger to vehicular traffic, and an injury and loss to all engaged in business in such streets. That subways should be provided for pipes to avoid breaking up the roads is certainly desirable in the case of new cities, and in these days of coal and transport workers' strikes it will be a make them preferable for serving the outlying districts of the city.

A central railway station with suburban stations convenient to the residential areas are required. The goods station or marshalling yard should be placed at a spot where it taps the goods traffic coming into the city, and it should be convenient to the industrial area, with rails running into the chief factories or workshops, so as to save cost of transhipment, or carting through the city.

Parks and recreation grounds are needed in all cities, and as far as possible all natural features, such as trees, forests, watercourses, hills, or ravines, should be preserved, and incorporated in the design of the parks. Low-lying land near a river which is unsuitable for building purposes can generally be utilised for recreative purposes, and forests and hills form a natural belt of woodland and park, which not only present a

splendid outlook from the city, but tend to preserve the health and amenities of the inhabitants.

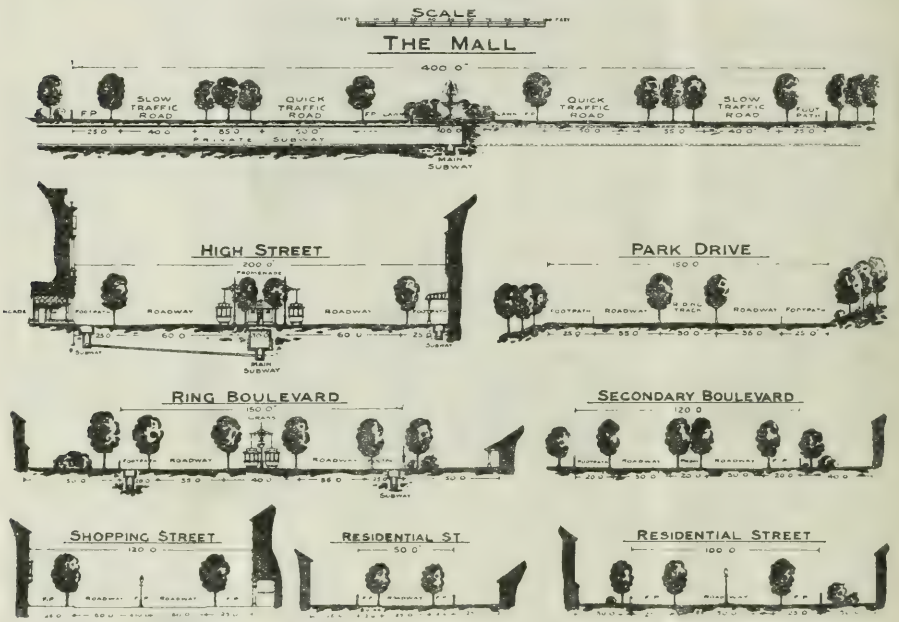
The chief religious and educational buildings should be grouped together, and the cathedrals and university should have dominating positions so as to form a good landmark from all parts of the city. Smaller churches and schools should be located in various areas suitable to the requirements of the district. The art gallery, museum, library, and places of entertainment should be centrally situated, with baths, drill hall, fire station, markets, hospitals and cemetery in convenient spots.

The water supply is of great importance, and whether this can be obtained from the hills or lakes as an upland surface supply, from wells or springs, or from a river, can only be decided by a careful study of the physical character of the locality, with full particulars of the rainfall over a number of years, and a thorough knowledge of the geological formation. The selection of the gathering grounds, river or wells, with sites for impounding and service reservoirs, filters or pumping stations, and the arrangements for the distribution of water, all call for the expert services of the engineer.

The question of separate supplies for potable, trade or sanitary purposes, will also have to be considered; dentally making possible the reclamation of low-lying lands for parks or recreation grounds; or for the provision of weirs for holding up the river waters for boating and other purposes during the dry season, all call for engineering skill and experience.

Scavenging and watering of streets play an important part in the well-being of any town, and the provision of suitable means for transporting and disposing of the scavenged materials, or for watering and washing the streets, has hardly yet received that close attention and study which it deserves.

The collection and disposal of refuse is another problem waiting fuller consideration. While the introduction of the refuse destructor has made a great improvement in the disposal both from the sanitary and economical point of view, the method of collection still leaves much to be desired. No method of house-to-house collection, with its vast amount of hand labour and untidy littering of the streets, can be considered satisfactory. It is not only desirable, but it also appears practicable and economical to provide for the removal of all dust and household refuse by pneumatic power, worked on the vacuum system. The vacuum cleaner has been in use for several years for removing dust from domestic articles. Sewage is now drawn to a



Street Sections.

(Plate 2.)

for unfiltered water can not only be used safely for many purposes where pure filtered water can now be badly spared, but it may also be possible to utilise many sources where the chemical or bacterial conditions make the water unsuitable for drinking purposes.

The sewerage system and the disposal of the sewage are important matters in the laying out and planning of a town. The engineer designing a scheme for a new city will, in the laying out of his roads and streets and the allocation of his different areas, constantly have to keep before him the lines and gradients of his sewers, and the position of the outfall or sewage disposal works. The obtaining of a purely gravitation scheme and avoidance of pumping if possible, are points which will require his careful consideration.

Storm water is frequently more difficult to deal with than sewage, though, where a river or good watercourses are available for discharging into, they simplify the difficulty to a great extent. On the other hand, the river or watercourse is frequently an additional source of trouble, owing to the necessity for prevention of flooding in the districts adjoining the river or watercourse. The impounding of the flood waters by reservoirs or lakes, or controlling the floods by raising the embankments of the river, and incicentral station by vacuum pumps at several places; and as we have pneumatic tubes for the conveyance of letters and parcels, there is no reason why the system should not be adopted for refuse collection in preference to the unsightly and insanitary method of loading by hand into carts or vans. The refuse would be simply tipped into a bin or hopper at each house or shop, connected to the pneumatic tube and controlled by valves, and be drawn to the refuse destructor, where it could be fed directly into the furnaces without handling. The steam generated from the destruction of the refuse would be sufficient to provide the greater part of the power required for the vacuum pumps, and it would therefore prove to be a very desirable, sanitary and economical method of collection.

The paper up to the present has dealt chiefly with the engineering and purely practical portion of town planning; and while it can certainly be claimed that these are not the least important, it can readily be admitted that the architect, sculptor and landscape gardener have an important part to play in the development of the town.

The engineer is mainly responsible for the laying out and utilitarian portion of the town planning, but for the completion and ornamentation of the

town we turn to the architect, artist and sculptor. The engineer and surveyor must provide opportunities for the exercise of the skill and taste of the architect by laying out wide streets, leafy boulevards, and stately squares on which he can erect his buildings. Buildings for national, municipal, ecclesiastical, educational and entertainment purposes offer full scope for the architect to exercise his powers of design and artistic leanings without encroaching on the domain of the engineer and surveyor; while the domestic buildings give him an opportunity for displaying the common sense and good taste which has placed English domestic architecture in a class by itself. The battle of the styles may be left to the architects to fight out, but it may be said that a due regard must be paid to climatic conditions, the development and use of local materials, and historical associations or local usage. The use of statuary or monumental work in the adornment of the public, ecclesiastical or other buildings, in the public parks, gardens, squares and bridges, must be on generous as well as artistic lines, though unfortunately economical rather than artistic considerations too frequently prevent the sculptor being given the full and proper opportunity his art demands. The landscape gardener also cannot be ignored in laying out large parks or gardens, for a knowledge of plants, trees, shrubs and flowers must be combined with artistic feeling and the power of planning, while the natural beauties of the site must be carefully preserved.

principal plan presented for the guidance of the competitors was a contour plan to a scale of 400 ft. to an inch, which showed the Molonglo River flowing practically through the centre of the city, the flood levels, the chief watercourses, woods, and hills, the suggested position and levels of the railway, the geological formation, and the contours of the site at every 5 ft.

Several other plans were given showing the position of the Commonwealth territory; a topographical map of the territory to a scale of 1 mile to 1 in.; a contour map of 20 chains to 1 in., and maps showing the rainfall and temperature statistics, and a geological survey of the site. A very full description of the requirements of the city was given with the conditions of the competition, and reports on the geology and rainfall of the district were also supplied.

Models of the site of the city were exhibited in Australia, London, New York, and several Colonial and Continental cities. The model exhibited in London afforded very little additional information beyond what could be obtained from the large contour plan, and although the principal features of the scheme were settled on the contour plan before the model was inspected, there was no necessity to alter any of these as the result of the inspection. The scale of the model was a natural one, and on the small scale to which the model, representing some 9 or 10 square miles, was necessarily plotted, 50 ft. rise or fall was scarcely noticeable. The contour plan to a scale of 400 ft. to 1 in. was issued in duplicate, on one of which the laying out of the city was to be shown, and this was practically the only plan necessary with the full information given in the instructions to competitors. The capital city is to be the seat of Government, with Houses of Parliament, Government Offices, and Courts of Justice; and except for the manufacture of Government stores is hardly likely to have any large industries within its borders. It will be essentially a residential city.

Description of Scheme for Laying out the Federal Capital of Australia.

The Federal Capital City of the Commonwealth of Australia is to occupy an area of about 16 square miles, of which about 9 square miles is dealt with in the scheme shown on Plate No. 1. An area of about 900 square miles, lying about 70 miles from the sea and 150 miles south-east of Sydney in the Yess Canberra country, has been reserved as Commonwealth territory, and it is in the northern portion of this country that the capital city is to be laid out.

The population to be provided for is 25,000, and in the scheme now described it was estimated that this population would be reached in some fifteen years, 50,000 in thirty years, and 100,000 in fifty years. The

The Molonglo River runs through the middle of the site, which is surrounded with well-wooded hills, rising from 800 to 1,000 ft. above the level of the river. The prevailing winds are westerly and south-westerly, and are very cold and biting in winter, and these had to be fully taken into consideration in allocating the different areas, and fixing the sites of the main buildings.

The Houses of Parliament were located on Camp

Hill, south of the Molonglo River, the position being central and dominant, well sheltered by a natural belt of trees from the cold westerly and south-westerly winds in winter, and open to the cooling north winds in summer. It is approached by easy gradients from, and within easy reach of, the central station, and commands fine views of the Molonglo River and the distant wooded slopes of the Black Mountain and other hills on the north. The Government offices are grouped together convenient to the Houses of Parliament, facing the Parliament Square and The Mall. The Post Office and Courts of Justice are near the central station, and the State House, Art Gallery, Museum, and Reference Library lie between the Houses of Parliament and the Church of England Cathedral and the University. cathedral is situated to the south of the Houses of Parliament, and the road devoted to clubland, shown as Pall Mall.

The Government and civic areas are kept distinct, though both are fairly central, one on the south and the other on the north side of the river. The city hall is placed on rising ground north of the river, a few feet lower than the Houses of Parliament, and presenting from them a fine vista through The Mall and High-street. All the city officials would be housed here, and a large public hall would be provided in the centre of the building. In the City-square the police courts, free library, technical school, banks, and offices would present a fine opportunity for architectural effect.

The commercial and shopping area lies between the city hall and Molonglo River, arcades running between the main streets. The markets are near the centre of the city and on the tram route. Small shopping centres are provided on the outskirts of the city. Sites for offices, banks, and hotels are provided, the chief hotels and pensions being near the central station and facing the lake and gardens near the centre of the city.

The chief residential area is south of the Molonglo River, and west of the railway. The Governor-General's house is placed in grounds of about 100 acres in area to the south of the park and Houses of Parliament, and the Prime Minister's and other Ministers' houses face the west side of the park. The plots are laid out for detached or semi-detached houses, and the size of the plots varied from some 700 ft. square to the labourer's cottage or bungalow with 30 ft. frontage and 140 ft. depth. The building lines vary from 25 ft. to 120 ft., according to the size of the house and depth of building plots. As all houses are detached or semi-detached, no back streets are required save in the shopping areas.

The industrial area is located near the south-eastern entrance to the city between the railway and Jerrabomberra Creek. The chief goods yard or railway marshalling yard is near this point, and as the bulk of the coal and materials coming into the city will be required for industrial purposes, it is a matter of great convenience and economy, and avoids carting through the city. The prevailing winds will take away the smoke without nuisance to the residential area. The gas, electricity, and refuse destructor works, tramway depot and car shed, and Government factories are located in the industrial area, and connected with rails to the goods yard. The cattle market, abattoirs, ice factory, and cold stores are also placed near the goods yard.

The main streets in the Government and commercial areas are generally straight and direct from one important point to another, The Mall, connecting bridge, and High-street, form a continuous straight line between the Houses of Parliament and the city hall; though the view would to some extent be broken by clock towers in the Station-place and at the north end of the bridge. Two boulevards, east and west of The Mall, radiate from Parliament-square, while the city hall is the radiating point for eight streets. The two cathedrals form the focal points of important streets or avenues, and in the smaller squares, crescents, and circuses, the vista is formed by churches or other important buildings. The chief buildings being built on elevated sites are visible from various parts of the city, while good views of the parks and river are commanded from large portions of the district.

The contours of the site are such as to make the gradients of many of the roads somewhat steeper than desirable; but, except in one or two cases, it is possible to get gradients not steeper than 1 in 25; and in the business area the steepest gradient would be one in 40. The main streets and boulevards are laid out of a sufficient width to meet the requirements of the larger population which it is expected the city will ultimately reach, and the sections on Plate No. 2 show that they will be largely laid out as tree-planted boulevards or avenues with grass or gravel margins, or central plots.

In a hot climate such as Australia shelter from the trees is very desirable, while the tree-planted space costs little to lay out, and is always available for throwing into the roadway should the traffic in the future require the widening of the road. The roads have been given a width which may seem somewhat excessive to English ideas; but it must be borne in mind that the land costs nothing, that the city is the capital of a country which is a continent, that suitable road materials may be obtained on the spot, that the revenue from the sale of the land is available for the road making, and that the roads are largely planted with trees, or laid out as lawns. There is, therefore, no reason to adopt the cheeseparing ideas of many of the promoters of Garden City competitions, either with regard to widths or materials for road making.

The principal road, "The Mall," is a fine open boulevard 400 ft. wide. The main feature of this road is the central lawn, 100 ft. wide, laid out with flower beds, fountains, and statuary. Footpaths 25 ft. wide are planted with one row of trees on each side of the 40-ft. roads for slow traffic and service to the Government buildings. Two further strips, each 35 ft. wide, laid out with three rows of trees as avenues or promenades, adjoin the 50-ft. roads on each side of the central lawn. These roads provide space for quick traffic, half of the road being macadam for horses and the other half tar-macadam for motor traffic. The High-street, which is the chief shopping centre, is 200 ft. wide, has 25-ft. footpaths, two 50-ft. roads, and a central tree-planted plot 50 ft. wide, on to which passengers will alight from the tramways. Other shopping streets are 120 ft., 100 ft., and 80 ft. wide, according to the importance of the position and the traffic. In each case a large portion of the streets is taken up by grass and trees, which lend beauty to the streets, provide shade, and save expense in street making. The arcades, which are 30 ft. wide between the shops, would have rolling stairways to transport customers or clients to the shops or offices above the shops on the ground floor. The main ring boulevards are 150 ft. wide with 20-ft. footpaths, two 30-ft. roads, and a central plot 50 ft. wide with 10-ft. gravelled footpaths and 30-ft. grass plot in which the tramways are laid. Trees on the footpaths and on the sides of the tram track make a pleasant avenue. Other roads are 100 ft., 80 ft., 60 ft., and 50 ft. wide, according to requirements and importance. The Park Drive is laid out 150 ft. wide with 25-ft. footpaths, two roads each 30 ft. wide, and a central riding track 40 ft. wide.

Subways, as shown on Plate No. 3, are provided for the Government and main business roadways. Under The Mall and the road east of Pall Mall the main subway is made wide enough for coal trucks drawn by a small electric locomotive, and the pipes are carried above on rolled steel joists. Pipes for water, gas, electricity, and hydraulic power, pneumatic tubes for house refuse, or postal purposes, telegraph and telephone wires, and in the near future, petrol and liquid air, may all be provided for. On the north side of the river the main subway under the High-street is simply a pipe subway, and both main subways give access to the main sewers. Secondary or shallow service subways are provided for pipes on each footway adjoining the shops, and private subways are shown to the Government buildings and clubs.

The main bridge over the Molonglo River and across the lake, shown on Plate No. 4, is 150 ft. wide on plan, though it is actually only 100 ft. wide, as it consists of two 50-ft. wide bridges with an open space 50 ft. wide between them. The roads are connected at intervals of 100 yds. alternately with footways and carriageways carried by arches harmonising with the bridge arches. This arrangement allows the traffic to continue over the bridge in a straight line instead of being diverted by the contraction of the road from 150 to 100 ft., where the bridge and road meet. It gives more light and air to the roads, river, lake, or gardens under the bridge, and lessens the tunnel-like character of the arches of the bridge. It allows a bridge of a somewhat novel and unique type to be constructed at a cost of little more than the 100-ft. wide bridge, while presenting the appearance of a 150-ft. wide bridge. It also affords opportunities for artistic treatment of balustrades, piers, and lamp standards. Pipe subways are placed under the footpaths. Other bridges are 80 ft. and 50 ft. wide, and footbridges are provided at several points over the railway and river.

Tramways are provided to reach the suburbs, and on the ring boulevards they are laid in the grass plot, which not only makes easier running and gives a pleasanter outlook, but saves enormously in the construction and maintenance of the track. The line and levels of the railway were suggested on the plan issued to competitors, and it was only necessary to alter the levels to provide headroom for the roads running under the railway bridges, or the railway under the road bridges. The Central Station is practically in the centre of the city, and suburban passenger stations are placed 1¼ miles north and 1¾ miles south of the Central Station.

The railway marshalling yard or chief goods yard is located at the south-eastern entrance to the city in the midst of the industrial area, and large warehouses are erected there. Small goods yards are placed at the central and northern stations.

Ample provision is made for parks and recreation grounds, and the natural belt of woodland and park on the outskirts of the city will assist in the future development of the city. The chief park is located at the rear of the Houses of Parliament enclosing the hill called Kurrajong, and has an area of about 200 acres. It is well timbered and watered. The trees would be preserved as far as possible, and the watercourses would be made a picturesque feature with waterfalls, ferns, &c., as well as being used for stormwater purposes. A botanic garden, aviary, observatory, shelters, and bridges, with fountains, conservatories, and shrubberies add to the attractiveness of the park. The roads are laid out as avenues for pedestrians, riders, and vehicular traffic. Smaller parks and gardens are provided in various parts of the city, and in the squares, crescents, and circuses, small enclosed gardens are shown. Large ornamental gardens with boating lake, bandstand, fountain, and terrace, are formed near the centre of the city adjoining the river. This land is below the flood-level, and is protected by a broad, tree-planted embankment and roadway. The land below flood-level has practically all been reclaimed and reserved for recreation purposes; the stadium, cricket, football, and golf grounds, military exercising ground, racecourse, and show ground all being located in this area.

The Church of England cathedral has a church house and bishop's residence near to it. The Roman Catholic cathedral has a presbytery and convent school adjoining, and there are churches in suitable situations for the other denominations. A university, high school, technical school, and four elementary schools are provided.

A national theatre and a music hall are situated near the Central Station, and sites for other places of entertainment are provided in other districts. The barracks, gaol and mint are placed near the eastern boundary, and drill halls are located convenient to the military exercise grounds and rifle range. A sanatorium, infectious diseases hospital, general hospital or infirmary, and cottage hospital are provided in suitable situations. Central baths and three open-air bathing places, a cemetery containing three chapels and a crematorium, and a fire station, are also shown.

The Molonglo river is converted into a series of large lakes by impounding the river water by weirs. These hold the water up to such a level that it will make the river suitable for boating and bathing for about 3 miles, though at the same time the levels of the weir are kept sufficiently low to prevent flooding.

There is a considerable fall from the east to the west of the city, and no difficulty should be experienced in providing good falls for the main and other sewers, and avoiding pumping. The northern sewer would have to be carried across the river near the western weir, either by means of an inverted syphon, or by steel pipes supported on cast-iron piles and columns. The sewage disposal works are to be located some 6 miles west of the city. Storm water should be treated separately, and, as far as possible, the natural watercourses should be used for the purpose of storm-water drainage. They all empty into the Molonglo River, and where they run under the roads they will be culverted, or in some cases bridged over.

The collection of refuse from the Government and shopping areas would be by a suction pipe worked from the destructor works by a vacuum pump as described at page 7. The system might be extended to the residential areas, but, if not, carts, vans or motor wagons may be employed. For street watering and garden[illegible] purposes special pipes should be laid in the principal streets, boulevards and gardens.

A longitudinal section to a natural scale of 100 ft. to an inch, which though not reproduced in this paper, it is hoped may be published in the "Proceedings," was given from the Houses of Parliament to the city hall. This drawing showed in section the Houses of Parliament as a domed building in the Classic style, with terraces, gardens and fountains in the Parliament-square and facing the park; elevations of the Government offices; the colonnaded Station-square, with clock tower and Station Hotel; the main bridge over the gardens, lake and river; the banks and shops in the [illegible]-street, and a section through the city hall. The style of architecture suggested for the public buildings was Classic, or the adaptation of it known as Renaissance, and the banks, hotels and business premises were a somewhat freer type of the same style.

In conclusion, the author hopes that the consideration of town planning in the wider and general view which he has attempted to place before the institution, may prove to be of service even to those who are called upon to deal with only a small or partial scheme. The principles which underlie all sound planning are of wide application, and it is the study of these principles, combined with common sense and experience, which can alone produce the ideal town plan.

TOWN PLANNING IN SHEFFIELD.

By C. F. Wike, M.Inst.C.E.,
City Engineer and Surveyor, Sheffield.

Town planning is a subject which has received a considerable amount of attention in Sheffield, both before and since the passing of the Housing and Town Planning Act, 1909. In several instances small areas were dealt with, but owing to the lack of any legislative powers and the unwillingness of the majority of the landowners to co-operate, matters progressed very slowly, until the Act referred to was put into operation, when the Sheffield City Council immediately commenced to take advantage of the provisions contained in the Act. The matter was one which required very careful consideration, and the exercise of the powers of Part II. of the Act was relegated to the Improvement Committee, who appointed a special Town Planning Sub-Committee to deal with the question.

The first step was to decide as to which portion or portions of the city were suitable for town planning schemes. The area of the city is 24,347 acres, and of this about 5,000 acres may be taken as being densely populated, and 2,500 acres sparsely built upon, or, about 7,500 acres which cannot be dealt with under the Town Planning Act. The area not available for building purposes, such as moorland, reservoirs, parks, recreation grounds, precipitous ground, &c., is about 5,000 acres, leaving approximately 12,000 acres of land available for further development, and for inclusion in a town planning scheme.

A key plan was prepared showing this land divided into sections, to enable the committee to decide whether they would forthwith include the whole of the undeveloped land available for building purposes in a town planning scheme, or whether they would deal with it in sections. The latter course was considered the most advisable, and three areas were selected as the most suitable to be dealt with first, the committee's intention being, as the work in connection with these areas progressed, to take in hand other sections from time to time, until the whole of the undeveloped land in the city is included in a town planning scheme.

The three areas in question are: (1) An area in the south-western portion of the city, containing 488¼ acres; (2) an area in the western portion of the city, containing 97 acres; (3) an area in the north-western portion of the city, containing 624¼ acres. A total area of 1,209¾ acres.

As no revision of the 25 in. to the mile scale maps has taken place for the last eight or ten years, during which period the development of the city has been very considerable, it became necessary, in order to comply with the Local Government Board's regulations with regard to the preparation of the various maps, to bring the ordnance maps of these areas up to date. The work was at once put in hand, and the new streets constructed, and buildings erected or in course of erection, were posted on the maps, which undertaking involved a great amount of labour. It was also necessary in some instances to spot level and contour the areas, owing to the hilly nature of the land, for the purpose of showing the feasibility and practicability of suggested new main and secondary roads.

The points to which the committee thought it desirable to give their immediate attention in the earlier stages were: The widths of the existing main roads; the lines and widths of new main and secondary roads; the "set-back" of the main building line; the provision of a satisfactory number of open spaces; the limitation of the number of houses to be built to the acre.

The surveyors to the owners of the large Sheffield estates were invited to inspect the plans, and the owners asked to co-operate with the committee in making the town planning schemes a success. Negotiations were opened, and, except in one or two cases, arrangements have been made satisfactory to both parties, the corporation agreeing to slightly modify their requirements with regard to the number of houses to the acre, set-back, &c., the owners throwing out the necessary land for widening the roads to the widths agreed upon, and the corporation paying for the street works over the width required by the by-

laws—*i.e.*, 40 ft. The widths of roads which the committee consider reasonable and which they have decided upon are, for existing main roads, 80 ft.; secondary roads, 55 ft. and 60 ft.; and subsidiary streets, 40 ft.

NUMBER OF HOUSES PER ACRE.

With regard to the limitation of the number of houses to be built to the acre, it was found impracticable to fix a definite "limit" which would be applicable to all the areas, or even to fix a "limit" for the whole of one area, it being considered advisable to vary the number of houses to the acre in different portions of the areas, according to the class of houses in the district, and the density or otherwise of the buildings adjoining, and as to whether it would develop into a working class or residential district.

In portions of some areas the number of houses to be erected to the acre is to be limited to twelve, these being residential neighbourhoods containing houses of a good class. The houses or cottages already built immediately abutting upon a portion of another area, however, average as many as thirty-five (gross) to the acre, and it would scarcely seem fair or reasonable to fix a "limit" of twelve to the acre for the area adjoining. The committee, therefore, in order to meet the landowners, have decided to accept a "limit" of twenty-four to the acre for this portion of the area, reducing this number as the area withdraws from the overcrowded district; but this is the extent to which they will be prepared to go in any case, and then only when the owners show a disposition to meet them satisfactorily in other ways.

Speaking generally, it may be taken that for residential and good class districts the number of houses to the acre will be limited to twelve, and in areas adjoining working-class districts twenty to twenty-four.

With respect to the set-backs, the following have been agreed upon: Existing main roads, 15 ft.; proposed new main roads, 15 ft.; secondary main roads, 15 ft.; subsidiary streets, 10 ft.; and these set-backs will probably form the basis of agreement when subsequent schemes are taken in hand.

Estimates in connection with these three areas were prepared, these being based on the assumption that the land required for the widenings will be transferred to the corporation without charge, as has already been arranged in several cases.

The areas were referenced, and the requisite notices to the number of about 300 served upon the owners, lessees, and occupiers of the land to be included in the schemes. In this connection it may be stated that the Town Planning Department of the Local Government Board was approached, and agreed that the notices need not be served on occupiers with tenancies of three months or less.

The statutory meeting of owners and others interested in town planning was held on September 6th last, the Local Government Board inquiry being held on January 17, 1912. At this inquiry there were present, in addition to the owners and others interested, a number of prominent officials and corporation members from various towns.

There was comparatively little opposition, and this was not to a town planning scheme in itself, but to some details of the draft scheme which the corporation have submitted to the landowners. The inspector pointed out, however, that the inquiry was only an initial one to consider whether the preparation of a scheme was desirable, and not to consider the methods by which it should be carried out. The Local Government Board have now given the corporation permission to proceed with the preparation of their schemes, the details of which will be gone into at a subsequent inquiry. They insisted, however, on built-up portions of districts within and adjoining the boundaries being ringed out on the deposited plans, so as not to be included in the scheduled areas.

Whilst the preliminary plans had been prepared and the necessary notices served, and pending application to the Local Government Board, the committee decided to proceed with two further areas, one in the north-western portion of the city, containing about 1,300 acres, and another in the south-west containing about 1,750 acres adjoining one of the areas already scheduled.

The total area of the Sheffield town planning scheme therefore is 4,260 acres, which is more than the combined areas of the adjacent towns of Barnsley and Doncaster, and greater than the areas of some towns with populations of approximately a quarter of a million.

The work of posting up the ordnance sheets and contouring the two additional areas is at present in hand, and it is probable that the arrangements as to widths of roads, number of houses to the acre, set-backs, &c., will be on the same lines as in the case of the first three areas.

An attempt has been made by the author of a certain paper on town planning to form a basis of the cost of preparing town planning schemes, worked out at so much per acre. It is scarcely possible, however, to adopt a principle of this kind, as so much depends upon the contour of the district. For instance, it is a very different matter to town plan in a flat city or town than in a place like Sheffield, which is of an exceptionally hilly nature with an altitude varying from 100 ft. to 1,500 ft. above sea level, containing five valleys, and where building development gradually extends up the valleys into the country.

In some towns the populated portions are fairly well concentrated, and the town planner has a free hand, but in cases like Sheffield, where the town and country are intermixed, it is very difficult to get good leading lines of communication. The position and construction of main arterial roads must depend upon the levels and contour of the town itself, and at the same time the natural beauties of the suburbs must be preserved as far as possible.

The cost involved in the posting up of ordnance sheets will also vary in different places according to the growth of the town and the date of the last ordnance survey. Sheffield has grown very rapidly since the ordnance sheets were last revised, the population having increased from 376,160 in 1900 to 459,923 in 1912, and, as previously mentioned, the work of posting up has been very considerable.

DISCUSSION OF MESSRS. PRICE'S AND WIKE'S PAPERS.

Mr. J. W. Cockrill (Great Yarmouth) said Mr. Wike's paper gave them a lot of information on the subject of town planning. In Sheffield they to deal with many problems which in a more level town they would not have. There was much land with which it was impossible to do anything but leave it open. The work done by Mr. Wike was of a very good character, and at West Bromwich a year ago they had the pleasure of seeing the original plans. He moved a vote of thanks to Mr. Wike for his paper.

Mr. W. H. Grieves (Sutton, Surrey), who seconded, remarked that Mr. Wike suggested negotiations with the owners of large estates. Mr. Wike went on to say that, except in one or two cases, arrangements had been made satisfactory to both parties, the corporation agreeing slightly to modify their requirements with regard to the number of houses to the acre, set back, &c., the owners throwing out the necessary land for widening the roads to the widths agreed upon, and the corporation paying for the street works over the width required by the by-laws—*i.e.*, 40 ft. What he would like to ask Mr. Wike was whether the Sheffield Corporation induced everyone concerned to give up the land without paying compensation, because if that was so they had done extremely well. That was going to be one of the great problems with regard to the widening of streets. In a scheme in his district, which was in course of preparation, they wanted the owners to give up a certain width of land on a main road to make it at least 60 ft. wide, but the amount they named was excessive, and they could not possibly consider it. They did not want to use the arbitration part of the Act if they could get the land without. It would be interesting to know if there had been any difficulty of that kind in Sheffield, or whether the owners were persuaded by conciliatory methods to give up the land without paying anything. Their by-laws would not allow a road to be made of less width than 50 ft., but it had been suggested that they might allow owners who were prepared to give up land for the widening of the road to make streets from 30 ft. to 40 ft. wide. He would like to know if any member had had experience of an agreement of that kind. Mr. Wike said it scarcely seemed fair or reasonable to fix a limit of twelve houses to the acre for the area adjoining another area where there were as many as thirty-five houses to the acre, and the corporation had therefore fixed a limit of twenty-four to the acre for that part, which, under the circumstances, seemed a fair thing to do. With respect to the set back of 15 ft. mentioned, he thought it should be 20 ft. or 25 ft.

Mr. E. R. Matthews (Bridlington) said that, according to the paper, a Special Town Planning Sub-Committee of the Sheffield Corporation was appointed to deal with this question. He would like to ask whether

any portion of the town planning area was outside the area of the city, and, if so, whether the rural district council or the council, or both, were asked to appoint delegates to serve on that sub-committee? His own council, who had a town planning scheme before them, were making proposals designed to get rid of the opposition of the rural districts at the outset. They intended to seek the co-operation of three rural district councils, and they would be asked to appoint representatives to serve on the Town Planning Sub-Committee. They also proposed to write to the county council asking them likewise to appoint representatives. In this way they hoped to avoid the opposition of both the rural districts and the county council. Mr. Wike suggested that it was well to divide the portion of the town intended for town planning into sections, taking two or three in hand at first and others from time to time. He would ask Mr. Wike if he still thought that the best plan to adopt. They had a discussion on that point in his own council, and the decision came to was that the whole should be done at once, although fifty years might elapse before part of the area was built upon.

Mr. A. H. Campbell (Edinburgh) moved that Mr. Wike's and Mr. Price's papers be considered together. This was agreed to.

Mr. Campbell, with reference to the question as to how to get owners to surrender their land, thought he was correct in stating that no compensation was payable under the Act. The whole area dealt with in the scheme described by Mr. Wike was within the city of Sheffield.

Mr. T. S. Picton (Eccles) said he would have liked to ask why the new road shown by Mr. Wike was curved, and if the authority considered that the limit of twenty-four houses per acre would have any effect on building operations in the city. In the outskirts of Manchester it was a common practice with owners and builders to erect forty houses per acre, giving 110 sq. yds. to each building, and he did not see how that could be prevented unless each municipality adopted the Town Planning Act. He thought that should be done, for it was not at all desirable to have as many as forty houses to the acre, it was much better to have only twenty-four. He had pleasure in moving a vote of thanks to Mr. Price. It showed how carefully Mr. Price, senr., had trained his son when they saw the remarkable ability displayed by young Mr. Price in connection with the scheme for laying out the federal capital of the Australian Commonwealth. When they had juniors who showed such ability as this municipalities need not fear to appoint them to succeed older men. He could not say, however, that he saw eye to eye with Mr. Price in putting down a tramway track on grass plots. In Lancashire towns that certainly would not do at all; it would mean such an awful expense.

Mr. A. H. Campbell (Edinburgh) seconded the vote of thanks, remarking that it was well they had such a junior member capable of taking so admirable a discussion of town planning. He had not heard whether this plan was premiated or not, but it certainly deserved a premium if it did not get one. It was gratifying that town planning had been given such prominence at the last four annual meetings of the institution, culminating in the successful conference at West Bromwich last year. He hoped the question would for many years continue to form an important part of their programme at the annual meetings. They were only on the threshold of it, and the more they went into it the greater would be found the possibilities of the Act in the direction of furthering the good government and improved administration of the large cities and towns. The Act of 1909 formed a renaissance in public health legislation. It comprehended not merely public health in the narrower interpretation of the phrase, but public health as involved in the whole question of governing an urban community. It dealt not only with city improvements, but with the widening of city main roads, the construction of new intercommunicating ways between distant parts of cities, with the distribution of population, and the relieving of that congestion which was found in all big urban communities by spreading the people over the less-built-up areas. It also enabled them to create open spaces and conserve the amenities of their towns. Consider what it meant with regard to everything affecting the good government of their cities. Formerly, if they went to Parliament, they were faced with [illegible] and how little that was new they could get into local legislation, because, usually, said there was "no precedent" for it. Then, if there was a precedent of ten, twelve or fourteen years back, they would say, "We are not granting this to-day, because we are so advised by the central authority." He was glad to see that now the central authority had surrendered to the pressure of local opinion, as voiced by the municipality. The Association of Municipal and County Engineers, about the year 1907, had as one of the subjects for discussion that of "Town Planning." That brought the question to the front, and induced Mr. Burns to go forward with this new birthright for the municipalities of the country. The point mentioned by Mr. Matthews about overlapping authorities was an important one. They in Edinburgh were experiencing that. It was a pity that there should be such rivalry and unneighbourliness between authorities as to prevent the carrying out of what would be for the benefit of all the authorities concerned; and he deprecated the setting up of rival plans and schemes to the detriment of the common good. He hoped the prevailing tendency in the future would be to refuse to countenance rival schemes and to institute joint authorities, so that coalition would take the place of rivalry, and co-operation of hostility. Mr. Price dealt with the case of an entirely new town, and he congratulated him on his work. That brought him to another aspect of the question. They who hailed from Scotland had the satisfaction of knowing she was going to lead in town planning in the United Kingdom. There were 7,000 acres ready for planning in connection with the development of Rosyth, and the Admiralty was pushing the authorities along with all possible speed. In the course of a few years a stretch of country which was now green fields would have a population resident upon it of from 40,000 to 50,000, who would be—he would not say aliens—but from the Midlands and the South. He was glad to say that the gentleman who was carrying out that scheme was English—from Mr. Stilgoe's office. Mr. Wike was applying himself with all the energy and knowledge derived from his experience to his task, and he was going to lay out there an absolutely new area to receive these guests from the South. Well, all of them had not these 7,000 acres or federal capitals to deal with, but they all had their plots to till, and therefore let them not be discouraged. Each of their small towns presented opportunities for the consideration of the same developments, and the same problems as if the area were ten or twenty times as large.

Sir James Lemon (Southampton) said the objects of town planning were twofold—to prevent slums in the future and to provide better housing in the suburbs, and to get direct communication with the main roads in the surrounding districts. He happened to know three estates with a good road running round the three of them, and the owner of the centre block proposed to lay out his land and wanted the other two owners to join with him so as to get through roads. The other two said, "We are not in a hurry. You develop your land first, and then we will have a go." Under the Town Planning Act that would be prevented, and all three estates would be developed. As regarded the width of roads, Mr. Wike got over the difficulty pretty well. It was a great step in advance to have a road 80 ft. wide; they never thought of such a thing some years ago. He knew he had great difficulty in getting roads 40 ft. wide. After most of the owners had been induced to go beyond 40 ft., there would be one obstinate owner who would not budge, but the difficulty in his case was got over by an agreement to put a good forecourt to the houses. He got one gentleman to make a road 50 ft. wide, and as there was a forecourt in that case of 10 ft. or 12 ft., they got a total width of practically 70 ft. What they wanted was really not so much a great width of road as a great width between house and house. He had laid out an estate on which the owner wished to put as many houses as possible, and he persuaded him to give a road which, with the forecourts on each side, brought the total space between the houses up to 100 ft. When they met with landowners who would not increase the width of the road so much as they thought they ought to do, the difficulty might be got over in that way. The suggestion was a good one that, when local authorities wanted a greater width dedicated to the use of the public, they should pay for making up the increased width above what the owner wanted to give. By all means come to an agreement if it were possible to do so, for if they had to go to arbitration it would be a very expensive matter. He believed if they negotiated with the owners in a reasonable spirit they would not have much difficulty in increasing the width of roads as much as they wished. With regard to the number of houses, he

considered twenty per acre the maximum under any conditions whatever; indeed, he went further than that, and said that twelve would be much better. They wanted to spread their towns out, not to have a lot of houses crowded on a small area.

Mr. W. Stubbs (Blackburn) considered the scheme described by Mr. Wike as suitable for a large manufacturing town. The limit of twenty houses per acre was a very reasonable one. In Blackburn the present by-laws would not permit more than twenty-six per acre. As to the width of roads, he thought it was a mistake to make the roads too wide, as they could get a forecourt as suggested by Sir James Lemon. He did not agree with the suggestion to spread the laying out of the area over fifty years. He thought it was a mistake to do that, especially in parts of the country where there were many owners, as in Lancashire. Another suggestion he did not agree with was for keeping works separate from houses. How was a working man who was in receipt of 25s. a week to get to work? Was he to pay 5s. or 6s. a week in tram fares? If they were going to have healthy working classes they must provide in town planning schemes for the working man, but so far as it had gone it did not provide for the working man. A man must have 35s. or 40s. per week to live in the houses provided under town planning schemes.

Mr. W. L. Carr (Ruislip-Northwood) said, with reference to the Ruislip scheme, which had aroused some interest, he might say that at the last meeting of his council the draft scheme was approved. It was proposed to deal with the widening of roads, also with the question raised by Mr. Matthews, of Bridlington. They had a road outside their district, and he was pleased to say though they had an objection from the rural district council, the Local Government Board overruled that objection, and they had now come to an agreement without any committee of the two councils being formed. The question of factory areas, shop areas, and open spaces were all dealt with. He would also be able to show them the several agreements entered into with the landowners, which dealt with the width of the roads. With regard to Mr. Wike's paper, he would like to ask whether it was proposed to frame general provisions with regard to the area mapped out. In his opinion it was not necessary to do that. He would also like to know how it was proposed to deal with the limitation of the number of houses per acre. The question of setting back they dealt with in a slightly different manner at Ruislip to that described by Mr. Wike, and he thought their method was preferable.

Mr. T. Adams (Town Planning Inspector of the Local Government Board) said the discussion had helped him to understand some of the difficulties which the surveyors of local authorities had to contend with. He hoped every member of the institution who had a town planning scheme on the stocks would take the opportunity offered of seeing Mr. Carr's plans. There were in connection with town planning schemes a great many difficulties to be encountered. The question of outside areas had been alluded to by Mr. Matthews, and in connection with that he might point out it was possible under the Act; indeed, it was of the very nature of town planning to provide in their scheme for getting control over an adjoining rural area. Regarding the width of roads, a surprising statement was made to him in the course of an inquiry which tended to show the existence of certain injustices in regard to the standard width. It was that 75 per cent of the area concerned could do with a less width than was asked for, but that a width of 45 ft. was insisted on in order to get something in return. He hoped that surveyors, in preparing town planning schemes, would always draw a skeleton plan showing the arterial roads and other main roads required. Mr. Wike showed in his scheme he was not only prepared to deal on practical lines with the needs of the moment, but had considered how Sheffield was going to grow in the future. That was a natural scheme, for they desired to town plan not only for those who migrated to the South, but also for those in the crowded cities of the North. It was hardly fair to say that the Town Planning Act was encouraging the building of houses suitable for others than members of the working classes. There was a great deal of misapprehension on the point. Town planning was one thing; schemes like Letchworth were another thing altogether. Town planning dealt with undeveloped areas of towns and cities, and naturally the housing of the working classes was an important part of this. They could not deal with any large area in a city like Sheffield unless they made provision for housing the working classes as well as others. That was a point which it was necessary to remember—that the housing of the working classes was an important element in all town planning schemes, and particularly in schemes where the width of the roads was a consideration. Wide arterial roads were not roads in which they could economically house the working man; therefore, it was a serious matter to be providing these arterial roads which had to be paid for very largely out of public funds. This question of working-class accommodation should be taken into very serious consideration.

The President said they had had a most interesting discussion on two admirable papers, one from a veteran, and one from a coming municipal engineer.

The vote of thanks having been unanimously accorded,

Mr. Price thanked Mr. Picton and the other speakers for their kind words about the paper. Mr. Picton said something about the grass plots for the tramways. The cost of upkeep would not be very much, and the picturesqueness would make up for any expense that would be incurred.

(To be continued.)

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Thomas Cole,
Secretary.

11 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, Assoc.M.Inst.C.E., Borough Surveyor, Windsor.

SOUTH-EASTERN DISTRICT.

The third annual district meeting will be held at 39 Victoria-street, Westminster, on Wednesday, August 7th, at 7.30 p.m.

The business to be transacted at the meeting is as follows: To consider annual report; to elect district chairman; to elect honorary district secretary; to receive offers of papers for discussion.

J. W. Brook,
Hon. District Secretary.

352 Central Park-road,
East Ham.

SOUTHERN DISTRICT.

The third annual district meeting will be held at 39 Victoria-street, Westminster, on Wednesday, August 7th, at 7.30 p.m.

The business to be transacted at the meeting is as follows: To consider annual report; to elect district chairman and honorary district secretary; to receive offers of papers for discussion.

E. W. Veale,
Hon. District Secretary.

Frensham,
Surrey.

COUNCIL MEETING.

At a meeting of the council held on July 24th the following applicants were recommended for admission.

To Membership: Messrs. John Morley, surveyor and Engineer, Ardsley Urban District Council; H. W. Lockton, deputy borough surveyor, Newark; W. H. Scott, assistant surveyor, Ruislip-Northwood Urban District Council; and W. W. Earwaker, sanitary surveyor, St. Columb Rural District Council.

To Associate Membership: Messrs. W. A. Walker, surveyor's office, Stourbridge; J. C. Stevenson, assistant surveyor, Ulverston Urban District Council; S. Grisdale, district main road surveyor, Cumberland County Council; S. L. Kumar, Public Works Department, Punjab, India; and R. U. Harper, assistant

highway surveyor, Chester-le-Street Rural District Council.

Transfer to Membership: Mr. W. H. Butler, assistant county surveyor, Cumberland.

Transfer to Associate Membership: Messrs. J. H. Marsh, surveyor's office, Worsley Urban District Council, and A. R. Chicas, assistant city engineer, North Vancouver, B.C.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

New Members, &c.—From the applicants recommended for admission at the last meeting two members and four associate members were elected, and one transfer was made to the membership class. One student was elected.

Premiums for Papers.—The consideration of papers presented by members of the institution will take place at the September council meeting, with a view to awarding the premiums already announced.

Nominations.—Forms for the nomination of members for the council, 1912-13, are now ready and may be obtained on application. These forms must be returned to me, duly filled in, not later than August 20th.

Town Planning.—Mr. W. Louis Carr has kindly extended invitations to members to view his Town Plan—Maps No. 4 and 4a, with General Provisions. They may be seen at his offices, Northwood, Middlesex.

Nominations.—Mr. Frank Latham was nominated president and Mr. Thos. Mundy honorary treasurer for the year 1912-13. The nominations for vice-presidents will be announced later.

B. Wyand,
Secretary.

39 Victoria-street, S.W.
July 25, 1912.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

CLERK OF WORKS.—August 3rd. Corporation of Hyde. £3 per week.—Mr. T. Brownson, town clerk.

ROAD FOREMAN.—August 3rd.—Kirkcaldy Town Council. 35s. per week.—Burgh Surveyor.

TEMPORARY ASSISTANT.—August 3rd.—Corporation of Richmond (Surrey). £3 per week.—Mr. J. H. Brierley, borough surveyor.

TEMPORARY ASSISTANT.—August 5th.—Easington Rural District Council. £3 per week.—Mr. G. Waterhouse, Easington, Durham.

CLERK OF WORKS.—August 5th.—Chesham Urban District Council. £2 10s. weekly.—Mr. P. C. Dormer, engineer and surveyor.

CLERK OF WORKS.—August 6th.—Breconshire Education Committee. £2 10s. per week.—Mr. C. W. Best, County Hall, Brecon.

CLERK OF WORKS.—August 7th.—Matlock Urban District Council. £4 4s. per week.—Mr. R. Taylor, clerk. Prescribed application forms can be obtained on application to Messrs. James Diggle & Son, engineers, 14 Victoria-street, London, S.W., and Hindhill-street, Heywood, Lancs.

CLERK OF WORKS.—August 8th.—Abersychan Urban District Council. £2 10s. per week.—Mr. W. H. V. Bythway, clerk.

CLERK OF WORKS.—August 9th.—Newport Pagnell Rural District Council.—Mr. Charles W. Powell, clerk.

SURVEYING ASSISTANT.—August 10th.—Borough engineer's office of a large Midland town. £130.—Box 1,174, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

TEMPORARY TRAMWAY ASSISTANT.—August 10th.—Engineer's office of large Midland town. £140.—Box 1,175, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

ASSISTANT SURVEYOR.—August 10th. Rothwell Urban District Council. £65 per annum.—Mr. W. Dodgson, clerk.

CLERK OF WORKS.—August 10th.—Corporation of Northampton. £1 per week.—Mr. A. Fidler, borough engineer.

ASSISTANT IN SURVEYOR'S OFFICE.—August 20th. Hemsworth Urban District Council. £78 per annum.—Mr. Thomas Robey, clerk.

ASSISTANT ENGINEER.—August 31st.—Darjeeling Municipality, India. 150 rupees monthly.—The Chairman.

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

CLERK OF WORKS.—Surrey County Council.—Mr. A. Dryland, county surveyor, County Hall, Kingston-on-Thames.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

CARDIFF.—August 6th.—Designs and estimates for fire station.—The Town Clerk.

GOOLE.—September 1st.—Competitive designs and estimates for municipal offices, for the urban district council. Two premiums (£30 and £15).—Mr. R. Tyson, clerk.

CHORLEY.—September 9th.—Designs for a school, for the corporation.—Mr. J. Mills, town clerk.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas.—Mr. J. Henry Field, town clerk.

RANGOON.—Designs for the new municipal buildings. Honorariums of £300, £200 and £100 are offered.—Messrs. Ogilvy, Gillanders & Co., Sun-court, 67 Cornhill, E.C.

MUNICIPAL CONTRACTS OPEN.

Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

HAMILTON.—August 5th.—For the erection of new municipal offices, for the corporation.—Mr. P. M. Kirkpatrick, town clerk.

SOMERSET.—August 6th.—For the erection of an infants' school, for the county council.—Mr. C. H. Bothamley, secretary, Weston-super-Mare.

HUNGERFORD.—August 6th.—For the erection of workmen's dwellings, for the rural district council.—Mr. W. S. Raine, surveyor.

DUNGANNON.—August 6th.—For the erection of twenty-four houses, for the urban district council.—The Clerk.

CHESHAM.—August 7th.—For the construction of an open-air swimming bath, for the urban district council.—Mr. P. C. Dormer, engineer and surveyor.

STAMFORD.—August 8th.—For the erection of a swimming bath, for the corporation.—Mr. F. R. Ryman, engineer.

BARNSLEY.—August 8th.—For building new waterworks offices, for the corporation.—Mr. J. H. Taylor, borough surveyor.

WEST RIDING.—August 9th.—For the erection of a school at Silsden, for the Education Committee.—Education Architect, County Hall, Wakefield.

WARRINGTON.—August 9th.—For the supply of tubed dadoes, heating installation, ventilation, sanitary goods, and electric lighting at school, for the corporation.—Mr. J. Moore Murray, clerk to the Education Committee.

HANTS.—August 9th. Alterations at St. Mary Bourne School, for the county council. Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

SHEFFIELD.—August 9th.—For the erection of fifty-five cottages, for the corporation. City architect.

ABERDARE.—August 10th.—For the erection of thirty-two tenement dwellings, for the urban district council.—Mr. T. Phillips, clerk.

HUNTS.—August 10th.—For the enlargement of a secondary school, for the Education Committee.—Mr. S. G. Cook, clerk, County Education Offices, Huntingdon.

WOMBWELL.—August 10th.—For the erection of public baths, for the urban district council.—Mr. P. M. Walker, clerk.

KINGSTOWN.—August 10th.—For the erection of baths and wash-houses and caretaker's house, for the urban district council.—Mr. J. Sherlock Vaughan, town clerk.

MERTHYR.—August 12th.—For the erection of forty-eight dwellings, for the corporation.—Borough Architect, Town Hall.

TAVISTOCK.—August 13th.—For the construction of works of water supply, for the rural district council. —Mr. A. Kenneth G. Johnstone, clerk.

BARNSTAPLE.—August 15th.—For works at Knowle Braunton, including reinforced reservoir, and water main, for the rural district council.—Mr. R. E. C. Balsdon, clerk.

SOUTHEND.—August 17th.—For the erection of a lodge and refreshment-room, for the corporation. Mr. E. J. Elford, borough engineer and surveyor.

HANTS.—August 19th.—For the erection of a classroom, for the county council.—Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

CHELMSFORD.—August 28th.—For the extension of the fire engine station, for the corporation.—Mr. W. Smith, town clerk.

WEYBRIDGE.—For the erection of new head post office and telephone exchange, for H.M. Works and Public Buildings.—Secretary, H.M. Office of Works, Storey's-gate, London, S.W., endorsed "Tender for Weybridge New Head Post Office."

Iron and Steel.

LANARK.—August 3rd.—For the supply of 1,700 tons of 15 in. diameter cast-iron pipes and special castings, for the Middle Ward District Committee.—Mr. J. McMillan, water engineer, District Offices, Hamilton.

LYMM.—August 7th.—For the supply of 1,100 yds. of 6-in. socket and spigot pipes, and 6-in. specials, for the urban district council.—Mr. W. Ward, clerk.

SOUTHAMPTON.—August 10th.—For the supply of straight steel pipes and specials, for the corporation.—Town Clerk.

BOMBAY.—For the supply of 20 miles of steel pipes of about 48 in. diameter, for the municipality.—Mr. H. J. Trivess Smith, hydraulic engineer, Municipal Offices, Bombay.

Roads.

BOLLINGTON.—August 5th.—For the supply of 300 tons of granite macadam, for the urban district council.—Mr. S. Knight, clerk.

SKIPTON.—August 5th.—For kerbing, channelling, paving and making up, for the urban district council. —Mr. Richard Wilson, clerk.

LANCHESTER.—August 6th.—For tar-grouting work, for the rural district council.—Mr. W. Cumming, highway surveyor.

CHINGFORD.—August 6th.—For making-up work, for the urban district council.—Mr. L. C. Bowen, clerk.

SUNBURY-ON-THAMES.—August 6th.—For the supply of granite, for the urban district council.—Mr. H. F. Coales, surveyor.

BARNSLEY.—August 7th.—For draining, levelling, metalling and flagging, for the corporation.—Mr. J. Henry Taylor, borough surveyor.

CORK.—August 7th.—For surfacing a cobble-paved street, for the corporation.—Mr. D. F. Giltman, clerk of committees.

KESTEVEN (Lincs).—August 7th.—For steam rolling and scarifying, for the county council.—Mr. W. B. Purser, county surveyor, Grantham.

BUNGAY.—August 8th.—For the supply of Mountsorrel or Quenast granite, for the urban district council.—Mr. P. J. Sprake, clerk.

BARKING.—August 8th.—For the supply of 500 tons of Norway granite setts, for the urban district council.—Mr. H. Hargreaves, clerk.

KINGSTOWN.—August 10th.—For the construction of a new road, for the urban district council.—Mr. J. Sherlock Vaughan, town clerk.

WEST SUSSEX.—August 10th.—For the supply of six or more tar-spraying machines of 250 gallons capacity, for the county council.—Mr. H. W. Bowen, county surveyor, 23 North-street, Horsham.

DONCASTER.—August 12th.—For work of road widening, for the rural district council.—Mr. W. R. Crabtree, surveyor.

ISLE OF WIGHT.—August 21st.—For the supply of 2,300 tons of quartzites, basalts, syenites or granites, for the rural district council.—Mr. H. Eldridge Stratton, clerk.

DROYLSDEN.—August 21st.—For private street works, for the urban district council.—Mr. Charles Hall, surveyor.

HERNE BAY.—August 21st.—For making up and paving, for the urban district council.—Mr. F. W. J. Palmer, surveyor.

BURNLEY.—August 24th.—For paving and making up, for the rural district council.—Mr. H. Prichard, surveyor.

CHICHESTER.—August 29th.—For making up with granite macadam about 10,000 super. yds. of London-Portsmouth road, for the corporation.—Mr. J. W. Loader Cooper, town clerk.

CASABLANCA.—August 29th.—For the improvement of several roads, for the Special Committee of Public Works.—The President, Comité Special des Travaux Publics, Dar En Niaba.

EAST BARNET.—August 29th.—For the supply of broken granite, gravel, hoggin, Portland cement, stoneware pipes, tar-paving materials, oats, hay, straw, horse hire and cartage, for the urban district council.—Mr. T. A. Buckley, clerk.

CASABLANCA.—August 31st.—For the construction of public roads, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

LOUGHTON.—August 31st.—For the supply of granite, gravel and hire of steam roller, for the urban district council.—Mr. H. White, surveyor.

Sanitary.

GLASGOW.—August 3rd.—For work of sewerage, for the corporation.—Mr. J. Lindsay, town clerk.

COCKERMOUTH.—August 3rd.—For laying a surface drain, for the rural district council.—Mr. J. H. Musgrave, clerk.

ASHINGTON.—August 6th.—For scavenging work, for the urban district council.—Mr. C. Alderson, clerk.

CARLISLE.—August 6th.—For the construction of a 6-in. sewer, for the rural district council.—Mr. F. Barker, surveyor.

BEDLINGTON.—August 6th.—For the construction of sewers and manholes, for the urban district council. —Mr. J. E. Johnston, surveyor.

TINTWISTLE.—August 7th.—For the construction of sewage disposal works, for the rural district council.—Mr. D. Pennington, clerk.

OLDHAM.—August 7th.—For the supply of 200 wash-down water-closets, cisterns and fittings, for the corporation.—Borough Engineer.

OLDHAM.—August 7th.—For the construction of six percolating filters, ejector chamber, excavation and contingent works, for the corporation.—Borough Surveyor.

TONBRIDGE.—August 7th.—For the construction of a stoneware pipe sewer and manholes, for the rural district council.—Mr. F. Harris, engineer.

ROCHDALE.—August 7th.—For sewering work, for the corporation.—Borough Surveyor.

TAMWORTH.—August 8th.—For the construction of pipe sewers, manholes, septic tanks, and circular percolating bed, for the rural district council.—The Clerk.

ATCHAM.—August 8th.—For the construction of 5,400 yds. of sewer, for the rural district council.— Mr. H. Asher, surveyor, 24 St. John's-hill, Shrewsbury.

DONCASTER.—August 9th.—For the construction of surface-water drains, for the rural district council.— Mr. W. R. Crabtree, surveyor.

EAST ASHFORD.—August 12th.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. Julius Kingsford, clerk.

DARTFORD.—August 12th.—For supplying and laying about 6 miles of stoneware pipes, manholes and appurtenant works, for the rural district council.— Mr. Eustace J. Hobbs, clerk.

DONCASTER.—August 12th.—For laying storm-water earthenware pipe drain, for the rural district council.—Mr. W. R. Crabtree, surveyor.

CHAPEL-EN-LE-FRITH.—August 13th.—For the construction of sewage disposal works, for the Whaley Bridge Joint Sewerage Board.—Mr. J. B. Boycott, clerk.

BUDLEIGH SALTERTON.—August 13th.—For the construction of 800 lin. yds. of 9 in. diameter stoneware-pipe sewers, manholes, and flushing chambers, for the urban district council.—Mr. Chas. T. K. Roberts, clerk.

ETON.—August 14th.—For scavenging at Iver, for the rural district council.—Mr. H. L. C. Barrett, clerk, Slough.

RAMSBOTTOM.—August 15th.—For works of sewerage and the construction of sewage disposal works, for the urban district council.—Mr. John W. Barlow, clerk.

GATEHOUSE-OF-FLEAT.—August 15th.—For the execution of a drainage scheme, for the corporation.—Mr. W. F. Crombie, 122 Irish-street, Dumfries.

COCKERMOUTH.—August 15th.—For the construction of 4,300 yds. of twenty 4-in., 9-in., 6-in. and 4-in. sewers, manholes, flush tanks, ventilators, tanks and filters, for the rural district council.—Mr. J. H. Musgrave, clerk.

LINTHWAITE.—August 16th.—For the construction of sewers and manholes, for the urban district council.—Mr. D. J. Bailey, clerk.

DISLEY.—August 17th.—For the construction of sewers, for the rural district council.—Mr. E. N. Davenport, clerk, Park Chambers, Vernon-street, Stockport.

YEARDSLEY-CUM-WHALEY.—August 17th.—For the construction of sewers, for the urban district council.—Mr. S. Taylor, clerk, 9 Terrace-road, Buxton.

MACCLESFIELD.—August 17th.—For the construction of sewers, for the rural district council.—Mr. F. May, clerk.

HALIFAX.—August 17th.—For the construction of cast-iron pipe sewer and appurtenances, for the Highways Committee.—Mr. J. Lord, borough engineer.

CHAPEL-EN-LE-FRITH.—August 20th.—For the construction of new sewers, for the rural district council.—The Clerk.

CHELTENHAM.—August 31st.—For the construction of nine combined circular sewage tanks in three sets, and eight percolating filters 101 ft. in diameter, with roads, drains, and conduits, for the corporation.—Mr. J. S. Pickering, borough engineer.

BRADFORD.—September 3rd.—For the erection of twenty-eight sludge filter presses at Esholt, for the corporation.—Mr. Frederick Stevens, town clerk.

WALMER.—September 4th.—For the construction of concrete tube and stoneware sewers and surface-water drains, for the urban district council.—Mr. F. W. Hardman, clerk.

Stores.

ABERCARN.—August 3rd.—For the supply of various gas stores, for the urban district council.—Mr. J. A. Brentnall, engineer and manager.

Miscellaneous.

HEYWOOD.—August 12th.—For the supply of tubes and fittings, sulphuric acid, and tinned ware, for the Gas Committee.—Mr. Geo. G. Boucher, town clerk.

SOUTHWELL.—For the supply of non-poisonous dust preventives, for the rural district council.—Mr. H. Blewitt, district surveyor, Ollerton, Notts.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

BATTERSEA.—For erecting a handicraft workshop at premises in Latchmere-road, Battersea, temporarily occupied by the Battersea Polytechnic Secondary Day School, for the London County Council:—

Maxwell Brothers, Limited, Brixton-road	£995
J. Marsland & Son, Walworth	871
J. Appleby & Sons, Southwark Park	822
J. Ford & Sons, Fitzalan street	808
H. H. Hollingsworth, Peckham	789
Rice & Son, Stockwell-road	727
Trigge & Co., Clapham	698
Lole & Co., Chelsea	684
J. & C. Bowyer, Limited, Upper Norwood †	682

Architect's estimate, £694

BETHNAL-GREEN.—For improving the means of exit at the Globe-terrace School, Bethnal-green, for the London County Council:—

W. Bailey, Pelton-road	£340
Parrott & Isom, Fore-street	629
G. Munday & Sons, Eastcheap	628
A. E. Symes, Stratford	620
Vigor & Co., Poplar	587
H. C. Horswill, Forest-gate†	583

Architect's estimate, £560.

EARSDON.—For laying earthenware sewer, for the urban district council.—Mr. J. R. MacMillen, surveyor:—
G. Armstrong, Whitby Bay.

ELLESMERE PORT.—For making-up certain streets, for the urban district council:—
Private Street Works.—J. Shelton, Ellesmere Port, £1,548.
Cemetery Chapel, &c.—J. Jones, Ellesmere Port, £1,719.
Sewer. J. W. Flather, Ellesmere Port, £857.

HENDON.—For the Golder's Green and other road improvements, for the urban district council.—Mr. S. S. Grimley, engineer:—

Patent Impervious Stone Company, Hammersmith	£10,209
T. Adams, Wood-green	10,179
W. Muirhead & Co., Limited, Queen Victoria-street	10,088
J. Mowlem, Westminster	9,606
R. Ballard, Child's-hill	9,638
W. Griffiths, Bishopsgate	9,546
F. G. Brummell, Willesden	9,543
H. Farrow, Brixton *	9,318
H. Woodham & Sons, Catford (withdrawn)	8,887

HENDON.—For the erection of a public mortuary and other buildings, for the urban district council.—Mr. S. S. Grimley, engineer and surveyor:—

Mortuary.

W. Tout, Hendon	£929
W. Moss & Sons, Loughborough	850
F. Gough & Co., Hendon	832
E. W. Hall, Finchley*	696

Other Buildings.

F. Gough & Co., Hendon	£323
W. Tout, Hendon†	313
F. King, Hendon*	294

* Accepted for shedding at depot and bicycle store, £233.
† " " shed at Child's Hill Recreation Ground, £55.

HUNSLET.—For making up private streets, for the rural district council:—

H. C. Pullar, Wakefield	£235
G. L. Briggs & Son, Leeds *	197

KINGSTON.—For the widening of Kingston Bridge, for the Joint Committee representing the Surrey and Middlesex County Councils:—

	Tender A‡.	Tender B§.
W. Scott & Middleton, Limited †	£59,730	£64,230
Mowlem & Co., Limited	63,000	67,500
Mitchell Brothers, Limited	64,544	67,806
Head, Wrightson & Co., Limited	68,000	71,950
Sir W. Arrol & Co., Limited	69,987	73,413
Perry & Co.	83,390	83,000

‡ The tender A provides for foundations being constructed partly by caisson and partly by cofferdam.
§ The alternative tender B provides for foundations being constructed wholly by caisson.
In each instance £5,000 is allowed for contingencies.
Mr. Basil Mott's estimate, with an allowance of £9,300 for contingencies, was £71,300.

KINGSTON-UPON-THAMES.—For the supply of granite kerb, channelling, setts, and cubes and quadrants, for the corporation.—Mr. R. H. Cincas, borough surveyor:—
Devon Basalt and Granite Company, Exeter.
Fry Brothers, Greenwich.
Enderby and Stoney Stanton Granite Company, Limited, Leicester.
W. Griffiths & Co., Limited, Bishopsgate.
A. & F. Manuelle, Gracechurch-street.
Brookes, Limited, Westminster.
G. Dixon, Dublin.
Wettern Brothers, London*
Separate prices quoted for each class of material.

LONDON.—For the provision of pumping machinery at the southern outfall works, for the London County Council:—

Rees Roturbo Manufacturing Company, Wolverhampton	£6,050
Fullerton, Hodgart and Barclay, Paisley	6,000
Drysdale & Co., Limited, Glasgow	5,350
(alternative tender)	6,250
(alternative tender)	5,850
J. Cochrane, Glasgow†	4,835
(alternative tender)	4,915

NEWPORT PAGNELL.—Accepted for laying cast-iron and stoneware sewers, and the construction of sewage disposal works, for the rural district council:—
A. H. Price & Co., Nottingham, £11,515.

NORTH DARLEY.—For the supply of granite, for the urban district council.—Mr. E. F. Lowe, surveyor:—
T. Wright, Matlock.
F. Hodson & Son, Nottingham.
United British Basalt Company, Buxton.
Mountsorrel Granite Company, Leicester.
Penmaenmawr Granite Company, Penmaenmawr.
Cliffe Hill Granite Company, Leicester.
United Stone Firms Limited, Bristol.
Whitwick Granite Company, Leicester.
Croft Granite Company, Leicester.
Enderby and Stoney Stanton Company, Leicester.
Ellis & Everard, Leicester,* £497.

NORTHUMBERLAND.—For the erection of a secondary school, for the Education Committee:—
J. F. Newbold, North Shields, £11,047.

ROMSEY.—For building a bridge at Plaitford, for the rural district council:—

C. Rogers & Co., King's Somborne	£180
F. Hurst, Awbridge *	144

The Surveyor

And Municipal and County Engineer.

Vol. XLII. AUGUST 9, 1912. No. 1,073.

Minutes of Proceedings.

Herefordshire Roads.

The annual report on the roads of Herefordshire, prepared by Mr. G. H. Jack, the county surveyor, presents in forcible and eloquent language a somewhat grim array of facts relating to the difficulties of highway administration and engineering in that county. The extracts which will be found on another page relate partly to administrative matters, and these passages suggest very strongly some of the chief weaknesses of the present system of organisation and control of highways. Of even greater immediate interest are the passages relating to engineering difficulties, with regard to which the natural conditions of the county must be taken into consideration before the reader living in a different part of the country indulges in mental comment. The position which Mr. Jack takes up on the subject of surface tarring, for instance, is due partly to the climate of Herefordshire, partly to the nature of the soils on which many of the roads run, and is no doubt to some extent the result of the fact that the crusts of the roads are at present, to a very large extent, in such a condition and of such small thickness that surface tarring is far less effective than it is on roads of greater strength and on firmer subsoils. Conditions tending to surface tarring, and opinions as to the extent to which it preserves the road, will be found to alter steadily as we pass from the south-eastern and eastern counties in a westerly or north-westerly direction, and the county surveyors of Surrey and Kent, for instance, are warranted in taking up an attitude in this matter which is very different from that taken up by county surveyors of Staffordshire and Herefordshire.

Looking at the conditions broadly, we find a number of differences each of which tends to the same result, and all of which, taken together, have a very marked influence. Comparing, for instance, Hereford with Kent, we find that the rainfall over the greater part of the former county exceeds 30 in. a year, and in parts the fall approaches or exceeds 35 in. Over the greater part of Kent the rainfall is less than 30 in., and in some parts it is less than 25 in., per annum. During January, February and March the difference is small, but perhaps considerable. It is greater from April to June, and in the specially important month of May it is very marked. Add to this that the temperature of Herefordshire is somewhat lower, the amount of sunshine considerably less, and the influence of these factors in the matter of road tarring will be realised. Geologically the circumstances are in favour of the south-eastern county, which is mostly on the Cretaceous system with some Eocene strata, while the greater part of Herefordshire is on the Old Red Sandstone system. The opinion may be hazarded that the Weald clay is, from the present point of view, a far less troublesome subsoil than the red marl of Herefordshire. A stiff clay—especially when the road between fences is wide enough to permit of its proper management—is probably a much better soil than a somewhat retentive marl which holds a larger proportion of the rain falling upon it or water flowing over it. It is not always realised by the "duck's back" school of armchair engineers that a waterproof film which prevents water from entering a road crust from above may also prevent water from drying off through the crust and may actually imprison that which enters from the side or from below. On a retentive marl the difficulties of drainage may be considerably increased by the use of waterproof surfacings or waterproof crusts. Apart from all this, a strong crust, true to shape, is especially necessary in the case of surface tarring, which, when a weak crust begins to form undulations, prevents adjustment by surface attrition and effectually checks the self-grouting on steep slopes which is an element of considerable importance on many by-roads and secondary roads.

The cumulative effects of surface-tarring cannot, of course, be attained on roads which churn up during the winter, and it is safe to say that it is now recognised, even in the south-east of England, that a very considerable expenditure on crust reform is usually necessary, at least as an accompaniment, and preferably as an antecedent, to systematic surface tarring; while up to the present hardly any evidence that tarring reduces the cost of maintenance seems to be forthcoming—at any rate with respect to rural and semi-urban roads. As regards the traction engine, which is by far the worst enemy of tarred roads, any general comment is somewhat feeble in face of the unfortunate fact that the authorities responsible for the framing of regulations persistently ignore the enormous annual expense due to their failure to issue suitable regulations with regard to the wheels of traction engines.

* * * *

Standardisation.

The question of standardisation is of special interest to municipal engineers in view of the excellent work that has been accomplished by the committee of the Institution of Municipal and County Engineers appointed to deal with the subject. It was specially appropriate that Mr. Ernest J. Elford should have chosen standardisation as the subject for his paper before the recent annual meeting of the Institution, inasmuch as he has presided over the Institution's committee for the past two years, and has displayed great ability and energy in forwarding the proposals for the standardisation of those materials which are largely used by municipal engineers. It has been said in more than one quarter that a possible result

of standardisation will be to put a brake upon progress, but it must be remembered that standardisation itself may be progressive, the minimum standard of to-day being raised in course of time with the onward march of scientific progress.

This flexibility of standardisation is secured by the permanent establishment of the Engineering Standards Committee. The direct advantages of standardisation are so well known as not to need recapitulation. They may to some extent be gauged by the fact that since the adoption, at the instance of Sir Joseph Whitworth, of standard screw threads, and the establishment, at the suggestion of Sir John Wolfe Barry, of the Engineering Standards Committee, a sum of over £30,000 has been expended on the work. In regard to individual materials, an excellent example of the practical benefits which may accrue from standardisation is afforded by the case of tramway rails. Before the publication of the standard specification, there were more than seventy different sections of tramway rails in use in this country, whereas the committee have found that five sections are sufficient to meet practically all cases.

The greater part of Mr. Elford's paper was devoted to a discussion of the standard specification for vitrified ware pipes. A draft specification was prepared by the Standardisation Committee of the Institution of Municipal and County Engineers, and sent by them to the Engineering Standards Committee. A conference was thereupon summoned, at which it was unanimously decided that it was desirable that a standard specification should be prepared, and a sectional committee was accordingly appointed. Unfortunately, the suggestion of the municipal committee for a chemical test was vetoed by the expert chemists as impracticable, and an absorption test had perforce to be adopted. The specification also deals with strength, soundness, thickness, length, shape, permissible deviations, glazing and marking. Some difference of opinion exists as to the possibility of specifying a standard form of joint, but many experts appear to favour something like the Stanford joint, as giving initial concentricity. It may be safely said in any case that municipal engineers will welcome a standard specification for pipes and for other materials, such as road metal and artificial stone, which they largely use, as cordially as they received the specification for Portland cement, which has proved of such great value.

Mersey and Irwell Joint Committee Annual Report.

Among the annual reports issued by the many authorities in this country some are filed away without being read, and only a few are ever taken out for reference at some future period. Others are read with interest and kept at hand for frequent reference. Among the latter are the annual reports of the Mersey and Irwell Joint Committee, and the reason these are read is that Mr. Hugh Stowell, the chief inspector, has the faculty of making them interesting and, as a rule, he contrives to make some pertinent and useful observations. The present report, which we print on another page, is an example of this kind, and it would be a good thing if it could be read by the members of many local authorities. One of the observations has been made before, but it cannot be repeated too often. Mr. Stowell states from his own experience that a very important factor with regard to efficiency is that of management. "There are instances in the watershed where works, although not up to modern requirements, are nevertheless dealing satisfactorily with their sewage, owing to careful and good management. On the other hand, there are instances of sufficiently designed works proving inefficient owing to unsatisfactory or insufficient attention, but these are chiefly at the smaller works, where continuous supervision by a skilled manager cannot be afforded . . . . Sewage treatment on modern scientific lines must be recognised as an operation needing skilled management, which should be provided by the appointment of experienced and sufficiently-paid managers, an expenditure which will undoubtedly prove economical rather than otherwise." We would emphasise the accuracy and importance of this statement. The Association of Managers of Sewage Disposal Works is doing much to provide skilled managers, and it only remains for the owners of works, both public and private, to offer suitable remuneration in order to secure experienced men.

An interesting feature of the report is the statement that the percentage of efficient works, with the total number of works in operation, has risen from 66 to 77 per cent, and that this has been brought about in most cases without resort to legal proceedings. This is excellent testimony to the energy and, better still, to the tact and diplomacy of Mr. Stowell and his staff. Most of the works which are not efficient at present are either being improved or new works are being constructed to take their place. In several places storm-water tanks have now been in operation for some time, and this modern method of treating storm water has been found to effect a great improvement. The reference to the regulation of natural water-courses, in which direction much useful experience has been gained in the Emscher district of Germany, is timely and should be acted upon, and the advice as to the cleaning of mill dams should be followed. Indeed, the whole report is very interesting, and demonstrates once more the necessity for the establishment of rivers boards for all the watersheds in the country, as recommended by the Royal Commission, but not yet brought into being.

* * *

Factors Affecting Cost of Road Maintenance.

We especially draw the attention of our readers to the article appearing elsewhere in this issue, suggesting the importance of utilising costs accounts of road maintenance in such a way that the effects of various factors may be traced and their importance estimated. In every other branch of engineering work, or almost every other branch, it is recognised that detailed costs accounts are of great value in enabling work to be carried on with efficiency and economy. If it is not worth while to maintain the most rigid and detailed system of account-keeping throughout the whole range of the work, and at all times, we believe that, especially to road engineering, it is nevertheless worth while to make an elaborate analysis of costs here and there, and from time to time, in order that information may be gained as to the most important of the factors affecting the total cost of maintenance and repair. The great variety of conditions in highway engineering, and their sudden changes, make it desirable to carry out special investigations on certain lengths of road with greater thoroughness and in more detail than can be attained in the case of the system as a whole. It is suggested that much valuable information might be gained by comparing the costs of maintenance of short lengths of road, each of which exhibits one marked feature of divergence from the average, or from an otherwise similar length.

Our correspondence columns are open for the purpose of recording any facts, figures or opinions which our readers may be able to send us during the next few weeks; and the fact that surveyors have not at present at their disposal the funds and staffs needed for this purpose need not deter them from making practical suggestions as to the manner in which such accounts should be kept, assuming that the need for a regular organised system will be recognised in official quarters. A few definite comparisons of the kind suggested, dug out from data already recorded, would, we believe, suggest the consideration that the work of the local surveyors in recording the prime elements of cost is quite as important statistically as the marshalling of the facts with a view to the organisation of a system of keeping accounts and of distributing the burden of maintenance amongst the various persons concerned.

A very strong committee is engaged in the preparation of a report upon statistics for next year's Road Congress. It includes two county surveyors, Mr. James Moncur, M.INST.C.E., county surveyor of Staffordshire, Mr. R. J. Thomas, M.INST.C.E., county surveyor of Buckinghamshire and president of the Institution of Municipal and County Engineers; Mr. A. E. Nichols, M.INST.C.E., borough engineer of Folkestone; Mr. W. D. Harding, clerk to the Wood Green Urban District Council; Mr. E. J. Gowen, clerk to the Rural District Council of Croydon; and Mr. Reginald Ryves, ASSOC.M.INST.C.E., chairman.

* * *

Pollution of Streams.

Two valuable papers were contributed to the Industrial Hygiene Section of the recent Congress of the Royal Sanitary Institute at York by Dr. H. Maclean Wilson, chief inspector of the West Riding Rivers Board. The first, dealing with the pollution of streams by coal-washing water, is of interest only in colliery districts, but is none the less important. The most interesting and most hopeful result of the work which has been done so far in preventing this kind of pollution is that the measures of purification adopted by colliery proprietors have resulted in a great saving to them. "When the dirty water from the washers was discharged untreated to the streams a much larger quantity of water was needed for washing the coal, and it carried with it a large amount of good coal in suspension, amounting in some cases to 200 tons per week. This coal is now almost always recovered and mixed with the washed coal," or utilised in some other way. It is curious how, in a number of cases where it has become necessary to prevent a public nuisance from some industry, the means adopted to that end have also prevented waste of good material, and have thus been a source of profit to the owner. Naturally, when this has been demonstrated, there is little difficulty in securing regular and careful attention to the treatment in question.

Among other cases of this kind are pollution by wastes from paper mills, and nuisance from factory smoke, and the pollution of streams by spent gas liquor from gasworks. These latter are in such general use that the second paper by Dr. Maclean Wilson dealing with the methods now in use for prevention of such pollution and the recovery of ammonia is of general interest, and should be valuable to all who are confronted with the difficulty of dealing with the wastes from gasworks. Dr. Wilson's experience in matters of this kind, and the opportunities he has had of observing the results obtained by the various processes which have been tried from time to time, render his paper extremely interesting. Among the economies effected by the new processes we notice that less plant is required, and at the same time not only is the yield of sulphate of ammonia increased, but it is of better quality, and less acid is needed for the absorption of the ammonia. Further, the quantity of water required is very greatly reduced. Thus there are savings all round: lower initial outlay for plant, and less cost for operation and maintenance. The fact that the annual congresses of the Royal Sanitary Institute afford opportunities for the publication and discussion of papers of this character fully justify the interest taken in such meetings and their continuance in the future.

* * *

Consulting Engineers.

We have already set before our readers the aims and objects of the newly-formed Association of Consulting Engineers, and we now have to record the first meeting of the members held for the purpose of receiving the rules and the report, and proposals of the provisional committee, and electing the first committee of the association. The chief idea which underlies, and in our view justifies, the formation of the new body is to enable the public in employing consultants to identify engineers who are not directly or indirectly concerned or interested in commercial or manufacturing interests, such as would tend to influence the exercise of independent professional judgment. It is not in Great Britain alone that the necessity for the establishment of such an association has been felt, as similar bodies are already in existence both in Germany and the United States. It should be carefully observed that the formation of the new body is in no way intended to imply that *any* duly qualified engineer should not be consulted on any engineering matter in regard to which he is an expert; but it does mean that the public are entitled, in employing a consultant, to distinguish the independent consulting engineer from the expert who is closely identified with commercial or manufacturing interests. There has hitherto been no source from which reliable information of this kind could be obtained, and the new association thus fills a definite gap in the already-existing professional societies. There are at present eighty members, and a strong committee has been formed. A full report of the first meeting of the members will be found elsewhere in this issue.

* * *

Contractors' Retention Money.

Although the term "retention money" is one which has a definite technical meaning when used in connection with building and engineering contracts, it appears from a case decided in the High Court on the last day of the Trinity sittings that, according to the strict legal interpretation of a contract, the phrase may have a different meaning from that in which it is ordinarily used. In the case referred to the clause of the contract relating to payments was drawn in the usual form—*viz.*, a monthly payment of 80 per cent of the certified value of the work executed, and a payment of 15 per cent on completion, the remaining 5 per cent being paid six months after completion. There can be no question that in ordinary engineering language the 5 per cent was "retention money" and not the 20 per cent, and expert evidence to this effect was given. Nevertheless it was held that the contractor, in granting a charge on the retention money to a third party, had mortgaged the full 20 per cent. It must not be assumed, however, from this decision that the full 20 per cent would have been held to be "retention money" as between the two parties to the original contract. The *ratio decidendi* appears to have been that in granting the charge the contractor intended to include the larger sum as retention money, and was understood by the assignees as doing so. In other words, the decision was based on the special meaning attached to the phrase "retention money" by the contract of assignment, and not on the ordinary interpretation of that phrase as applied to the original contract for the execution of the works.

* * *

Mr. John Burns and Housing.

The President of the Local Government Board has this week been drawing upon the reserves of his inexhaustible optimism in the matter of land and housing in a speech which he delivered at Wimborne. Into the political aspect of his remarks it is not our intention to trespass. We would confine ourselves to the facts which he cited with respect to the housing question, and these are sufficiently striking to be worthy of repetition. As an illustration of how the Housing and Town Planning Act is operating, Mr. Burns stated that he had sanctioned more loans for rural housing in the last nineteen months than had been sanctioned by his department in the previous twenty years. This would tend to prove, if anything could, that the need for the Act was pressing, and that public opinion is ripening very rapidly upon the most important of all social and sanitary problems that we have to deal with. It is a happy omen that politicians are engaged in a healthy competition to accelerate the pace of housing reform. There is little fear, apparently, of our going too fast, and there is no denying that hitherto we have gone much too slow for the public weal.

Road Construction and Maintenance in Herefordshire.*

By G. H. JACK, F.G.S., M.S.A., M.R.SAN.I., County Surveyor.

The provisions of the Local Government Act of 1888 render it impossible for the county council to make any payment to a district council unless the county surveyor issues a certificate to the effect that the roads in each particular district have been "properly maintained and repaired." At the time of the passing of the Act what was considered the proper maintenance of main roads would now be considered improper maintenance, owing to the altered conditions brought about by motor traffic. Proper maintenance of roads subject to heavy engine and swift motor traffic would be difficult to define at the present time. The whole matter is still in the transition stage.

It has not yet been decided how best to deal with the roads supporting the ever-increasing mechanical traffic. It is practically certain that general rules applicable to the whole country cannot be laid down. The methods suitable in one county are not suitable in its neighbour. Each road must be considered separately, and due regard must be had to the subsoil, lie of the road, drainage, and so forth. It is absolutely impossible to deal with engine traffic on foundationless roads.

I find the task of preparing my annual report under the Act an increasing difficulty, if only for the reason that the fears I expressed in my first annual report have, in many instances, become realised—namely, that it is now a question of remaking rather than maintenance.

The district councils are under contract to "properly maintain" roads in condition to support engines and motors, when the crust is only 4 in. thick, and the subsoil soft red clay. In my opinion, such a contract is impossible of fulfilment, roads so conditioned cannot be properly maintained. It is distasteful to me to be obliged to penalise the contracting district councils when I know that the cause of my complaints is largely beyond their control. The Act nevertheless insists that they "must" undertake the maintenance if the county council requires them to do so.

It has always struck me as being rather unfair in cases where my certificate is withheld to deduct the whole estimated cost of roads, parts only of which may be in an improper state of maintenance. I should have thought it more reasonable to withhold payment in respect of lengths failing to comply with the standard of repair demanded. The county clerk, however, rules that the whole, and not a part, must be disallowed. . . .

Sec. 11, 5, refers to improvement, enlargement, or "other dealing" with the main roads. This rather vague clause embraces the necessary reconstruction of weak roads, which the county council may also require the districts to undertake—a very large order. . . .

TRAFFIC.

To successfully cope with the many new difficulties which the great increase in weight and speed of traffic involves is now an exacting and difficult business. At the time of the passing of the Act there was little, if any, "through" traffic. The coaches had long disappeared and the motors were not dreamt of. It was for many years easy to deal with the roads as divided up among the various districts. Nowadays the aspect is changed. A motor entering the county on the western border leaves it on the east in about the space of two hours, and during that time the car has traversed main roads controlled by no fewer than seven separate highway authorities. Herefordshire is now feeling the strain of the altered traffic conditions, which was felt much earlier in those counties where the change came more rapidly.

THE IDEAL ROAD.

Another year has passed and road surveyors are still in quest of the ideal road. I will not weary the council with any description of the many methods which have been put forward as ideal, but will content myself with saying that there does not exist any particular method suitable to all conditions, and further, that the best methods are all expensive and fall short of the ideal. A few years ago it was thought that a thin skin of tar on the surface had solved the whole problem. It is now difficult to understand that such a proposition should have had so large a following.

TAR PAINTING.

Tar painting is now relegated to the position of a temporary measure, successful in keeping down the dust for a single season, and, where applied to roads with good natural or artificial foundations, beneficial to some undetermined degree to the life of the road. It does not, however, take a place at all in the great problem of sound road construction, and it is a doubtful, if expensive, factor in maintenance. I have always persistently objected to painting surfaces with untreated gasworks tar even on good roads, and have considered it a waste of money on weak roads. In January, 1909, the council decided not to carry out any such work on our foundationless roads, and I may venture to say that the wisdom of this decision is now generally endorsed. Until very recently the full force of inventive genius has been directed to "surface treatment." It is becoming recognised that strong construction must be the first consideration, and indeed all surface treatment, however good, must fail on roads resting on subsoil which becomes soft during the winter months. Strong construction on roads subject to heavy engine traffic is such a palpably necessary consideration that one is rather surprised that it is still very often given second instead of first place in the anxiety to obtain what has the superficial appearance only of a good road, even if its life is short and out of all proportion to the cost.

EXPENDITURE.

In spite of the great increase in expenditure during the last ten years it is difficult to maintain the roads in good condition. This cannot be understood by many. The initial difficulty is to be found in the fact of the roads not being constructed to meet modern traffic demands. It is an expensive and at the same time ineffective proceeding to put on thin surface coats upon such roads. Given continued wet weather the passage of the first heavy engine is sufficient to destroy the contour of the road; when this is done the deterioration is rapid, owing to the retention of water upon the weakened surface. On such roads as that through St. Weonards, for instance, one of three things must happen: (1) Traction engines must be prohibited; (2) the road must be reconstructed; (3) users of engines must pay for the damage done. In my view the first suggestion is most in accord with common sense. The road is 6½ miles long, and to reconstruct it for engines would cost £10,000. The suggestion is absurd; the locality does not warrant any such outlay.

So far as this county in particular is concerned, my conclusions are as follows:—

(*a*) Reconstruction and drainage must be resorted to on all stretches of road which are liable to give way during the winter owing to subsoil weakness, especially those places where the underlying clay is softened by subsoil water.

(*b*) Waterproof coatings, such as Tarmac, tarred Clee Hill stone, or tar-grouted macadam, should be laid down on lengths which give way owing to the percolation of water through the surface.

(*c*) On the strong roads, and roads not subject to engine traffic, the existing system of water-bound metalling with Clee Hill binding material will suffice for a long time to come.

I am now carrying out experiments mostly under Road Board grants in order to ascertain the wearing qualities of stone quarried in the county and bound with asphalt, distilled tar, Tarvia, and glutrin. I am hopeful of obtaining a surface crust as good and at the same time cheaper than the Clee Hill stone for roads in the southern parts of Herefordshire.

HEAVY ENGINES.

There is very urgent need for an alteration in the law in respect of heavy engines on highways. The majority of our roads simply cannot support engine traffic, and its continuance in wet weather results in a ruinous expense.

I have some hope of converting the roads for fast motor service at reasonable cost, but I have no hope of successfully combating the engine difficulty short of reconstruction, the cost of which is out of all proper-

* Extracts from Annual Report.

tion to the value of the engines or the work they accomplish.

The least that should be done is to prevent the passage of engines during continued wet weather. Such traffic is inimical to the interests of the general body of persons called upon to pay for the roads and ought not to be allowed to continue. . . .

THE CONTRACT SYSTEM.

The council having recently confirmed the preference for the contract system of management, it remains for me to continue as hitherto to endeavour to work that policy in a manner least calculated to cause trouble and inconvenience. It is impossible to work the Act quite smoothly unless the roads are maintained in a fairly high state of efficiency. If they are not so maintained, the Act gives me no option but to withhold my certificate. There is no mention in the Act of extenuating circumstances, which, to my mind, should be taken into account. The roads must be presented at March 31st in a passable condition. A difficulty this year is to be found in the fact that in most of the districts the contract work was incomplete at March 31st, and if some allowance is not made for the exceptional weather and the coal strike, I should be bound to disallow many miles of roads. Such a course does not commend itself to me. I feel that regard must be had to all the circumstances. In all contracts, extension of time is granted in respect of inclement weather and in case of strikes, and I fail to see why these road contracts should be an exception. There are cases where I think the stone could have been applied earlier if every effort had been made.

THE FUTURE.

The present is necessarily a time of progress in road construction and maintenance, and progress, generally speaking, is inseparable from change of method, and in no sphere more than road maintenance does this apply with greater force. On our much-used roads, the old method of thinly coating the worst stretches each year will have to give way to the permanent strengthening of all the weak places before the metalling is applied, otherwise the council will lose during the winter months the value of the hard Clee Hill metalling, which is simply churned up with the soft clay subsoil. The water binding will have to give way to something more adhesive and waterproof. All the sharp bends on the roads must be specially treated in some way, in order to withstand the much heavier wear due to the fast traffic. It is clear to anyone using the roads that the surface on these sharp bends is for the most part loose during summer and holds the water during winter.

Of late I have given serious consideration to the necessity of using to the utmost the natural resources of the county as regards the work of strengthening and, for the less important roads, for surfacing also. I have prepared a map showing the position of all quarries in the county from which sound stone can be obtained, and am now preparing a geological section of each of these quarries and am locating thereon the particular beds which I consider suitable for our purposes, both as regards foundation and surface material. This will take some time to complete, but when it is completed it will supply valuable information.

Clee Hill stone, preferably graded and tarred at the works, will always be found hard to beat for surfacing the trunk roads. I am very hopeful that some of our best local limestones, tar-grouted and topped with Clee Hill chips, will be found to supply all the needs of the less important roads for some time to come, and, in addition to being cheaper than untarred Clee Hill stone in some parts of the county, will be the means of employing much local labour in quarrying, breaking and carting the material. For strengthening the sides and foundation work the limestone cannot be beaten, except in situations where slag comes cheaper.

ALTERATION OF "SURVEYOR" TELEGRAPHIC ADDRESS.

In order to expedite the delivery of telegrams and cablegrams sent to this journal, we have, at the suggestion of the Post Office authorities, added to our registered telegraphic address, "Municipium, London," the indicator word "Fleet," representing the office of delivery. Telegrams should therefore now be addressed to us as follows: "Municipium, Fleet, London." No charge is made for the additional word, the full address being reckoned as two words.

POLLUTION OF STREAMS BY SPENT GAS LIQUOR.*

By H. Maclean Wilson, M.D., B.Sc.,
Chief Inspector, West Riding Rivers Board.

In the manufacture of gas large quantities of gas liquor are produced. It was at first looked upon entirely as trade refuse, but its treatment for the recovery of the ammonia it contains was soon undertaken, and this ammonia now yields a very considerable profit. The works at which ammoniacal liquor is produced or dealt with are either ordinary gasworks or the premises of chemical manufacturers, patent coke ovens, blast furnaces, shale oil works, or in works where gas producers have been installed.

The purification of this kind of refuse has been a problem difficult to solve. It is easy, by the use of simple settling tanks, to get rid of suspended solids, but these, although objectionable, are innocuous compared with the matters in solution. It has been shown by Gilbert J. Fowler, D.Sc., F.I.C.,† that the liquid when diluted is amenable to treatment on biological filters. He has constructed a percolating filter of somewhat coarse material, 9 ft. deep, and prepared it either by using material which had previously formed part of a sewage filter, or by ripening the filter by the application of a weak sewage until nitrification was induced. To such a filter he has applied the spent liquor from gasworks, clarified by settlement and diluted to ten times its original volume, either with clean water or with the filter effluent, at the rate of 100 gallons of the dilute liquid per square yard per day. This treatment effects a very marked reduction in the oxygen-absorbed figure, while the sulphocyanides and phenols are also greatly reduced. Mr. Radcliffe, of Barnet, has introduced two methods, one of which is in operation at Sutton and another at Enfield, for the partial purification of spent gas liquor, so that it can be received into the public sewers without upsetting the treatment of the sewage. He claims that by his latest method he can remove all solids in suspension, all free lime, all hydrocyanic acid, 70 per cent of the sulphocyanides, 60 per cent of the solids in solution, and can reduce the oxygen-absorbed figure by 75 per cent. Fortunately, although methods of purifying this kind of refuse are few and somewhat expensive, there are various ways, especially at collieries, in which it may be disposed of so that it does not reach a stream. Direct evaporation of the chemical refuse in furnaces of special construction has been adopted in several instances, but the latest developments in coke oven chemical works seem likely to render superfluous all the foregoing methods of dealing with the gas liquor. At the least, they will reduce the volume and alter the character of the refuse to be dealt with, making the problem much easier.

The economies effected by the new processes are many. The chemical plant is simplified by leaving out the water scrubbers and the coolers and ammonia stills; the yield of sulphate is said to have increased by 5 to 10 per cent, and this is easily explained by the simplification of the plant and the consequent fewer opportunities for loss of ammonia. In the old process there is some loss by leakage, but more especially because the ammonia in the gas is not completely absorbed by the water in the scrubbers, and because that in the gas liquor is not completely yielded up in the process of distillation. The quality of the sulphate is also improved, and less acid is required for the absorption of the ammonia, inasmuch as the fixed ammonia salts distilled from the coal do not require to be decomposed with lime and again fixed with acid. Further, the quantity of water required is very greatly reduced, the steam and lime necessary for the ammonia stills in the old system are not required, and there is a considerable saving in the initial cost of the work as well as in the upkeep.

The Institution of Water Engineers. — We are informed by the secretary, Mr. Percy Griffith, M.Inst.C.E., that the offices of this body have been removed to 20 Victoria-street, Westminster, S.W. The telephone number of the institution will continue to be Victoria 5913, and the telegraphic address is "Colenga, London."

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

Following the proceedings reported in last week's issue in connection with the recent annual meeting of the Institution of Municipal and County Engineers, the following paper was submitted for discussion:—

STANDARDISATION.

By Ernest J. Elford, M.Inst.C.E., M.I.Mech.E.,
Borough Engineer, Southend-on-Sea.

Before referring more particularly to the subjects in regard to the standardisation in which this institution has taken an active part, the author would like to refer briefly to the subject of engineering standards generally. The principle of standardisation has long been acknowledged and practised, probably the earliest example being standard measure of time, and as early as the reign of Henry III. efforts were made to enforce the use of standard weights and measures. In other respects, however, the principle of standardisation made little progress until comparatively recent times. In regard to engineering matters, the efforts of Sir Joseph Whitworth appear to have been the first of a serious character. By securing the adoption of standard screw threads and gauges, and by his efforts to secure greater accuracy and uniformity, he did much to facilitate the progress of engineering in this country, and indeed to lay the foundations of the vast engineering industry now possessed by this country.

Valuable and important, however, as were the results of his work, it was found that progress was being seriously impeded by difficulties and confusion arising from great divergence in the manufacture, dimensions, and use of various materials required for engineering work. This was particularly felt in connection with the rolling of iron and steel sections of various kinds, the use of which in every branch of engineering was increasing by leaps and bounds. Every engineer appeared to think it incumbent upon him to design his own particular sections, with the result that an enormous amount of unnecessary expense was involved and serious delays occasioned.

Before the days of rolling mills, when all this class of work was forged, variations in design were comparatively unimportant, but with the introduction of mechanical means involving heavy initial cost, and depending for economy upon the production of large quantities of material to one pattern, the practice referred to could no longer be justified. Many of the sets of rolls cost £200 and upwards, and most of the manufacturers held hundreds of rolls which could not be used for more than one order. Special rolls had often to be cut for supplying orders for 100 and 200 tons and then scrapped. The effect, therefore, was to enormously increase the cost of production and to cause a great waste of time.

To Sir John Wolfe Barry belongs the credit of initiating a movement of reform. In 1901 he brought the matter before the Council of the Institution of Civil Engineers, and, being convinced of the importance of the subject, the council took steps to form a special committee to deal with the question. This committee includes representatives of the Institutions of Civil Engineers, Mechanical Engineers, Naval Architects, Electrical Engineers, and of the Iron and Steel Institute. The scope of the work has become very much enlarged, and there are now about forty sectional and sub committees with over three hundred members, comprising representatives of Government departments, engineers, manufacturers, and other interested parties working under the main committee upon various branches of the undertaking. Upwards of £30,000 has already been expended on the work of the committee.

The field covered includes the standardisation of tested sections, the preparation of standard specifications for other materials, the formation of standard tests, and in one case the preparation of standard specifications for complete machines. Many of the matters dealt with are of considerable interest to the members of this institution, notably Portland cement, tramway rails, rolled sections, cast-iron pipes, and vitrified sewer and drain pipes. Standard specifications relating to some of these subjects have now been issued several years, and there is overwhelming evidence as to their value. The specification for Portland cement is now very generally adopted, and has had the effect of causing a general improvement in the quality of material placed upon the market.

Sir John Wolfe Barry has quoted* the statement of a leading cement manufacturer as indicating the advantages following the publication of the standard specifications for this material, and in the author's opinion it will well bear repetition. He said—

"The result of the introduction of the standard specification has, no doubt, been to save a great deal of inconvenience to the individual cement manufacturer in reducing to a minimum the variety of odd specifications, some of them of the most peculiar and difficult character, with which he formerly had to deal, and from that point of view it is much more plain sailing for him in the production of the article which he supplies.

"Speaking for ourselves, we have welcomed the introduction of the British standard specification which is now being so largely adopted by the engineer and the consumer of cement, as, in these hard times of competition, it has equalised up the conditions under which the various manufacturers of cement have had to quote, and in specifying cement to the British standard specification, the consumer, in dealing with the tenders that he may receive for the supplies of same, knows that all the people tendering are doing so on even terms."

About 70 per cent of the tramway rails used in this country,† and the great majority of beams, angles, tie-bars, and channels, are now rolled to British standard sections.

The author has obtained from the manager of one of the largest rolling mills in the country the following statement of the advantages of standardisation:—

STANDARD SECTIONS.

(*a*) A very great reduction in the number of sections inquired for by buyers.

(*b*) As a result of the fewer number of sections, the amount of capital locked up in rolls (some of which are only used at very infrequent intervals) is materially reduced, depreciation and other charges being reduced accordingly.

(*c*) The smaller number of sections means less frequent roll-changing, with its attendant expense.

(*d*) Owing to the constant demand for standard sections, it is often possible to oblige customers for comparatively small quantities, as standard sections rolled and stocked usually find an early market.

SPECIFICATIONS.

There is a great saving in working standard specifications, as these facilitate chemical control, mixtures, and similar details.

The president of the Iron and Steel Institute, in his presidential address, delivered in May last, referred to this subject in the following terms:—

"The effect has been to reduce enormously the number of sections called for, as, owing to the very representative and influential character of the committees, British standard sections and specifications have been very extensively adopted, notably by the Admiralty, the Board of Trade, and Lloyd's Register. The British Corporation for the Survey and Registry of Shipping and the Bureau Veritas have likewise given effect to the committee's recommendations in their rules, with the result that the cost of roll stocks is being greatly reduced, and the manufacturer may now be content to roll into stock when it suits his convenience to do so, with the certainty that he will not have the material left on his hands, as was formerly frequently the case when almost every buyer had his own particular section and specification, which no other buyer could be prevailed upon to take, the advantage to the consumer of the adoption of the standard sections being quicker delivery (small lots frequently from stock) and reduced cost, practically no special rolls being now required."

The significance of these opinions is enhanced when it is known that, before the publication of the standard specification, there were more than seventy

* Lecture on Standardisation and its Relation to the Trade of the Country, delivered before the Institution of Engineers and Shipbuilders of Scotland.

† Seventh Report of Engineering Standards Committee.

different sections of tramway rails in use in this country, whereas the committee have found that five sections are sufficient to meet practically all cases. The fear has been expressed that standardisation would have the effect of so discouraging individuality of design as to seriously impede progress. As, however, except in rare cases where such a course is proved to be specially advantageous, the committee deals only with materials which are used in construction, the individual mind is allowed full scope in the use and assembling of the materials to form completed structures.

In addition, a safeguard is provided by the permanent constitution of the committee, which it is intended shall, from time to time, revise the specication in the light of later experience and development.

Having dealt so far with the general question of standardisation, the author will refer to that aspect of the subject which is of more particular interest to the members of this institution.

It will be remembered that at the annual meeting held at Plymouth two years ago Mr. Paton, in his presidential address, referred at some length to the adulteration and inferior quality of various materials in general use by municipal engineers, and suggested that the council should take up the question of standard specifications.

During the previous year a committee of the institution had been engaged in preparing, at the instigation of the British Engineering Standards Committee, a draft specification for sewer and drain pipes, and when at the first meeting of the new council the reconstitution of the committee was under consideration, the author suggested that the scope of the committee should be extended to enable it to deal generally with the subject of standardisation. This suggestion was adopted, and the committee has, during the past two years, devoted a large amount of time to the consideration of this subject.

The draft specification relating to sewer and drain pipes was completed and sent to the Engineering Standards Committee, who summoned a conference of representatives of various Government departments, engineers, manufacturers and others interested in the subject. This institution was invited to send three representatives, and on their motion the conference unanimously decided that it was desirable that a standard specification for vitrified ware sewer and drain pipes be prepared. A sectional committee was therefore appointed for this purpose.

The main committee selected as chairman of the sectional committee Sir Maurice FitzMaurice, chief engineer to the London County Council, and a number of meetings have been held under his able and sympathetic presidency.

In the course of their investigations the committee of this institution (which the author will refer to as the Municipal Committee) had accumulated a very large amount of evidence as to the inferior and unreliable quality of many of the pipes manufactured in various parts of the country, and they had been urged to do something to drive out of the market materials of this description. For this reason, in addition to various suggested tests for the finished article, they put forward the suggestion that if found practicable some chemical standard for the materials of which the pipes were to be made should be included in the standard specification. The committee felt that the practicability or otherwise of this suggestion was a matter upon which the opinion of the chemist and manufacturers should be obtained, and the suggestion was put forward with this view.

It is undeniable that a large number of pipes are supplied which to the eye appear to be quite satisfactory, but which in time deteriorate to such an extent as to give rise to serious trouble. Not long ago the author had to relay a 27-in. pipe sewer, about 500 ft. in length, which had collapsed, every pipe of which was found to be fractured. The pipes bore the name of a well-known maker, and had been laid about sixteen years. Probably at that time they appeared to be quite satisfactory, but when removed the material was found to have become most defective.

It was thought by the Municipal Committee that it might be found that the elimination of certain constituents from, and the inclusion of others in, the material of which the pipes were manufactured is essential for the production of thoroughly vitrified pipes; but unfortunately the chemists are of opinion that a chemical standard of this kind is not practicable. A few years ago the best pipes, in fact it might almost be said the only pipes of high quality, were those manufactured from the Devon and Dorset clays; but since then many of the Midland and other makers have, as the result of experimental work, and the exercise of great care in the selection and blending of clays and improvements in manufacture, been able to produce pipes of the highest quality.

The terms stoneware, fireclay, and earthenware as applied to sewer and drain pipes were always more or less ambiguous; but pipes made from Devon and Dorset or similar clays were generally included under the term stoneware, while pipes of Midland and other clays were usually designated fireclay or earthenware. Since, however, the latter were so much improved in quality these descriptions have practically lost all value. The aim of the Municipal Committee was to prepare a specification in such terms that all first-class pipes might be admitted and all inferior pipes rejected, and to ensure that all standard pipes should be made of dense, highly vitrified material. The old names have therefore been discarded, and standard pipes are to be designated vitrified ware sewer and drain pipes.

The suggested chemical standard for the material having proved impracticable, the committee had to fall back upon an absorption test, and it is hoped that this may be found both convenient and effective. One fact which has been brought to light while experimenting in regard to absorption, and which to most engineers will no doubt appear somewhat surprising, is that the salt glazing has very little, if any, effect upon the absorption, particularly in the case of better class pipes. It was thought at first that the glazing would interfere with the proper application of an absorption test; but it has been found that, for practical purposes, the effect of the glazing can be ignored in ascertaining the absorption figure. When applying a test of this kind it is, of course, essential that the samples should first be dried to constant weight, and with pieces of the size proposed this can be done under a temperature of 150 deg. C. in less than an hour. By subsequently boiling the samples as proposed, the maximum absorption is reached in forty minutes, so that the testing can be completed in a very short time.

The manufacturers on the Sectional Committee were not unanimous on the question of an absorption test, but a majority was in favour of the inclusion of a test of this kind.

The specification prohibits "slip" glazing, as this is generally applied to pipes of an inferior quality.

The interval water pressure test is to be adopted as a test for strength and soundness of the finished pipe, and the scale of pressures has been so calculated that the material will be required to sustain without damage a tensile stress of from 100 lb. to 125 lb. per square inch of sectional area. The general opinion is that for important work it is desirable to apply this test to each individual pipe, but having regard to the cost of so doing, the specification will contain alternative conditions which will enable engineers to call for pipes which have passed individually the hydraulic test and been stamped with the word "tested," or for pipes which have been made to the standard specification and are supplied as being capable of withstanding this test. The engineer will himself be entitled to select and test samples from each consignment of the latter class, but the makers will be under no obligation to apply the water-pressure test.

The specification also deals with such matters as thickness, length, shape, permissible deviations, glazing, and the marking of all pipes sold as complying with the standard specification, and the marking before sale of all inferior or defective pipes, and with the question of joints. The draft specification put forward by the Municipal Committee contained stipulations as to the dimensions and shape of sockets, but it was felt that in standardising a joint an effort should be made to improve the old form of socket and spigot, which, at any rate in the hands of the ordinary builder and estate contractor, is open to serious objection. Every engineer will agree that under proper supervision and by the exercise of care and skill in jointing, thoroughly good results can be obtained with this joint, but unfortunately hundreds of miles of house drains and considerable lengths of estate sewers are laid without care, skill, or effective supervision, and, notwithstanding this, the local authority is saddled with the whole responsibility for the subsequent maintenance and efficiency of the latter.

Fig. 1 is from a photograph of the section of a joint

typical of many which the author has from time to time removed, and the defects in which are directly attributable to the large annular clearance in ordinary spigot and socket joints. That this form of joint is by no means perfect is evidenced by the large number of patent joints placed upon the market during the past fifteen or twenty years, some of which have been very largely used. Unfortunately, however, these improved joints are seldom if ever used by the ordinary builder and estate contractor, but are adopted generally by those who could best ensure good work with the old joint. What is wanted is a pipe with a simple, inexpensive form of joint which, even when laid by comparatively unskilled and careless workmen, will give reasonably satisfactory results.

Fig. 1.

A modified form of socket was suggested by the municipal committee and was approved by a large majority of the members of the institution, who expressed their opinion in response to an invitation to do so, but on being placed before the makers it was stated by them to present difficulties in manufacture, and it had therefore to be abandoned for the time being.

For obvious reasons it is impracticable to adopt as a standard joint one which is covered by existing patent rights, and it is probable that the sectional committee will recommend a simple form of Stanford joint, the manufacture of which is now quite unrestricted. The cost of these pipes must necessarily be somewhat higher than that of ordinary socket and spigot pipes, but the labour of laying and cost of jointing material will be less, and it is hoped that in course of time local authorities may be able to obtain power to enforce the use for house drains, &c., of pipes which will give a concentric joint and true invert and that the standard Stanford joint may take the place of the old form of joint for all ordinary work. It cannot be disputed that municipal engineers are the largest users of vitrified ware pipes, and the author would express the hope that the members of this institution will do all in their power to support the efforts of their own committee to improve the quality of these important materials.

In addition to the work of the sectional committee on sewer and drain pipes, this institution has representatives on the sectional committees of tramway rails and cast-iron pipes for water, gas, and sewage, and representatives have also recently been appointed to attend a conference to consider the standardisation of road macadam. In addition, representatives of the institution's standardisation committee have taken an active part in the preparation of a standard specification for street lighting, by a committee called together by the Institution of Electrical Engineers, and composed also of members of the Institution of Gas Engineers, and of the Institution of Illuminating Engineers.

The draft specification which contains provisions standardising the unit and method of measurement, classification of streets, tests, and testings, &c., has now been completed and will be considered by the councils of the respective institutions represented on the committee. Probably, however, the most important work upon which the standardisation committee of this institution has been engaged—apart from the specification for vitrified ware pipes—is the specification for artificial stone paving. This was first issued about a year ago, and has had a good circulation; in fact, the first edition is now almost exhausted. It deals with materials, moulds, moulding, sizes, samples, tests and testing, maturity, marking, &c. The specification was prepared in consultation with, and received the approval of, the leading makers, and has already been found of considerable value. The author is aware that the work of the committee has been somewhat freely criticised, apparently in the belief that the matters dealt with have absorbed time and attention of the council which might have been expended with greater advantage to the members of the institution upon such subjects as security of tenure and superannuation. He is able to assure members that this impression is quite incorrect. The members of the standardisation committee who have been most devoted to the work of that committee have been not less devoted to the other work of the institution, and they submit that the work accomplished by them will prove the value to the members generally and increase the influence of the institution. Security of tenure and superannuation are undoubtedly matters of vital importance, but they can only be attained by special legislation, and in view of the present congested state of Parliamentary business and to the fact that practically the whole time of the Legislature is allocated to Government measures, it is almost hopeless to expect facilities for the introduction and passing of such a measure, even if the Government could be induced to preserve an attitude of benevolent neutrality, which is by no means assured.

In the meantime the author suggests that anything that can be done for the advancement of municipal engineering and in extending the influence of the institution must be of advantage to the members, and may in some measure hasten the accomplishment of the other objects to which reference has been made. In conclusion, he would urge the members of the institution to support and assist the standardisation committee in their efforts on behalf of the institution, both by adopting as far as possible the standard specifications, and by forwarding from time to time suggestions and information likely to be of value to them.

DISCUSSION OF MR. ELFORD'S PAPER.

Mr. J. S. Brodie (Blackpool), who proposed a vote of thanks, said he knew something of the work which Mr. Elford had put into this question. He had presided for two years over the committee of the institution which had had it in hand. He had been a member of that committee himself, and he spoke feelingly when he said they had been made to work. Information bearing on the subject had been obtained in various localities, and a specification for concrete had been out for some months. He took up the matter in his own district, with the result that the makers were working to the specification, and if the committee had done nothing more than that they would have done very good work. Many other materials appertaining to the work of municipalities they had had under consideration—from vitrified drain pipes to shovels and hammers. He hoped the committee would some day standardise all the things that they had occasion to use. It was urged sometimes that standardisation would not be altogether a blessing, that it would lead to lack of enterprise, lack of originality, and all sorts of evils. That was not so. Their standards were not like the laws of the Medes and Persians; if they fixed on a standard form for anything, and anyone came along with an improved form of it they would be quite willing to adopt it and cast their form aside.

Mr. E. J. Silcock (Westminster and Leeds), who seconded the vote of thanks, agreed with the suggestion that the members of the committee should from time to time give them some record of the work they had done. He wished to bear testimony to the advantages of standardisation with regard to Portland cement. They had undoubtedly made great advances in the quality of the cement which was supplied now compared with what they used to have some years ago. With so many specifications it was not worth the manufacturers' while to alter the make unless he had a very large order, and the consequence was that sometimes they got cement which was not so good as it should be since the standard specification had come into force; however, he had never had a consignment that had not passed all tests. He thought that said a great deal for the success of the manufacturers in complying with their requirements. The committee had not yet issued the standard specification for stoneware pipes, but that, he hoped, would soon be in force. The suggestion with regard to the modified form of socket was one which it did not seem to be possible to carry out successfully. It appeared to him that all the committee could do in the matter of the socket was to get some form of standard width and depth of joint. Materials should be of uniform quality and of a certain standard, but it seemed to him that a particular method of jointing should not be standardised, because that would interfere with the enterprise of private individuals in trying to improve the joints on the market. The Stanford joint mentioned by the author was a useful thing as a self-centring device for making a watertight joint; but personally, he

did not think it was of great value. A standard joint with a deep socket, allowing sufficient space for a cement joint to be made was more likely to be satisfactory, but in cases where water pressure was exceptionally severe no doubt some other form would be more applicable.

Mr. A. J. Price (Lytham) thought they were all agreed that they wanted standardisation for rails and cement, and the cement specification issued by the committee had been of great assistance. With regard to pipes, he thought it was rather a pity that the regulation adopted years ago of putting a black band round the inferior pipes had dropped out. There was no danger then of those with a black band being mistaken for something else. No doubt it was difficult to get a chemical standard. The stoneware pipe made in the Midlands could hardly be improved, because he knew in his own district in Lancashire they were getting pipes of the same manufacture, which were improved beyond conception compared with the pipes they got some years ago. With regard to the Stanford joint, he was in a district where they were practically waterlogged for a great part of the year, and he had always used a Stanford joint in preference to others on the market. He tested his pipes with water, and he did not like the test put down on the paper. He did not see the use of it.

Mr. Elford: That is a stress on the sectional area of the pipe.

Mr. Price remarked that if they were testing pipes they would not put this great stress on. He thought the Stanford joint practically met all requirements.

Mr. G. W. Lacey (Oswestry) said it was difficult in the case of certain articles to fix any standard. Take the case of steel rails. These naturally were wanted in certain sizes, and it was easy to standardise a certain number of sections, but then there was the composition of the steel to be considered. A pipe which was made in one part of the country differed altogether from one which was made in another, and it was not impossible to have many types of pipes on the market, all very good, to be used for different classes of work. The Stanford joint was a good one for obtaining true alignment, but it was not to be trusted altogether for watertightness. There were other cases in which standardisation had been very useful—cement, for instance, in which great improvements in methods of manufacture were noticeable. The more one could standardise as to quality the better; as to constructional methods, it seems rather more difficult of attainment.

Mr. J. S. Pickering (Cheltenham) said it was suggested that the chemical test was impracticable, and that the absorption test was to take its place. He would suggest that there ought to be a test for crushing. A hydraulic test, giving the tensile strain would go a long way to prove the quality of the material, but the most practical test was the crushing strain.

The President (Mr. R. J. Thomas) said it was very desirable that road materials should be standardised. There was now a most extraordinary state of things in the engineering world with regard to roads. The word "granite" had become a term covering every kind of hard material—basalt, quartzite, millstone grit—even limestones were advertised and sold as granite. It was very desirable, therefore, that the petrological description of the stone required should be specified. When the German engineers were over this year it was necessary to explain to them that granite was a term which covered a lot of materials nothing like granite. They were astounded by that revelation. Another standardisation they required was that of gauge. He bought material from a dozen quarries, and there were no two of them which supplied material of the same size. They all had their own gauges, and he therefore suggested it was desirable to standardise road material petrologically, and also with regard to gauge. He was on the committee which had to meet the Engineering Standards Committee to discuss the standardising of materials, and a sub-committee had been formed to discuss the question.

The vote of thanks having been passed,

Mr. Elford, in reply, said the making of a standard class of pipes had been considered by the committee, and a clause dealing with it would be included in the specification. He had its importance brought home to him some time ago when he was using some glazed bricks specified to be of best quality. A sample was submitted, and they were delivered at the works. When they came they all had "2" on them. The manufacturer had quite recently decided to mark all seconds bricks with a large "2." He need not say that the contractor was much surprised. The hydraulic test was for soundness. Mr. Pickering's point as to the inclusion of the crushing test had been very fully discussed by the committee, and they came to the conclusion that it was an unnecessary, troublesome and expensive test. It was tensile strength that a pipe was apt to lack, and by applying the hydraulic test they were putting on the pipe a full tensile stress. If they applied a crushing test they were putting the stress on the outside section of the pipe. They came to the conclusion that the hydraulic test was more useful and more easily applied. In regard to joints, he would like to say that the committee did not intend to lay down a standard method of jointing. The committee had had brought home to them from many sources the importance of having a joint that would give a large degree of initial concentricity. The object of the committee in suggesting a modified form of joint was not to ensure watertightness, that was a question of good workmanship. The committee thought it of great importance that there should be a form of joint which, without great trouble or the exercise of any great intelligence on the part of the man engaged in laying the pipes, would give a concentric joint. Personally he felt that the committee ought not to standardise the present form of socket. He did not suggest that the Stanford joint was suitable under all conditions, but it was a joint which gave initial concentricity. If something of the kind suggested was done, they might be able to get by-laws so amended as to be able to call for reasonable concentric joints in house drains. After all, these were the things they wanted to look to, and he hoped that in time good joints might be made universal. It was suggested that standardisation tended to stereotyping. Well, to his mind, standardisation should be progressive. If they had a standard which represented the minimum required for good work to-day, it might be necessary to raise that minimum to-morrow. It had been done in the case of Portland cement. In regard to the absorption test, he had carried out a good many tests, and had come to the conclusion that it was a very desirable one. He had had sent by the same maker two different lots of pipes. One gave an absorption test of between 8 and 9 per cent, the other an average of 0·38 per cent, an enormous difference. He thought that test would be one of the best included in the standard specification.

(To be continued.)

Exmouth's New Waterworks. The Exmouth Urban District Council's new waterworks at Dolton were formally opened on Tuesday last. The works carried out consist of a borehole, varying in diameter from 25 in. to 7 in., 338 ft. deep, pumping station, pipe line (rising main) 4¼ miles long to Squabmoor, and a reservoir 4 miles north-east of Exmouth. The pumping plant consists of suction gas engines in two units, each of 62 b.h.p. on anthracite coal; three-throw ram pumps in two units to lift from suction tank to Squabmoor. The air lift plant is in duplicate. The cost of the work is estimated at £15,000. The new pumping plant has been installed by Messrs. A. C. Potter & Co., London, to the specification of Messrs. G. H. Hill & Sons, Westminster and Manchester. In the initial stages of the scheme the surveyor, Mr. S. Hutton, rendered valuable service.

Pooh-Bah in Chilliwack.—The Judicial Committee of the Privy Council last week reserved judgment in the claim by the widow of Daniel McKenzie, on behalf of herself and two children, for compensation for the death of her husband. The Corporation of Chilliwack employed one municipal constable, named Calbeck, whose duties were those of police officer, sanitary inspector, lamp-lighter, path-master and pound-keeper. As the police-force he arrested McKenzie and another, and having locked them up in a wooden cell forming part of the court-house, left them there while he lit the street lamps and patrolled the streets. Unfortunately the wooden gaol caught fire, and by the time Calbeck, who carried the gaol keys, could be found it was too late to save either of the prisoners. The jury awarded the widow £600 and the children each £400, a verdict the Court of Appeal set aside. It is this decision upon which the Judicial Committee will give their judgment. Meanwhile, whatever the verdict be, we trust the Chilliwackians will draw the moral that the *operative* appointment of one officer for many and diverse offices is, though apparently a cheap device, a dear and dangerous one in the long run.

D*

Royal Sanitary Institute Congress at York.

THE CONFERENCE OF ENGINEERS AND SURVEYORS.

At the conference of engineers and surveyors, at which Mr. A. D. Greatorex, M.INST.C.E., borough engineer and surveyor of West Bromwich, and past-president of the Institution of Municipal and County Engineers, occupied the chair, the following papers —reproduced in our issue of last week — were submitted for discussion: "Sewage Disposal in Rural Districts," by Ascough Rodwell, engineer and surveyor, Skipton Rural District Council; "Sewage Treatment — Advantages of Land over Artificial Schemes," by John Manley; "One Solution of the Sludge Problem," by Arthur Hindle, M.INST.C.E., and P. Holt Whitaker, ASSOC.M.INST.C.E.; and "Notes on the Extension Seawards of the Gynn Outfall Sewer at Blackpool," by John S. Brodie, M.INST.C.E., borough engineer and surveyor.

SEWAGE DISPOSAL IN RURAL DISTRICTS.

In the absence of the author only one speaker offered any remarks on the paper on this subject submitted by Mr. Ascough Rodwell, engineer and surveyor to the Skipton Rural District Council.

Mr. F. E. Critchley (Gloucester) stated that in his district they were developing a kind of plateau or tableland on which a number of villas were being erected, there being no sewers within a long distance. They had tried several modes of treating the drainage from the houses, and had encountered many difficulties, the chief of which was with regard to the effluent. They were using as far as possible septic tanks with filter-beds. They had no stream, and the depth of soil was only from 10 to 12 in., after which they came to rock. The medical officer of health did not like the idea of discharging the effluent over such ground, because it was not known what buildings were going to be put up later, and his (the speaker's) desire was to get an expression of opinion from other engineers with regard to the matter.

SEWAGE TREATMENT: ADVANTAGES OF LAND OVER ARTIFICIAL SCHEMES.

Considerable discussion ensued upon the paper by Mr. John Manley, in which the advantages of land over artificial schemes of sewage treatment were discussed.

Colonel A. S. Jones, V.C., who was the first speaker, mentioned that the Army Council, having discovered that he had passed his eightieth year, had decided that he should retire at the end of seventeen years' work on the Aldershot Camp farm. They had not yet appointed a successor. Land treatment had been his theme for forty years, and he believed the value of natural purification was acknowledged everywhere. By forcing microbes to do more than they ought, filter-beds only became clogged, and the cleaning process which afterwards became necessary was a most expensive one. Moreover, they were not told what became of the dirty water from them. He thought it was becoming more and more understood that land must be properly attended to, and that there must be really honest attention by those responsible for its management. From the first it had been his aim to get the help of the best agricultural labourers he could find and interest them in their work, and any success he had attained on the Camp farm was due to the assistance he had obtained from men of that type.

Prof. Tyndale (Scientific Adviser to the War Office) said he had intimate knowledge of the Camp farm at Aldershot. The ground at first was let by the Government to a farmer, who naturally turned his attention to profit making rather than the purification of sewage—with the usual results. In a report which he made he was able to show that the system was wrong, and he was instrumental in getting Colonel Jones appointed to manage the farm. With the advent of Colonel Jones the aspect of the place completely changed. The farm was reorganised, under-drained, and put in a really fine condition, and he fully endorsed all that Mr. Manley had said in his paper with regard to it. The question arose whether it would be more economical to adopt artificial sewage treatment at Aldershot. He worked out a system of suitable artificial treatment, but found that no such process would give better results than or [illegible] any [illegible] over the farm. When the artificial treatment of sewage first came before the public, the latter, as in all cases of the sort, seemed to rush headlong into the matter, and everything had to be biological treatment just as everything nowadays must be ferro-concrete. (Laughter.) A vast number of artificial schemes were adopted, good, bad, and indifferent. He was naturally of an open mind. He supposed there was no system of artificial treatment with which he was not intimately acquainted, and there was no doubt there were thousands of cases where artificial treatment must be adopted, and gave all the results desired. At the same time he was glad to say that the old system had survived, and there were numbers of instances where sewage farming would always prove to be the correct method of dealing with sewage. At Aldershot all the conditions were favourable to the system, and it was essentially a case where sewage farming should be adopted. The other camp farms were working on the same system, and the loss varied between £1,500 and £2,000 a year. That on the face of it might seem a great deal, but if they looked at it in another way it was a cheap payment for getting rid of the sewage of 30,000 people, amounting to about 1,000,000 gallons daily.

Mr. G. W. Lacey (Oswestry) said he agreed that no one, even the strongest advocate of the system, would be inclined to insist that artificial treatment should be adopted in all cases, for there was no doubt that absolutely natural methods were in every case the best. It did not matter whether it was applied to sewage disposal or anything else; Nature's methods would always be the best. But there was such a thing as science, and science was progressive, and they owed much to it. If it were not for science, civilisation would not have reached its present high stage, and he thought it was rather out of place that the author of the paper should have referred in terms one did not like to read of those schemes which were really the originators of the biological treatment. These really deserved something more than a sneer, his view being that they were the pioneers of a very valuable system. It might also be considered that the Local Government Board would not have appointed a commission if there had not been ample ground for it—and they said it was generally more economical and satisfactory to employ artificial methods. Prof. Tyndale's contribution to the discussion was admirable. Given suitable land, by all means treat your sewage wholly and solely on the land. It might require preliminary treatment, and in his own case they had the dual system. They had desired in a recent scheme to adopt artificial treatment alone, but, having purchased land, the Local Government Board insisted on their making use of it, and they had therefore adopted a system of partial treatment on percolating filters and final treatment on land. The difference between the two effluents was very marked. The finishing treatment was a very valuable one indeed. With regard to the Aldershot farms, Colonel Jones regarded the idea of artificial treatment as the cultivation in a more condensed area of the same bacteria which fulfilled their work on land. Colonel Jones was an advocate of land treatment almost *per se*, and it was interesting to hear him pay a tribute to the value of artificial filters, inasmuch as their object was to some extent to reproduce the methods of Nature.

Councillor A. Upson (Maidenhead) said Mr. Manley's paper would not lead anyone to abandon artificial treatment for land. In the case of Redruth, which had been mentioned, he did not think sufficient data had been given to induce any engineer to reconsider his position, and in the information with regard to Wokingham the case was given away because contact beds had been constructed for a portion of the sewage. That being so, where was the argument for land treatment? He had been astonished at the expense of the land treatment carried on at Aldershot, and there were many engineers throughout the country who would be glad to do it at one-third of the cost mentioned.

Mr. J. D. Watson (chief engineer to the Birmingham, Tame and Rea District Drainage Board) said it was interesting to hear this battle of twenty years ago fought over again. They could now deal with the question with less bias, and he thought they

could admit there was a good deal to be said for all systems. He had been very interested to hear their old friend Colonel Jones, who was a veteran on this subject, but he was sorry indeed to hear that the War Office had not thought it prudent to continue him in office because he had become an octogenarian. He (the speaker) thought it was a mistake, because Colonel Jones had done good work at Aldershot. But they must not run away with the idea that, because at towns like Leicester and Nottingham, where they had land suitable for the purpose, land treatment was a success, they could purify the sewage of other great towns in the same way. There was one thing about the paper which he did not like. There was a tendency to sneer at the Royal Commission. The commission had done most excellent work—in fact, invaluable work—and if anyone in the room had read the whole of the reports he ought to get on his legs and speak, for in those reports they had the Alpha and Omega of the question. In them they had everything that could be said about sewage treatment, and the commission had approached the question from a most unbiassed point of view. There was not a single word in the reports against land treatment; on the other hand, they had appraised the different systems in a most excellent manner, and the very fact that they had sat and investigated the question for twelve or fourteen years was in itself evidence of the great amount of work that had to be done and close study that had to be made of the experiments of the various people interested in the work. He always felt it was necessary for a body like the Royal Sanitary Institute to express its mind with regard to the work of the Royal Commission, and express their appreciation of the work done.

Mr. R. W. Cass (Farnham) said they had a farm near Aldershot which had been very successful. It had been in existence for about twenty-five years, and was still as good as ever. What he wanted to know was whether, provided they had a good farm, there was more possibility of smell arising from it than would be the case with artificial works.

Dr. Fowler (Manchester) said that one difference between natural and artificial treatments which ought to be emphasised was that even under good conditions the results from a sewage farm were not always what they might appear to be. If they had land freshly ploughed and sewage was turned on to it for a certain period the effluent from it would not be good. At Wolverhampton the works manager and chemist, Mr. Clifford, had shown him a series of figures proving that, on any day, it would be possible for an inspector to go to the farm and take a bad sample—if he went at the right time. At the recent annual meeting of the Association of Managers of Sewage Disposal Works at Wolverhampton they saw a beautiful effluent going into the stream, but at any one of the numerous outlets on the farm the effluent would probably not be as good as that elsewhere, owing to the soil having been recently turned, allowing the sewage to get through. That showed the necessity for careful management. He would say this for land treatment: a great deal of the prejudice against it was due to the fact that the same scientific care had not been bestowed on it as had been the case with the more modern methods.

Mr. John Manley said it had not been his intention to condemn artificial schemes unnecessarily. He had no object in inducing any engineer to give up a system that was dear to him in favour of land treatment; his desire was to suggest that more attention should be given to the latter in certain cases. The mention of the word "sneer" had rather surprised him. He had certainly not thought of sneering at the Royal Commission, for he himself had derived not a little information from their reports. Mr. Manley added that the Blackwater river, into which the effluent from the Aldershot Camp farms flowed received sewage from the town of Aldershot. Samples had been taken by the Royal Commission both above and below the point of discharge, as well as by the Thames Conservancy afterwards, and it had been reported that the water below the camp sewage farm was purer than the water above, which contained the discharge from the town sewers.

ONE SOLUTION OF THE SLUDGE PROBLEM.

This was the title of a paper—also reproduced in our issue of last week—by Messrs. Arthur Hindle, M.Inst.C.E., and P. Holt Whitaker, Assoc.M.Inst.C.E., which was next considered by the conference.

Mr. S. S. Platt (Rochdale), who opened the discussion, said he supposed the litter to which reference was made in the paper was employed as a filter in addition to being used as manure.

Mr. R. W. Cass (Farnham) stated that he had had some difficulty in disposing of sludge. But they had adopted the method of building a thick wall of town's refuse round the sludge. The liquor drained away through this, leaving behind a material which made an admirable manure, for which the farmers willingly paid from 9d. to 1s. per load. The material was built up to a height of 7 ft.; there was no handling, the sludge simply being pumped in until the requisite amount had been deposited.

Colonel A. S. Jones, v.c., observed that they had used the litter from cowsheds in a similar way.

Mr. J. S. Brodie (Blackpool) pointed out that the authors had stated that the amount of wet sludge passed on to the beds was 2½ tons per day on the average, and the quantity of dried sludge taken out 16 cwt. He would like to know what was meant by dried sludge in that connection. He took it there was a considerable amount of moisture left in the sludge. With regard to the price obtained for the sludge, he presumed that it was 1s. 9d. at the works, and that contractors themselves removed the sludge from the beds.

Councillor A. Upson (Maidenhead) inquired the cost per ton of disposing of the wet sludge.

Alderman T. Burton (Warrington) inquired whether there was any discernible smell arising from the collection of the sludge.

Mr. Hindle, in the course of a short reply, said the moisture in the dried sludge amounted to between 35 and 45 per cent. The price of 1s. 9d. was, of course, at the works, and the contractor undertook the removal of the material, besides providing the litter required. He could not give the cost of disposing of the wet sludge; the whole operation really only consisted of the opening of a valve. There was no smell, except when the inlet valves were first opened, when there was some little odour in the immediate vicinity. The sludge, after being dried, was quite portable, and reached its highest value after an interval of twelve months. It could be cut into like hay after that lapse of time.

BLACKPOOL SEWER OUTFALL EXTENSION.

The paper on the Extension Seaward of the Gynn Outfall Sewer at Blackpool, which we also printed last week, was productive of an interesting discussion.

Mr. E. R. Matthews (Bridlington) said he considered the paper one of the most important and interesting the conference had had before them. Coming from a seaside town where they had two or three outfalls laid on the foreshore, he was naturally interested in the construction of such a work. He would like to know if Mr. Brodie had found the coating of the tubes with the bituminous preservative effective. He (the speaker) had laid a 30-in. outfall with flanged pipes, but from inquiries made he had found that a good report with regard to the use of steel tubes was not forthcoming, and therefore did not recommend their adoption to his committee. Did Mr. Brodie consider Karri wood the most suitable material for carrying the sewer? What distance below low-water mark of ordinary spring tides did the pipe extend? He did not see the object for the timbering. He would like to know also what was done with a view to holding down the pipes. He knew there were bedplates at the side at distances of 18 ft. Was the object to keep the pipe down so that a rough sea would not lift it?

Mr. H. Gilbert Whyatt (Grimsby) said he was rather interested in this matter because he might have to carry out a similar work himself in a short time—but in an estuary instead of deep-sea water. He questioned whether steel was the right material. The cost of the work at Blackpool had been only £1,950, and at that rate it might be worth considering whether it would not pay the town periodically to reconstruct instead of meeting the cost of what might be a more permanent undertaking. He would like to know whether the work was done in one tide or whether the operations occupied two or three tides. The work was stated to have been carried out on a specially high spring tide of 24 ft., which necessarily included a specially low tide. Was the whole length bare at the time, or a part of the pipe dropped into the water at a time and left to take its chance?

Councillor Dyer (Bridlington) asked whether the

steel pipes would last as long as cast-iron pipes in sea water.

Mr. T. W. Stainthorpe (South Africa) mentioned that some years ago he carried a sewer over the foreshore of the river Tees. He made use of cast-iron pipes; therefore he asked Mr. Brodie whether he thought he had adopted the right material in steel, and if the Local Government Board approved of it? Also had he considered the question of employing ferro-concrete in place of Karri piles?

Mr. C. Brownridge (Birkenhead) asked what kind of bituminous compound was used for covering the pipe? Also why had he not carried his cradles or slings further towards the end of the piles? Had he had any evidence of the pipes at the end sinking further in to the sand, or did the bed plates prevent that? Of course, Mr. Brodie had a special kind of foreshore to deal with, and his method could not be adopted in its entirety universally. It would be valuable, added the speaker, if Mr. Brodie could tell them the depth of the sand, and what was the nature of the subsoil. It was a practical paper, and he thanked the author for the excellence of it.

Mr. J. S. Munce (Belfast) joined in the commendation of the paper. He wished to inquire whether Mr. Brodie was not asked to level the foreshore alongside the pipe. He considered the author of the paper had done the right thing in adopting steel, and instanced a case in his own city in which a saving of £1,500 had been effected by the employment of steel covered with jute in preference to cast-iron. Their experience was that steel pipes were far superior to cast-iron pipes for foreshore purposes.

The President (Mr. A. D. Greatorex), in closing the discussion, said he had had occasion lately to relay an important main sewer owing to mining operations. In that work he adopted steel, for the reason that he was anxious to make the sewer act almost like a bridge in the event of future subsidences.

Mr. Brodie, replying upon the discussion, said, with regard to the bituminous material employed in coating the pipe, that he took very special care to get the best preservative to be found in 1907. Its efficiency was guaranteed by the makers of the pipes. Since the work was completed he could entirely corroborate what they had said, for the closest examination had failed to indicate on the exterior of the pipes any injury having been done to them. He could not speak as positively with regard to the interior of the pipes, but, as far as they were able to judge by means of the manholes, there was no indication either of anything having affected the metal. In regard to the piles, they had made use of pitch-pine at Blackpool, but the wood was very much worm-eaten, and was being replaced by Karri as occasion arose—which, he was sorry to say, was very frequent. In regard to the timbering for short lengths, that was done in 1907 at the suggestion of the Local Government Board. They proposed they should timber and introduce the steel straps which were made to fit the curvature of the piling merely for purposes of laying. He thought it a very sagacious suggestion on the part of the engineers to the board. The intention was simply to ensure the pipe being laid closely up to and against the surface of the old outfall pipe. They found that it answered as perfectly now as it did in 1907. The pipes had to be laid in one tide or they could not be laid at all. They had one or two false starts—that was to say, they did not float off because of the rough sea—but on a third attempt the sea was sufficiently calm, with a south-east wind blowing, that the work was done without a hitch. The pipe was towed into position at or near the time of high water, and at the fall of the tide was dropped exactly into the place prepared for it. In the final operations the assistance of a diver was unnecessary, but in any future extension this would be required. Answering the question with regard to the nature of the subsoil, Mr. Brodie said there were 6 ft. of sand, with a stiff yellow clay underneath. No difficulty was experienced in keeping the pipe ends clear. In reply to Mr. Stainthorpe, the site of the work was not one in which he would have suggested the use of ferro-concrete piles, and as to Mr. Brownridge's question, the cradling was carried to the point it was at the suggestion of the Local Government Board.

(To be continued.)

Londonderry's New Guildhall. The ceremony of opening the council chamber of the new Guildhall at Londonderry was performed last week.

STATISTICS OF COST OF ROAD MAINTENANCE.

THE IMPORTANCE OF RECOGNISING DEFINITE FACTS RELATING TO THE INFLUENCE OF VARIOUS CONDITIONS UPON COST AND EFFICIENCY.

Amongst the subjects to be discussed at the Third International Road Congress which will be held in London next year is: "Statistics of Cost of Road Construction and Maintenance." Communication No. 9. (See p. 18 of The Surveyor, July 5th, 1912.)

It is, of course, mainly in its administrative aspects that this matter demands attention, in order that light may be thrown upon the nature of the service performed by roads of certain classes or in certain localities, and the way in which the burden of their upkeep is distributed amongst taxpayers and ratepayers. It must not be forgotten, however, that, besides being able to work forward from statistics to financial and administrative considerations, we can also work backwards towards the physical facts upon which the statistics are based. A particular road costs so much a mile as the result of the interplay of different forces, some wholly favourable, some always adverse, and others which are sometimes favourable and sometimes adverse, the actual effect depending partly upon conditions immediately preceding and partly upon the other factors which come into play at the same time. There is, for instance, probably some county in England the rainfall of which, having regard to its amount and its distribution, is a favourable factor compared with the rainfall of Essex or of Breconshire; and there may be places where the topography is such that the effects of greater or less rainfall may be compared on roads on similar soils and in other respects similarly situated. The rainfall cannot be controlled, but we cannot judge of the effects of conditions which we do control unless we know what are the effects of the conditions that we cannot control.

The effects of various conditions upon the wear and deterioration of roadways are to be discussed under subsection C, but it is suggested that some statistical recognition of them may be possible with the materials now available, but scattered about the country, and that important economies might in some cases follow the recognition of effects which may here and there be disclosed by the costs accounts of surveyors. It is understood, of course, by all who have given attention to the matter, that surveyors generally have not been provided with the funds or the staffs necessary for the keeping of detailed costs accounts, but it is at the same time probable that the costs of maintenance of separate stretches of road in the same district are known with sufficient accuracy to make a comparison possible when the conditions affecting the different roads are so nearly similar that the influence of the factors that are not similar can be definitely traced. If, for instance, a length of two miles of undulating road crossing the spurs of a long hill is succeeded by a mile of the same road, with the same traffic, along a contour of the hill, and nearly level throughout, we may, if the costs accounts relate separately to these two portions, find that the road with an average gradient of 1 in 80, and some dead flats, costs so many pounds a year more than the similar stretch with an average gradient of 1 in 30. It is obvious, however, that where there are many differences in the conditions it is impossible to trace the effect of any one of them so definitely, either as regards the average state of the road or its annual cost.

It is not suggested that the costs accounts of every road should be kept for every odd length that happens to coincide with some natural condition, such as slope or subsoil; but it is suggested that where an arbitrary division falls near a spot where a marked change takes place, it may be moved to that place, so that the influence of different conditions may be gradually seen in the costs accounts. In other cases, stretches of road which are of the same character throughout may be selected as worth the trouble of keeping apart in the accounts. If, for instance, a surveyor could prove that a piece of road in side cutting cost £15 a mile on account of seepage water alone, he would have made out a case for the purchase of the land necessary for a catch-water drain and the expenditure needed to provide suitable culverts. Such figures must, of course, be used with common sense, and cost is not always the criterion; but the same separate contemplation of well-defined lengths of road as is useful in ascer-

taining differences in cost will help the surveyor to estimate the value and importance of factors affecting the comfort and convenience of users of the road. Apart altogether from the keeping of accounts in a manner intended to test the importance of different factors, there is, it is believed, a considerable amount of information available in the accounts as now kept in some counties and districts, and if during the next few weeks some of this information could be published in THE SURVEYOR it might form the basis of a suggestive and valuable Note in the Report to be presented to the International Road Congress next year, even if this note were no more than a reference to those issues in which the information appeared. The best way in which to give the information is to compare stretches of roads in pairs, each pair having similar and as nearly as possible the same amount of traffic, and differing in not more than one important circumstance. The difference in effect may be noted as one of the average state of the road, or as a difference in cost of upkeep.

SUGGESTED COMPARISONS.

The following are suggested as some of the comparisons which may be made, but any others which occur to readers of THE SURVEYOR may be noted in addition.

Nature of the Subsoil.—The actual difference in annual cost of maintenance due to a change from sandstone to clay, for instance.

Lengthwise Slope.—A dead flat may be compared with a steep slope as regards both cost and the state of the surface: and a very steep slope compared as regards cost with a moderate slope.

Surface Water Drainage.—A well drained road may be compared with one which remains waterlogged after rain, or with a road which is damaged by too rapid or too concentrated drainage along the edges of the crust, due to lack of outlets or an inadequate side drain. A length with proper ditches and outlets may be compared with a narrow road which acts as a watercourse whenever there is heavy rain.

Drainage of Crust and Soil.—Suitably drained lengths may be compared with lengths which are soaked with seepage water during and after wet spells, or with roads on embankments so narrow that they suffer in droughts, or from heavy rain following drought.

Material of Crust.—Valuable figures are available for whole districts or for single long roads; but definite comparisons of similar lengths during the same season would have a further value.

Width of Carriageway.—A length of suitable width compared with a length of road having a carriageway so narrow that the traffic is unduly concentrated, causing increased wear, or with a carriageway so wide that there is undue loss by weathering and occasional damage. Such a length of road is sometimes found where there is not enough width for the making of turf margins, although a carriageway from bank to bank or from hedge to hedge is somewhat too wide for economy.

Width between Fences.—A length having sufficient width may be compared as to cost of maintenance with a road having insufficient width and suffering from (*a*) lack of support between the edges of the crust and the ditches, involving frequent repairs, (*b*) no room for side ditches, (*c*) no room for the management of fences or for the overhang of vehicles, so that wagons carrying wide loads are diverted too much to the middle of the carriageway, (*d*) walls, close palings or banks, surmounted by thick hedges too close to the carriageway for the proper circulation of air to be maintained.

Shade and Exposure.—Generally definite comparisons between lengths of road having suitable trees properly spaced apart and standing at the right distance from the carriageway, with lengths of roads having trees too densely planted having regard to soil and situation, or planted in such a way that they exercise a bad influence upon the road.

Care must be taken in making these comparisons that the two stretches of road are not otherwise dissimilar.

Another point on which information as to cost of maintenance will be valuable is the effect exerted by hedges and trees in preventing winter or spring sunshine from thawing the surface of a road. The consequent licking up of the surface is recognised as an inconvenience, and the question arises as to whether it can be measured as an expense.

As regards summer and early autumn conditions, comparisons are needed between lengths of road which are shaded by suitable trees spaced in a manner conforming with the circumstances of a locality and other lengths fully exposed to sun and air. Can, for instance, any surveyor provide an example of a length of road costing more than some other length simply because it is too much shaded by trees or bushes? Or can anyone provide an actual case in which a length of road which goes to pieces in droughts has cost more to maintain than a neighbouring stretch which is similar in all respects except that it is shaded by large trees set closely together?

Wear and Tear at Edges.—A length with weak or insufficiently protected edges may be compared with a length having edges well protected and of adequate strength.

Other Comparisons.—Any other comparisons which may suggest themselves, or which demonstrate facts found to be of importance in the maintenance of roads, will be welcomed.

POLLUTION OF STREAMS BY COAL-WASHING WATER.*

By H. MACLEAN WILSON, M.D., B.SC.,
Chief Inspector, West Riding Rivers Board.

Coal as it comes from the pits often contains a considerable admixture of impurities, such as shale, clay, and pyrites, which greatly reduce its value, and especially so in the case of coal which is to be converted into coke for use in the iron and steel industries. The larger pieces of stone and shale can be picked out of the coal by hand, but when the coal and its impurities are broken up into small pieces this method of separation is impracticable, and it becomes necessary to wash the coal. The impurities are almost invariably of greater specific gravity than the coal, and when a mixture of small pieces of the two is agitated in water they gradually separate into two layers, the coal at the top, and the "dirt" at the bottom. All washing machines are constructed to take advantage of this difference of specific gravity, and are so arranged that the dirt is discharged from one part of the washer while the coal issues with the water from another part. The coal is separated from the water either by straining or settlement, but the water which finally escapes usually carries with it large amounts of fine coal in suspension.

In order to safeguard the streams and to recover as much water as possible, it is advisable, at every colliery, to have final settling tanks or ponds situated as low as circumstances will permit, so as to be available for the interception not only of the surplus water from the washers, but also of the surface drainage from the whole of the colliery premises. These ponds can readily be constructed by forming banks across a small valley or around a flat area with the spoil from the pit. The waste waters when turned into such a pond will percolate through the banks, and, thus filtered, may be made fit to discharge to a stream, or to be reused at the colliery. When the pond becomes full of settled solids its banks can easily be raised by further tipping. In some cases, ponds of this kind have been made ¼ acre in area, and with banks 25 ft. high.

It is gratifying to find that the measures of purification adopted by colliery proprietors have resulted in a great saving to them. When the dirty water from the washers was discharged untreated to the streams a much larger quantity of water was needed for washing the coal, and it carried with it a large amount of good coal in suspension, amounting in some cases to 200 tons per week. This coal is now almost always recovered and mixed with the washed coal. Where this is not done it can be used for burning in the colliery furnaces.

East Northumberland Water Supply Scheme.—A scheme of water supply, which it is proposed to carry out on a co-operative basis amongst local public authorities, is being developed in East Northumberland. The proposal is to form a joint water board to secure Parliamentary powers for utilising water from the Simonside Hills, at Great Tosson, and from the River Alwin.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

262. Wood Paving.—What contour should be given to a wood-paved (soft wood) road 60 ft. in width? Describe the best method to adopt in fixing the screeds. (A. B.)

264. Concrete Beam.—A concrete beam reinforced with steel rods is to be designed to carry a distributed load of 20 tons. The span is 15 ft. Show by calculations what size of beam you would use—the method and formulæ to be as simple and short as possible. ("Greenland Farm.")

265. Strength of Shafting.—A 10-in. shaft has a 4-in hole run through it; what fraction of its weight is removed? To what extent is its strength in resisting torsion affected?

266. Surveying.—Describe in detail the operation of measuring a horizontal angle with a theodolite. ("Surveyor.")

REPLIES TO QUESTIONS.

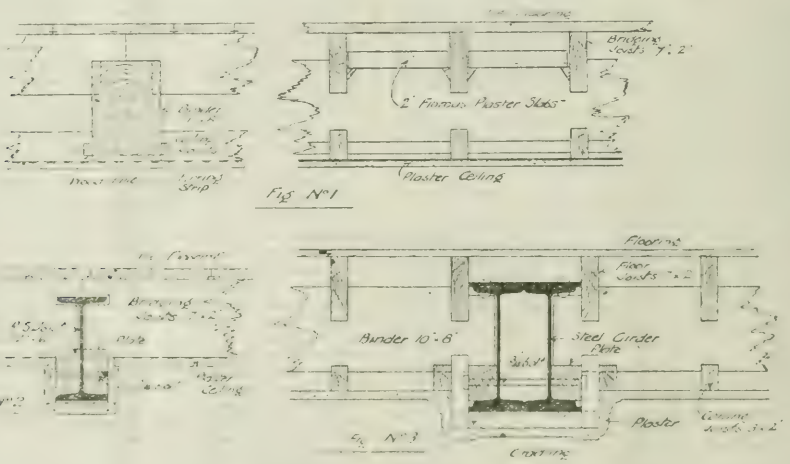
260. Refuse Disposal.—Where there is no system of sewers in a district, what are the best methods of collecting, removing and disposing of the fluid and solid refuse from the community?

For the removal of refuse from a community placed under such circumstances, the pail system for the solids and watertight cesspools for the liquid refuse, is the best and only successful method. No particulars or circumstances being given, the following is written under the impression that the local authority carries out the removal. In that case each house should be fitted with sufficient closet accommodation to successfully meet the requirement of the occupiers.

The closets should be well ventilated with the "aerolite" or other suitable type of ventilator and should have local impervious floors, consisting of concrete or other suitable material. The floor should be laid so as to have a fall towards the doors. The part underneath the seat should be slightly raised, thus causing the pail to fit tightly against the underside of the seat, an arrangement which goes a long way towards keeping the floor dry on the underside. The seat should either be made so as to allow the pail to be removed from the top or, better still, it should have a small door placed at the back through which the night-man can remove the pail without entering the closet. These pails should be emptied periodically at least twice per week, and at night. The contents should be taken away in a closed cart to a suitable isolated spot, and there treated either with lime or by some other suitable method. Where water-closets and sinks are in use it is necessary to construct watertight cesspools to receive the liquids as well as the solids, and these also must be emptied periodically at night time and taken away. The best method to adopt for emptying cesspools is that of pumping by compressed air into an airtight tank on wheels, thus preventing any nuisance from smells. The liquid part of the contents may be used for garden purposes by fixing a pump to the cesspool, thus drawing the liquids off and leaving the solids behind. In any case overflow pipes must not be allowed, otherwise the liquids will percolate into the soil, thus causing serious danger to health.

With regard to the treatment of the refuse, it is generally taken some distance away from any habitation, on to a piece of ground having a series of ploughed furrows, prepared, into which it is emptied, quicklime being added. After a time the refuse is ploughed into the land and fresh furrows made to receive the next dose. In some places the ashes and house refuse from the community is mixed with it and allowed to get fairly firm, and then carted away to go on the adjoining agricultural land.

If there were enough refuse to warrant the use of a small destructor, this would be the best and most sanitary method, but in that case a sewerage system would probably be installed. (C. F. B.)



Floor Construction.

263. Floor Construction.—Give sections showing clearly the construction of a double floor and a framed floor respectively. ("Junior.")

Double Floors.—Figs. 1 and 2 give sections showing two methods of forming double floors. Such floors are used where the span exceeds about 16 feet, although Tredgold gives it as his opinion that to ensure stiff ceilings single floors should not have a greater bearing than 12 feet. Where timber binders are used (as in Fig. 1) they should be given to ensure a free circulation around their ends in order to prevent dry rot and maintain the floor in a state of efficiency. Fig. 2 shows a R.S.J. as a binder and the underside of the girder cased with wood. It is not usual to place the binders at greater intervals than 10 feet. Fig. 1 also shows a modern

method of sound proofing by using fibrous plaster slabs resting on wood fillets. It is now quite usual to construct all large floors as double floors; this is due to the present-day facilities for obtaining steel girders of any convenient size and section.

Framed Floors are principally used in large buildings such as hospitals, banks, halls, &c. Fig. 3 shows a section of such in which the girder is formed of built-up steel sections.

In consequence of the introduction of steel and the desire for fire-resisting buildings, floors composed of reinforced concrete or steel sections embedded in concrete are rapidly superseding the older forms of construction in which timber was a constructional factor. (H. F. W., *Tottenham.*)

Tramway Trailer Cars. The London County Council Tramways and Improvements Bill, one of the provisions of which allows an experiment to be made with trailers and coupled tramway cars on the South London tramway system, was read a third time and passed by the House of Lords last week.

Business Announcement.—Mr. S. H. Morden has opened offices at Broad Sanctuary Chambers, 11 Tothill-street, Westminster, and has been appointed sole London agent to the firm of Musgraves (Liverpool), Limited, of Liverpool and Newcastle-on-Tyne, sanitary engineers and manufacturers of "Invicta" porcelain enamelled fireclay ware and every description of sanitary appliances for use in hospitals, schools, asylums, and other public buildings.

Lord Crewe on Town-Planning. Delivering the opening address at the Summer School of Town-planning, which is about to be held at the Hampstead Garden Suburb, Lord Crewe on Saturday last observed that it was gradually being realised that the by-laws of local authorities were made for mankind and not mankind for them, but a good many angularities still existed, and it might be some time before the path of town-planners was made as easy as it should be. Referring to the creation of the new capital of India at Delhi, he said that to be convenient and suited to the Europeans who had to work there it could not be planned in a manner altogether foreign to Western ideas and Western life; at the same time, it must not be hostile in appearance or in spirit to the Mahomedan ideals of the past. Therefore, when the actual architecture of the new city had to be considered it would be clearly no easy task for the architects engaged upon it to combine the old and new in a manner which was necessary if a truly satisfactory result was to be achieved. In the meantime they had proceeded some little way in the planning and laying out of the scheme for the main parts of the town.

ROAD BOARD'S POLICY.

THE POSITION OF THE BOROUGHS.

Mr. L. S. McKenzie, city engineer, and Mr. W. H. Wise, assistant to the town clerk of Bristol, who on the 19th ult. attended a deputation to the Road Board, arranged for by the Association of Municipal Corporations, have reported to the city council as follows: "The objection of the association to the policy of the board was that, while considerable sums were being disbursed from the road improvement grant towards improving the road surfaces in rural areas, no money appeared to be available for road improvements within the areas of municipal boroughs, and the object of the deputation was to discuss the matter with the Road Board and to endeavour to induce them to change their policy.

"The deputation was received by the chairman (Sir George Gibb) and other members of the Road Board, and the case for the boroughs was presented by Mr. Fox (town clerk of Leeds).

"In reply, Sir George Gibb pointed out that at present the income of the Road Board was comparatively small, and he stated that the views of the Board were: That it was quite fair to give attention to the rural districts first, because there was no doubt that the rural roads, which were not constructed to carry motor traffic, were being rapidly destroyed, and the strengthening of the road surfaces was an urgent matter in order to avoid irreparable damage. On the other hand, municipal authorities were already bound at their own cost to maintain strong road surfaces in order to carry the normal traffic of their boroughs, and had therefore no claim on the road grant for that purpose. With regard to road widening, the board intended each year to allocate a share of the grant towards this object in boroughs, but they were opposed to doling out the money simultaneously to a number of borough councils to assist the promotion of small schemes, on the ground that the amounts would be so small that no tangible good would result. They preferred to take up a single scheme each year, and to devote to it the bulk of the fund available for road-widening. They had accordingly selected London this year, as being the most important place, and had agreed to contribute £875,000 towards the construction of a new road there, the estimated cost of which is £1,500,000. Having completed that scheme, they would proceed to deal with other towns."

Croydon and Motor-Omnibuses. The Croydon Borough Council have decided to seek powers to tax motor-omnibuses running in the borough.

Shorland's Patent Manchester Stoves and Ventilators. The new isolation hospital, Staines, Middlesex, is being supplied with Shorland's patent warm-air ventilating Manchester stoves with descending smoke flues, patent exhaust roof ventilators, and special inlet ventilators by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

Surrey County Council and District Road Improvements. The Highway Committee of the Surrey County Council at the last meeting of the latter body reported as follows: "The committee have had under their consideration the principle of contributing to improvements carried out on district roads in the county, the practice hitherto, with the exception of making contributions to bridges on district roads, having been to recommend contributions to improvements on main roads only, the amount of such contribution being generally one-third of the actual nett cost falling on the local authority. There is no doubt that, owing to the great increase of traffic in recent years, certain district roads in the county are now carrying an enormous volume as compared with past years. Under these circumstances your committee feel that the burden of the full cost of the improvement should not fall entirely on the local authority, and it is recommended that in regard to all future applications for contributions to improvements on district roads in the county, the county council will, with regard to such improvements as they may approve, contribute one-fourth of the actual nett cost falling on the local authority upon the certificate of the county surveyor that the work has been properly executed." The recommendation was agreed by the county council.

Law Notes.

Edited by J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

Contract with Local Authority: Absence of Seal.—Some important questions as to the effect of an unsealed contract between a landowner and a local authority were decided in *Hoare* v. *Kingsbury Urban District Council* (Chancery Division, Mr. Justice Neville, July 5th). The plaintiff was the owner of a building estate abutting on a 20-ft. road, on a higher level than the land known as Stag-lane, and deposited plans for the erection of thirty-six houses. The chairman of the council suggested that the plaintiff should set back the houses, remove the hedge between his land and the road, level up the land, and throw a strip 20 ft. wide and 1,000 ft. long into the roadway, in consideration of which the council would adopt the strip and make up the widened road at their own expense. The plaintiff fell in with this suggestion and signed an agreement embodying the terms of the arrangement which was drawn up by the chairman. The agreement and plans were submitted and duly approved at a meeting of the council, and both parties proceeded upon the footing that they were bound thereby. The plaintiff duly performed his part of the agreement, and the council erected three gas lamps on the added strip and obtained the sanction of the Local Government Board for a loan to make up and sewer Stag-lane, and advertised for tenders, but proceeded no further. The plaintiff, after repeated applications to the council to perform their part of the agreement, brought this action for specific performance. The council then for the first time raised the question that they were not liable because their seal had never been affixed to the agreement, and this was their main defence. They also pleaded the Statute of Frauds. On behalf of the plaintiff it was contended—(1) that the agreement was not a contract within the meaning of sec. 174 of the Public Health Act, 1875, and therefore did not require to be sealed; (2) that the agreement was entered into with the council as the highway authority, and not as the sanitary authority, and therefore the section did not apply; (3) that there had been a sufficient part performance of the agreement to take it out of the Statute of Frauds; (4) that the contract was not necessarily of the value of £50 and upwards and so that the council were estopped by their own acts from repudiating the agreement. Mr. Justice Neville, however, though he agreed that the council could not rely on the Statute of Frauds, held that they were not estopped from setting up the defence that the contract had not been sealed. He held further that the agreement was made with the council as urban authority, under the section, and was for more than £50 in value, and therefore, not being under seal, it could not be enforced. The action was accordingly dismissed.

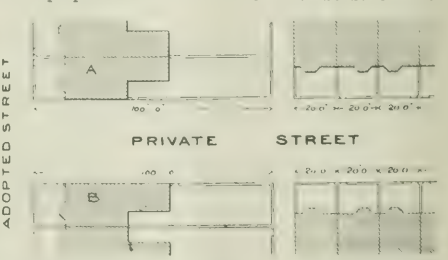
QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, *combinations such as* X.Y.Z., *and words such as "engineer" and "surveyor," should never be used.*

Surveyor to Urban District Council: Duties: "Whole Time": Private Street Works.—"L. Q." writes: (*a*) Council Surveyor: Extra Services.—My council instruct me to prepare plans, sections, specifications, quantities, estimates, and apportionments for making up a number of private streets (value, say, £11,000), but they object to making any grant for extra services. I maintain that such work is outside and in addition to my ordinary work as their surveyor, and that I ought to be paid extra for such services. Am I not justified in asking for extra remuneration, and are not grants to surveyors a usual proceeding all over the country? (*b*) Surveyor's Whole Time.—My council say that I undertook to devote my whole time to the duties. I maintain that "whole time" means that I should not undertake private work. The clerk says that it means days and nights. The council take up most of my nights attending committees held at 6.30 p.m. to about 9 or 10 p.m. Am I not entitled to extra pay for overtime at nights? (*c*) Making Private Streets previous to Commencing to Build Houses.—Can my council insist upon new private streets being properly made and sewered before any houses are built? This is enforced in some urban districts, and they have no special Act under which they can act. In this district houses are built first, and the streets are afterwards made, a portion at a time, the consequence being that the houses are not built to proper levels, and when the streets are eventually made up there is a difficulty in obtaining proper gradients for the roads and footpaths.

(*a*) Under sec. 189 of the Public Health Act, 1875, the urban district council have power to make regulations with respect to the duties and conduct of their surveyor, which regulations do not require confirmation by the Local Government Board. Upon the appointment of a surveyor a committee or sub-committee usually draw up the regulations. A specimen list of the duties of a surveyor, emanating from an important English borough, is given in Mr. H. Percy Boulnois' "Municipal and Sanitary Engineer's Handbook" (3rd Edition), pp. 14-17, and in this list is included the preparation of plans, sections and specifications for flagging, paving, sewering or other works, and the superintending of the works. I do not know whether or not extra grants to surveyors for such work are usual (perhaps some readers of these notes will communicate their experience), but I should think this work (in the absence of any stipulation to the contrary on the surveyor being appointed) would usually be included in the ordinary duties of a surveyor. Sec. 150 of the Public Health Act, 1875, provides that the urban authority shall cause plans, &c., to be prepared under the direction of their surveyor, and the Private Street Works Act, 1892, provides that the surveyor shall prepare specification, &c. (*b*) In the above-mentioned list of duties is also included attendance at the meetings of the several committees when required. I think "whole time" includes all such time as is reasonably necessary for the effective discharge of the duties, and that payment for overtime could not be claimed, except perhaps in very exceptional circumstances. (*c*) Certainly. The powers of sec. 150 of the Act of 1875 (or of the Private Street Works Act, 1892, if adopted) are exercisable whether houses have been built in a street or not.

Private Street Works Act, 1892: The Benefit Principle.—"Equity" writes: I am instructed by my council to prepare plans, &c., for the making up of a private street, part of which is roughly shown on the plan forwarded. It is felt by some of the members of my council that a hardship will be inflicted on the frontagers owning the property marked A and B, commonly called "return frontages," inasmuch as they each have about 100 ft. of frontage, which includes the building and a back garden, while the remainder of the houses in the street have only 20 ft. frontage each; moreover, the frontagers A and B have already paid their proportions of the cost of the works in the



adjacent adopted street. May I ask your kind advice on the following points: (1) Can the argument that frontagers A and B have not a "benefit" in proportion to their frontages be well sustained? (2) If yea, and an apportionment is made according to the "degree of benefit," instead of according to the frontage, could an objection from the remaining frontagers be sustained on the score of the additional expense thrust upon them? (3) In the case of a street having none but "return frontages" who should bear the relief, if any, granted to them? (4) Would it be a correct application of the words "Contribute . . . a portion" in section 15 of the Act to relieve the individuals A and B, or the return frontagers assumed in 3, at the expense of the general body of ratepayers?

(1) So far as can be judged from the plan, and without knowledge of the locality or any special circumstances affecting the question, it would appear that the premises A and B will not derive five times as much benefit as the other premises from the works, and unless they do so it is clear that they will not benefit in proportion to their frontages. (2) It would be open to the other frontagers to raise an objection under sec. 18 (5), but it does not follow that such an objection would succeed merely because of the extra expense which would otherwise fall upon the objectors. If no application of the "benefit" principle entailing additional expense on some frontagers

were to pass muster that principle could never be applied at all. (3) and (4) It would appear that under sec. 15 the authority can only pay "the whole or a portion of the expenses" taken as a whole. That is to say they can pay all, or half, or a quarter, &c., of the entire cost, but not the specific amount applicable to any particular frontager or frontagers. Where a street has none but return frontagers this would enable the authority to relieve them of the whole or part of the expenses. But in the present case the section would apparently not enable the authority to relieve A and B individually. For this purpose the "benefit" principle must be adopted under sec. 10. See "The Law Relating to Private Street Works under the Act of 1892," by W. Carlyle Croasdell, p. 129.

By-Laws: Thickness of Walls: "Topmost Storey."—"E. B." writes: In Model By-laws, sec. 20, sub-section 7, it states: "Nevertheless in walls not exceeding 30 ft. in height the walls of the topmost storey may be 9 in. thick provided the height of this storey does not exceed 10 ft." Will this allow a building to be built with walls 9 in. thick provided the height of such building does not exceed 10 ft., or do the words "topmost storey" apply only to the case of a building with more than one storey?

In my opinion this clause only applies to buildings of more than one storey. To apply the term "topmost storey" to a single-storey building would be incorrect.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

BLACKPOOL CLEANSING DEPARTMENT.

SUPERINTENDENT'S REPORT.

Mr. James Bee, superintendent of the Blackpool cleansing department, in his annual report states that the quantity of refuse dealt with at the destructor last year amounted to 18,372 loads, the weight of which was just over 18,943 tons. This quantity, though considerably below last year with regard to the number of loads removed, is only a slight decrease as regards tonnage, the figures for 1910-11 being 18,734 loads and 19,000 tons. The difference is accounted for by the carts taking larger and heavier loads.

There has again been a slight reduction in the cost of dealing with the town's refuse, which during the year averaged 1s. 0¾d. per ton, whereas the average cost per ton for the previous year was 1s. 1d. It is worthy of note that the cost has gradually decreased from 1s. 6¼d. per ton in 1906-7.

PROFITS FROM BY-PRODUCTS.

There is, it appears, a steady increase shown in the profit-earning by-products.

"I have pleasure in being able to report," says Mr. Bee, "that the tremendous increase which has taken place within the last half-dozen years in the revenue from the sale of products at the destructor has been maintained. During the year the unprecedented sum of £1,660 was derived from this source, an increase of £55 on the income obtained from last year's sales. To show the wonderful possibilities which lie in what is apparently the waste material of the town, it is only necessary for me to point out that during the year 1904-5 we were deriving what was then considered the respectable sum of £248. We have thus increased our revenue in eight years by £1,412."

A table of statistics shows how the money is obtained. Compared with 1910-11, there are considerable decreases in the sale of ashes and clinkers and mortar, but the yield from fish manure has risen from £558 to £815, which brings about the total increase. During the year 2327 loads of ashes and clinkers were disposed of, a decrease of 782 loads, which represent a loss of revenue of £102. The quantity of mortar manufactured was 1,490 tons, or 570 tons less than last year, which created a record by bringing a revenue of £470. This year the amount was £330.

DUST COLLECTION.

The work of removing the town's refuse has again been carried out in a satisfactory manner, a daily collection having been maintained in connection with the hotels, hydros, restaurants, and the larger boarding-houses; while from the ordinary company-houses the refuse has been removed from two to three times weekly. All other premises have had attention weekly.

During the year 202 large and 114 medium galvanised iron dustbins have been sold at practically cost price, to replace the less sanitary wooden receptacles.

The collection of waste-paper by means of a duplicate set of bags still continues to prove satisfactory. The experiment, which was tried at the beginning of the year, of allowing waste-paper to be collected by private enterprise, proved so inconvenient to tradesmen that it had to be speedily discontinued, and the work again taken over by the corporation.

The cost of refuse removal has been £5,360, divided into: Labour £2,017, carting £1,682, and hire of horses £1,661. The amount required for this work last year was £5,286, divided into: Labour £1,981, carting £1,621, and hire of horses £1,684. The cost of removal per ton is very little different from last year, labour having cost 2s. 0½d. per ton, carting 3s. 5¼ per ton, making a total of 5s. 5¾d., an increase on last year of ¾d., accounted for on carting.

STREET CLEANSING.

The system of collecting street sweepings by means of orderly trucks has been so successful that six additional trucks have been obtained. On the Promenade and in the main thoroughfares men are continually at work. During the past year, for instance, Bank Hey-street was swept no fewer than 4,181 times. All the principal streets are swept from ten to twelve times daily. The less important thoroughfares receive attention daily, and the back streets weekly.

The quantity of sweepings removed during the year shows a large increase, 4,969 loads having been removed by the carts, and 38,237 bins by the orderly trucks, making a total of 8,155 ordinary cart loads, this number being an increase of 485 loads on last year. The corporation carts engaged on this work were employed for 10,306 hours, and were supplemented on 2447 hours by hired carts, making a total of 12,753 hours. Last year the total was 11,814 hours. The streets swept within the borough during the year amounted to approximately 100 miles.

The expenditure in wages for carrying out the work of street sweeping for the year has been £6,777 for labour, and £713 for team labour and horse hire, a total of £7,490. This is an increase of £305 on the previous year, when £7,185 was expended. This does not include washing streets. The cost per mile has been £74 18s.

During the twelve months washing operations were carried out by the carts on 72 days. The water used amounted to 640,500 gallons, of which 15,050 were fresh water, and the remainder salt water.

In four days in January 1,209 loads of snow were taken away, at a cost of £108. The cost per load works out at 1s. 10d., or 1s. 2d: for labour and 8d. for carting.

It was necessary to grit or sand the streets on 184 days, compared with 211 the previous year.

STREET WATERING.

Mr. Bee adds: "During the past summer the utility of the new salt water main extensions was very early demonstrated, for during the prolonged drought, when we were prohibited from using fresh water, a plentiful supply of salt water was available, and this enabled us to water the streets without any restriction whatever. Moreover, this work can be done more efficiently and economically by using salt water, for after a road has been watered with it consecutively for three or four days it is practically dustless, even to the fastest motor car. Its deodorising properties are also a factor in support of its use, not only for street watering, but for flushing gullies and sewers. The salt water mains have now been extended so as to make us entirely independent of fresh water."

Street watering operations were carried out on 162 days. The quantity of water used amounted to 4,898,250 gallons, of which 3,975,300 gallons were salt and 922,950 fresh water. No fresh water was used after the beginning of June. As showing the economy of using salt water, last year the total consumption was 5,056 850 gallons. Fresh water used was 2,129,750 gallons, and salt water 2,927,100 gallons. The quantity of water used last year was the lowest on record. The cost of street watering was £714, or £7 per mile.

Town-Planning for Birmingham.—The town-planning scheme of the Birmingham City Council for Quinton, Harborne, and Edgbaston has formed the subject of a Local Government enquiry. The city surveyor, Mr. H. E. Stilgoe, gave evidence, describing the scheme in detail. He mentioned that the cost of constructing the road from Lordswood-road to Woodbourne-road would be £17,448, exclusive of owner's contributions. The total estimate for the construction of the roads, including the cost of compensation, was just over £100,000. He was perfectly certain the scheme could be carried out for the amount estimated.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Alfreton U.D.C. (August 1st. Mr. F. O. Stanford).—£1,700 for street widening purposes in the Swanwick Ward, and £700 for the purchase of land for reservoir extension in the council's watershed in the parish of Ashover.—The facts were explained by the clerk (Mr. H. R. Cleaver) and the water engineer and surveyor (Mr. R. F. Ward). In regard to the waterworks extension, a small farm, adjoining the council's Butterley reservoir in the parish of Ashover, has been purchased, and a portion of it is to be used for the enlargement of the reservoir. There is an ample supply of water, but the storage capacity of the three existing reservoirs is insufficient to meet the requirements of a growing population in a dry season.

Bexhill T.C. (July 31st. Mr. H. Shelford Bidwell).—£1,950 for groynes, and £1,190 for the construction of an apron wall.—The application was supported by the town clerk (Mr. T. E. Rodgers) and the borough surveyor (Mr. G. E. Ball). The town clerk stated that in the course of the past two years 770 yds. of sea wall had been destroyed. The beach had sunk 16 ft. at the west bastion face since December, 1909. Mr. Douglas, the engineer, recommended the construction of apron walls to commence at the west bastion and proceed in an easterly direction to such length as may be found necessary to safeguard the works. They were of opinion that several groynes should be constructed without delay. The tenders for the apron wall were as follow: Messrs. Gradwell (Barrow-in-Furness), £3,056; Messrs. Crosby & Co. (Farnham), £1,770; Mr. Carey (Bexhill), £1,603. Owing to the excess of the tenders over the estimate, and the substitution of concrete instead of sand and shingle, the figure of £1,190 was altered to £1,770, which it is estimated will cover all the expenses. The town clerk added that the council were trying something in the nature of an experiment with regard to coast defence at a cost of £160, this consisting of faggot-work, such as was done in South America. This they had charged as revenue, but if the inspector thought that it was a matter of loan the council would like to have a loan for it.

Godalming T.C. (July 31st. Mr. A. W. Brightmore).—£5,000 for repaving the main streets.—The borough surveyor, Mr. J. H. Norris, stated that the traffic through High-street during twelve hours on the previous day included 574 motor cars, 507 horsed trade vehicles, 27 motor trade vehicles, 69 motor-bicycles, and 1,663 ordinary bicycles.

St. Helens T.C. (July 12th. Mr. H. Shelford Bidwell).—£7,000 for the culverting of Windle brook, between Kirkland-street and Westfield-street, and £1,598 for works of street improvement in College-street and Tontine-street.—The town clerk said the portion of the brook at present uncovered was a nuisance. The inspector: Was there an outbreak of infectious disease last year? The town clerk answered in the affirmative, and said the outbreak was of typhoid, and in close proximity to the brook. The medical officer said that from the point of view of public health it was extremely desirable that the brook should be covered. There would be no open part near any houses, but a small portion at the back of Water-street would not be covered.

St. Ives T.C. (August 2nd. Mr. P. M. Crosthwaite).—£1,837 for a water supply scheme.—The application was to pay for works completed, and included £362 for the maintenance of a supply of water to the borough during the construction of the reservoir; £250 for additional mains which were not included in the original estimate; £154 for a meter at the Waterhouse; £45 for a meter at Albert-place tank; and £90 for three large throttle valves. The waterworks engineer, Mr. A. P. I. Cotterell, stated that the reservoir was constructed according to plans, and cost £1,300 less than he estimated. On the other hand, the attendant's cottage cost £370 which was considerably more than he estimated. The money required was for additional work that was not anticipated.

Shoreham U.D.C. (August 2nd. Mr. Edgar Dudley).—£2,200 for the purpose of purchasing the town hall, which is at present held on a yearly tenancy. It was stated that the property was freehold, and was free from restrictions. There was a wharf which would be of great importance to the council when they required to unload material for the roads, and other purposes. The vaults might be adapted as baths in the future, should the council deem it desirable to provide them.

APPLICATIONS FOR LOANS.

Chelsea B.C.—£1,300 for a storage tank for the public baths.

Cheltenham T.C.—£3,596 for paving purposes.

Colne T.C.—£950 for new road works.

Coventry T.C.—£20,000 for the extension of electricity mains.

Darlington T.C.—£3,100 for road widening purposes.

Erpingham R.D.C.—£1,410 for the provision of cottages.

Gillingham T.C.—£2,345 for works of sewerage.

Lewisham B.C.—£10,000 for a moiety of the cost of property and works in connection with the reconstruction of Catford Bridge.

Oldham T.C.—£3,000 for additional electricity mains, and £500 for services.

Stockton T.C.—£2,500 for the purchase of land for the extension of the gasworks.

Wednesbury T.C.—£3,000, further loan for the extensions to public buildings, and £105 for school lavatories.

Willenhall U.D.C.—£100 for sewer extension.

LOANS SANCTIONED.

Bournemouth T.C.—£21,424 for the erection of science, art and technical school, and £12,780 for the erection of a public elementary school at Evelyn-road, Winton, both for a term of fifty years.

Hendon U.D.C.—£2,300 for a site for a secondary school.

Maidenhead T.C.—£260 for alterations at the town hall, and £200 for public conveniences.

Salisbury T.C.—£950 for a motor fire engine.

Thetford T.C.—£6,975 for fifty workmen's dwellings.

Tring U.D.C.—£600 for street works.

Wednesbury T.C.—£6,000 for the extension of public buildings.

FORTHCOMING INQUIRIES.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Birmingham £4,477, Chelmsford, Glasgow, £60,000, St. Pancras; housing and town planning—Cardiff; roads and materials—Cardiff £36,500; sewerage and sewage disposal—Bath £21,256, Fleet £30,000, Leicester £118,916; water, gas and electricity—Merthyr £400 000.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Birmingham T.C.—Additional cottage baths are to be provided in Coventry-street at an estimated cost of £1 500, and a set of cottage baths erected in Lower Dartmouth-street at an estimated cost (including site) of £2 977.

Burgess Hill U.D.C.—The surveyor, Mr. E. Brown, has been authorised to execute the necessary works to ventilate the council chamber at a cost not exceeding £25.

Cardiff T.C.—The city engineer, Mr. W. Harpur, has prepared a sketch-plan for a cantilever bridge, 8 ft wide, which it is proposed to erect over the Taff railway at Blackweir. The estimated cost is £1,200.

Chelmsford T.C.—A public convenience is to be constructed in the cattle market. The Finance Committee have been authorised to consider a scheme for new municipal offices.

Chelsea B.C.—The council have approved a report by the borough surveyor, Mr. T. W. E. Higgens, recommending the provision of an additional storage tank at the public swimming baths of a capacity of 100,000 gallons.

Cheltenham T.C.—With respect to the competition for designs of the proposed municipal offices, it was reported at the council meeting last week that eight designs had been sent in by local architects, and that the Municipal Offices Sites Committee were evenly divided on two. As, however, no one of the designs sent in could be carried out for the sum stipulated (£11,000) they were unable to award the premium. The committee recommended that they be authorised to consult with the architects sending in the two best plans, "with a view to consider whether such modifications can be made as to meet the requirements of the council as to cost." Eventually the matter was referred back to the committee.

Glasgow T.C.—The Health Committee have resolved to establish a hospital for the treatment of consumptive patients. The initial expenditure will be £60,000.

Helston T.C.—It is proposed to erect a paper destructor in the south-west corner of Helston Downs.

Masham U.D.C.—Plans have been passed of a town hall to be erected by the trustees of the late Lord Masham, with the remainder of his bequest of £5,000 for the benefit of the town, after the provision of an isolation hospital. The new building, which is to cost about £3 000, has been designed by Mr. Houfe, architect, Harrogate.

Notts C.C.—The tender of Messrs. Ashwell & Nesbitt, at £5 489, has been accepted for the alteration of existing apparatus for the hot and cold water supply to the new county asylum blocks, the extension and improvement of the fire service, alteration of chapel heating, heating of medical superintendent's house, and additions to the kitchen and laundry apparatus.

St. Pancras B.C.—It has been decided to erect a new town hall, and to hand the existing hall over to the board of guardians.

Wandsworth B.C.—It has been agreed to co-operate with Fulham Borough Council in urging on the London County Council the necessity of building a new bridge over the Thames at Wandsworth, in place of the present insufficient structure.

Wednesbury T.C.—The tender of Messrs. Guest & Sons, of Stourbridge, at £8,500, has been accepted for the work in connection with the extension of the municipal buildings.

Wolverhampton T.C. The work-shops at the tramway car depot are to be extended at an estimated cost of £5,860.

HOUSING AND TOWN PLANNING.

Cardiff T.C.—The Housing Committee have approached the Property and Markets Committee with a request for the transfer of several parcels of land to them for the purpose of erecting thereon workmen's dwellings. Plans have meanwhile been submitted by the city engineer, Mr. W. Harpur, for some sixty-five cottages.

PARKS AND OPEN SPACES.

Cardiff T.C.—Among the works in contemplation for the unemployed during the ensuing winter is the making of a couple of bowling greens at an estimated cost of £544.

Derby T.C.—An offer of £6,800 has been made for 40 acres of land for the purpose of a recreation ground.

Eccles T.C.—It is proposed to spend £600 upon the provision of a bowling green at the recreation ground.

Margate T.C.—A sum of £13,000 has been paid for land for the purpose of an open space.

REFUSE COLLECTION AND DISPOSAL.

Stockton T.C.—It has been decided to provide two additional cells in the refuse destructor at a cost of £1,069. The borough surveyor, Mr. H. H. Sykes, explained that the destructor, which was opened in 1901, and contained only two cells, was extended four years later by the addition of two cells. The average total refuse dealt with in the first two years was 6,656½ loads per year, independent of trade refuse. For the year ending October last the quantity had increased to 9,104 loads. Since then the increase had even been more marked.

ROADS AND MATERIALS.

Aberdeen C.C. The road surveyor has received instructions to proceed with the reconstruction of that part of the Braemar-road between the 46th milestone and Balmoral-bridge.

Cardiff T.C.—The Public Works Committee recommend the relaying of some of the streets with wood blocks. Among the thoroughfares proposed to be treated are Queen-street, Bute-street, St. Mary-street, High-street, and Newport-road. The committee ask for permission to borrow £36,500 for carrying out the work.

Chelmsford T.C.—High-street is to be made up at a cost of £1,595.

Cheltenham T.C.—It has been decided to pave the whole of the promenade carriageway with sectional blocks at a cost of £3,596.

Derby T.C.—A recommendation is made by the Improvement Committee for the construction of a new street from St. Mary's-gate, at its junction with Queen-street, to King-street, at an estimated cost of £40,000.

Dulverton R.D.C.—A settlement has been come to with the contractors with respect to the Brendon-road contract, and the council have decided to take over the completion of the work (to cost about £1,700) themselves, under the supervision and management of the highway surveyor, Mr. J. Johnson.

Finchley U.D.C.—An intimation has been received that the Road Board are prepared to grant £500 towards the cost of widening the Great North-road at a point near Friern Watch, North Finchley.

Hammersmith B.C.—The tender of Messrs. Mowlem, at £6 789, has been accepted for paving the margins of the carriageways of Uxbridge-road with creosoted deal blocks.

Hove T.C.—Acting on the advice of the surveyor, Mr. H. H. Scott, the Works Committee recommend that the carriageway of Hove-villas be paved with creosoted deal blocks at an estimated cost of £1,705. The committee also recommend that the paving, kerbing and channelling on the east side of Wilbury-road shall be relaid with artificial stone slabs for a length of 250 ft. northwards from Church-road, at an estimated cost of £95. The committee further recommend that the paving on the south side of Coleridge-street be relaid with artificial stone slabs at a cost of £27. The council are advised by the

same committee to accept the tender of Messrs. McKellar & Westerman, of 136 Church-road, Hove, for carrying out the proposed new street works in Modena-road for a distance of 501 ft. northwards from Lawrence-road, for the sum of £173 10s.; also to accept the tender of Messrs. J. Parsons & Sons, of 176 Church-road, Hove, for carrying out the proposed new street works in Lyndhurst-road, from Holland-road to Silverdale-road, for the sum of £173.

Liskeard T.C.—It has been agreed to proceed with the improvement of Station-road at an estimated cost of £662, of which £477 may be obtained as a grant from the Road Board.

Loughborough T.C.—It is intended to carry out several street improvement and paving schemes.

Middlesbrough T.C.—The Middlesbrough owners at a recent meeting wrote suggesting that they should be allowed to pave Tavistock, Addison and Berner streets (off St. Barnabas-road) with vitrified bricks, on condition that they widened and paved Ormesby-road with setts for some distance. Alderman Hinton thought that bricks in a private street would last forty or fifty years and could then be turned. Alderman Mattison moved that they should not accept the offer because, he said, they had definitely decided that streets should be paved with wood, or whinstone setts. Councillor Forbes moved, and Alderman Hinton seconded, that they should accept the offer of the Middlesbrough owners. Alderman Mattison said that Alderman Hinton had once advocated the use of scoriæ bricks to the regret of the corporation. Alderman Hinton contended that there was no comparison, and the borough engineer (Mr. S. E. Burgess) remarked that in many residential streets to-day scoriæ bricks would be suitable and better than macadam when there was little heavy traffic. Alderman Mattison's resolution was carried.

Middlesex C.C.—It has been agreed to contribute half the cost of widening the Kingston main road at its junction with Manor-road, Teddington, which was estimated by the district council to entail a total outlay of £210. It has been further agreed to accede to the application of the Teddington District Council to bear half the cost of an improvement in the High-street of that town, between Waldegrave-road and Wade's-lane and between Wade's-lane and Cambridge-road. The total expenditure on the work was estimated by the district council at £326. The council have reconsidered the application of the Hampton District Council with respect to the widening of the main road along the frontage of Ferry House, and have informed them that if the property could be acquired for £825 plus £35 costs, the county council would contribute half the cost, subject to the part not required for the widening being dedicated as an open space. It has been further agreed to contribute one-third of the cost of rounding off the corner at the junction of the Upper Sunbury and Percy-roads, Hampton, the contribution not to exceed £32.

North Riding C.C.—The council have accepted a grant from the Road Board of £112 towards the tar spraying in various district roads in the Riding, and part of the work has already been done. They have also accepted from the Road Board a grant of £1,877 towards the cost, estimated at £2,503, of the tar grouting of new beds of macadam on certain of the main roads of the Riding, and part of the work has been proceeded with whilst the weather was favourable.

Notts C.C.—Some difficulty has arisen in Notts owing to the fact that locomotives exceeding 14 tons in weight, licensed in another county, have been brought into Nottinghamshire on payment of a daily travelling fee without the authority of the council being first obtained. The council have decided that authority for such locomotives to enter the county should not be granted except on special conditions drafted by the committee, amongst which were: That the locomotive should only be used for the purpose of drawing a single indivisible article, which could not be drawn by a locomotive weighing less than 14 tons, and that the owner would refrain from using the locomotive on any road the condition of which was unfit for such heavy traffic.

Tring U.D.C.—The surveyor, Mr. S. Gettings, has presented plans, specifications, estimates and provisional apportionments for the making-up of Longfield-road, and the sewering of Beaconsfield-road under the Private Street Works Act, 1892, the estimate for the former being £2,357, and for the latter £122. These plans have been approved, and the council have resolved to apply to the Local Government Board for a loan to cover the cost.

Westhampnett (Sussex) R.D.C.—The tender of Mr. John Sparks, of Yapton, has been accepted for steam rolling at 22s. per day.

Woolwich B.C.—The footway on the south side of Eton-road between Burrage-road and Armstrong-street is to be relaid with slab paving at an estimated cost of £72.—The London County Council have notified the borough council of their decision to undertake the widening of Church-street and High-street, Woolwich, at an estimated nett cost of £69,000, towards which the council had already agreed to contribute a sum not exceeding £23,000, and to include in the scheme the widening opposite Nos. 19 and 20 High-street, as to which favourable terms have been agreed.

SEWERAGE AND SEWAGE DISPOSAL.

Bath T.C.—The tender of Messrs. Firth & Co., at £21,256, has been accepted for the construction of a sewage disposal scheme for Twerton and Weston.

Chipping Norton R.D.C.—Mr. Stallard has been appointed engineer to prepare a scheme of drainage and sewage disposal for Salford. The local landowners have all refused to sell land for the purposes of a scheme, and it may become necessary to put the Compulsory Land Clauses Act into force.

Fleet (Hants) U.D.C.—The council have adopted the scheme prepared by Mr. T. J. Moss-Flower, 28 Victoria-street, Westminster, and Bristol, for the main sewerage of the district. It was also decided that Mr. Moss-Flower should act as engineer for the scheme. The work involves upwards of 16 miles of sewers, lifting plant, sewage disposal works, &c., and the estimated cost is £30,000. The scheme adopted was submitted in a limited competition, and the adjudicator, Mr. H. Percy Boulnois, M.INST.C.E. in his report to the council, said "it was the best and most practicable scheme for sewering the somewhat difficult district of Fleet," and that he "unhesitatingly recommended its adoption."

Leicester T.C.—A scheme has been prepared by the Joint Committee on sewage disposal for dealing with the large volume of water entering the sewage sluice in times of heavy rainfall, in order to secure the purity of the discharge into the river Soar. The estimated cost is £118,916. Consideration of the matter has been postponed to the next council meeting.

Tring U.D.C.—The surveyor, Mr. S. Gettings, has presented plans, &c., for extension of surface-water sewers in Miswell-lane and Aylesbury-road, the estimated cost being £200, and for house connections in Longfield-road, the estimated cost being £100. The council have decided to apply to the Local Government Board for a loan to cover the cost of these works.

WATER, GAS, AND ELECTRICITY.

Ashwell R.D.C.—The tender of Messrs. J. T. Bailey & Co., Limited of Ashwell, at £2,300, has been accepted for the execution of a water supply scheme.

Atherton U.D.C.—A sum of £2,000 is to be laid out on new gas and water mains.

Darlington T.C.—The yearly accounts of the gas-works show an increase in all departments. There was an increase of £2,107 in the nett profit. The waterworks have made a nett profit of £8,444, of which £7,000 has been promised in relief of the rates.

Dewsbury T.C.—The plant at the electricity works is to be extended at a cost of £5,400.

East Cowes U.D.C.—The surveyor, Mr. A. E. Barton, reports the completion of the new reservoir. The job, he states, is a very satisfactory one.

Haddingtonshire C.C.—It has been agreed by the Eastern District Committee to form Innerwick into a special water district, and an estimate has been submitted for the introduction of a supply of water for the district.

Holborn B.C.—A new scheme of lighting which was agreed to some time ago by the council is now being carried ont in New Oxford-street and High Holborn. The new lamps are of 80-candle power, and are of the Keith pattern. They are mounted on 18-ft. standards with inverted mantles and high-pressure gas. A scheme of electric light is also in use, and the council claim that when completed these thoroughfares will be the best lighted in London.

Islington B.C.—A sum of £1,000 is to be allocated to the rates from the surplus profits of the electricity undertaking.

Lampeter T.C.—An experiment is to be made with the electric light for a period of three months.

Lostwithiel T.C.—A new reservoir which has been erected in St. George's Park was inaugurated last week. It is of 80,000 gallons capacity, and has been built by Mr. W. E. Bennett, of Bodmin, at a cost of just over £800. Messrs. Jenkins, of Liskeard, were the engineers, and the work has been satisfactorily carried out in every respect.

Merthyr T.C.—Preparations are being made for the construction of the new reservoirs at Taf Fechan, which are estimated to cost £400,000.

North Walsham U.D.C.—The tender of the North Walsham Gas Company has been accepted for lighting the town on the same terms as last year—*viz.*, single burners, £2 4s.; double burners, £3 17s. 6d; extra time, 3s. 9d. per hour; town pump, £10 6s.

Torquay T.C.—To meet the increasing demand for electricity, a 1,000-k.w. turbo-alternator is to be installed at a cost of £6,500.

Walton-upon-Thames U.D.C.—The Walton and Weybridge Gas Company's tender for street lighting at £2 16s. per lamp has been accepted for the ensuing three years.

Westbury (Wilts) R.D.C.—The surveyor, Mr. W. H. Stanley, reports the completion of the Steeple Ashton waterworks, and the council have required all houses to be connected with the supply within a reasonable time.

MISCELLANEOUS.

Coventry T.C.—It is proposed to apply to the Board of Trade for sanction to spend £20,475 upon the purchase of tramway cars, the extension of the carshed, and the provision of passing places.

Glasgow T.C.—Delegates have been nominated to attend the annual congress of the Sanitary Association of Scotland, to be held at Montrose from September 18th to 21st.

Stockton T.C.—A new motor Daimler fire engine is to be purchased for £996.

INDIAN STUDENTS AND MUNICIPAL ENGINEERING.

Mr. Thomas Cole, secretary of the Institution of Municipal and County Engineers, has issued to the members of that body a circular in which he states that he very frequently receives applications from Indian students requiring attachment to municipal engineers for the purpose of gaining practical knowledge in municipal engineering generally, with the special purpose of passing the examination of this institution. They are usually prepared to pay a premium of from £50 to £100 for their Articles. Mr. Cole points out that the subjects of the institution's examination are as follows:—

(1) Engineering as applied to Municipal Work: 1st Paper—(*a*) Sewage Disposal; (*b*) Tramways Construction; (*c*) Bridge Construction; (*d*) Water Supply.

(2) Engineering as applied to Municipal Work: 2nd Paper (*a*) Geodesy; (*b*) Hydraulics; (*c*) Sewerage; (*d*) Road Construction and Maintenance.

(3) Building Construction: Strength of Materials—(*a*) Materials; (*b*) The Construction of Public and Private Buildings; (*c*) Building By-laws; (*d*) Public Baths and Hospitals.

(4) Sanitary Science as applied to Towns and Buildings: (*a*) Heating and Ventilation; (*b*) Scavenging and Disposal of Refuse; (*c*) Water Supply and Drainage of Buildings; (*d*) Disinfection.

(5) Municipal and Local Government Law as relating to the Work of Municipal Engineers and Surveyors, and the students would therefore desire to serve their Articles in an Office where they would receive practical experience in these subjects. In the majority of cases their theoretical education is high.

Those members of the institution who have works in construction, and who are desirous of taking a pupil, are invited to communicate with Mr. Cole on a form which is attached to the circular, and on which particulars of the premium required, the period of Articles, and the nature of the works in hand are required to be given.

PERSONAL.

Mr. C. Vernon Bright, surveyor of highways to the Braintree Rural District Council, has had his salary increased by £25 per annum.

Mr. F. C. Harvey, F.A.S.I., assistant surveyor to the Gosport and Alverstoke Urban District Council, has been elected a member of the Institution of Municipal and County Engineers.

Mr. Reginald Brown, of 21 Old Queen Street, Westminster, has been called in by the Uppingham (Rutland) Rural District Council to advise them on the question of sewage and sewage disposal.

Mr. A. W. Moore, for seventeen years road foreman to the Teddington Urban District Council, died on Sunday morning last after a short illness. He was highly esteemed by the men under his control, by whom his decease is much regretted.

Mr. J. Garfield, sewage engineer to the Bradford Corporation, has, at the request of the London County Council, been granted leave of absence to inspect the metropolitan sewage works, and advise the London County Council in regard to the disposal of sewage sludge.

Mr. Herbert Holloway, of Wolverhampton, whose death at the age of sixty was recently recorded, has left estate of the gross value of £101,103. As a public-works contractor he was responsible for the construction of the Wolverhampton Corporation Tramways and several large water and sewerage schemes.

Mr. J. S. Walker has been promoted to the position of deputy borough engineer and surveyor of Wallasey, rendered vacant by the death of Mr. B. Howdle, Assoc. M.Inst.C.E. For the past thirteen years Mr. Walker has been with the corporation of Wallasey, and previous to that he was in the borough engineers' offices of Bury and Aberdeen. The salary attached to the office is £260, rising to £350.

Mr. John Wilson, city engineer of Fort William, Ontario, is a native of Lanarkshire, and is thirty-two years of age. He was educated at Glasgow, and the West of Scotland Technical College, and was apprenticed to Messrs. Wm. Robertson & Son, Glasgow, civil and mining engineers, from 1897 to 1904, during the latter period of which time he was resident engineer at the lead mine of Strontian, Argyleshire. He went to Canada in his early twenties, and in 1906 was made assistant to city engineer Hancock, of Fort William. He succeeded to his present position in January of this year.

Mr. A. Rothera, engineer and surveyor to the Liversedge Urban District Council, has received a grant of £50 for the extra services rendered by him in designing the extensions to the council's sewage works. The council have also intimated that as the extensions progress the question of further grants will be considered. Mr. Walter Senior, now assistant surveyor to the Rothwell Urban District Council, has been appointed temporary assistant to Mr. Rothera during the time of the preparation of the working drawings, quantities, &c., for the sewage works extensions, at a salary of £100 per annum.

Mr. Frank G. Howell, who for fifteen years held the position of county surveyor of Surrey, passed away recently, we deeply regret to report, at Milford, near Christchurch. Mr. Howell was born in 1855, and was the son of Mr. Charles H. Howell, who was for a very long period also county surveyor, and designed and superintended the erection of the county hall at Kingston. Before receiving the appointment of county surveyor Mr. Frank Howell was for seven years associated with the work under his father. On his retirement in 1908 warm tributes were paid to him by various members of the Council, stress being laid upon the excellence of his work and upon the harmonious relations he succeeded in establishing between the local authorities and the county council. The esteem in which he was held by the magistrates and county councillors was shown by the very handsome parting cheque which he received, with which Mr. Howell built an observatory thoroughly equipped for astronomical work, which was his hobby. In February, 1909, it may be recalled, a complimentary banquet was given in Mr. Howell's honour at the Municipal and County Club by the highway surveyors of the

county of Surrey, who presented to him, in the course of the evening, a magnificent album containing about forty pages of original pen-and-ink drawings by Mr. Cottington Taylor, each page representing a district of the county. Sympathetic reference to Mr. Howell's death was made at the last meeting of the Surrey County Council by the chairman (Alderman A. W. Chapman) and Alderman Pain (chairman of the Highway Committee).

The Council of the Institution of Civil Engineers have resolved to propose at the next meeting the election of Mr. Thomas Coltrin Keefer, C.M.G., of Ottawa, Canada, as an Honorary Member of the Institution, because of the distinguished part he has taken in the engineering enterprises which have aided so largely the development and prosperity of the Dominion; and on account of the services which he has rendered to civil engineering during his long association with it since his entry into the profession in the year 1838.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ASSISTANT SURVEYOR in Public Department, North of England. Salary £75 per annum. Only quick and energetic men need apply.—Box 1,178, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

TREDEGAR URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The above Council invite Tenders for the Construction of Subsidiary Sewers in their District, comprising about 23½ miles of 6-in., 9-in., 12-in., 15-in. and 18-in. Pipe Sewers, together with about 800 Manholes, &c.

The work is divided into three separate Contracts:

No. 1, comprising the Northern portion of the District.
No. 2, comprising the Central portion of the District.
No. 3, comprising the Lower portion of the District.

Preference will be given to the Contractor tendering for the whole.

The Council do not bind themselves to accept the lowest or any Tender.

Plans may be inspected at the Office of the Engineer to the Council, Mr. Wm. Lloyd Roach, Bedwellty House, Tredegar, any day during office hours.

Copies of the Specification, Schedule of Prices and Bills of Quantities can be obtained from the undersigned on making a deposit of Five Guineas, which will be returned after the receipt of a *bonâ-fide* Tender properly priced and filled in.

Tenders to be delivered not later than noon on Monday, the 9th day of September, 1912, endorsed "Tender for Sewerage."

H. J. C. SHEPARD,
Clerk to the Council.

Tredegar.
August 7, 1912.

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

ST. STEPHEN'S BRIDGE, COGGESHALL.

Tenders are invited from Contractors for the execution of the necessary works involved in Widening the existing three-arch Brick Structure known as St. Stephen's Bridge, which spans the river Blackwater at Coggeshall. The widening is to be executed in brickwork.

Drawings may be seen, and Bills of Quantities obtained, at the County Surveyor's Office on and after Monday, the 12th inst.

Sealed Tenders are to be delivered not later than the first post on Wednesday, the 28th inst.

The lowest or any Tender not necessarily accepted.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

County Surveyor's Office,
Chelmsford.

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

WIDENING OF THE SPRINGFIELD BRIDGE, CHELMSFORD.

Tenders are invited for the execution of the necessary works involved in Widening the Springfield Bridge at Chelmsford.

Drawings may be seen, and Bills of Quantities obtained, on and after Monday, the 12th inst., at the County Surveyor's Office, Chelmsford.

Sealed Tenders, addressed to the undersigned, and endorsed "Springfield Bridge," are to be delivered not later than the first post on Wednesday, the 28th inst.

The lowest or any Tender not necessarily accepted.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

County Surveyor's Office,
Chelmsford.

August 7, 1912.

MADRAS CORPORATION, INDIA.

WANTED: ASSISTANT WATERWORKS ENGINEER.

The President, Corporation of Madras, invites applications for the Appointment of a Waterworks Assistant to the Special Engineer (J. W. Madeley, Esq., M.A., M.INST.C.E., M.AM.SOC.C.E., &c.).

The duties will be to assist the Special Engineer in the design, construction and maintenance of works connected with the Water Supply Distribution System of the City of Madras, especially cast-iron main laying and the installation and working of waste-water meters.

The salary will be Rs.400 (£26 13s. 4d.) per mensem. An allowance of Rs.30 (£2) per mensem will be paid to the Officer appointed so long as he maintains and uses on the work a first-class motor bicycle in good running order. No other allowance of any kind will be made.

Before sailing for Madras, the successful candidate will be required to sign a three years' agreement to be prepared by the Corporation. By mutual consent the appointment may be extended for a further period.

The Corporation reserves the right to determine the appointment at any time by three months' notice in writing or by payment of one month's salary.

The Officer appointed will be allowed ordinary first-class railway fares and second-class steamship passage to Madras, *viâ* Marseilles and Bombay, by P. and O. steamer. A like class return free passage will be granted on the termination of the appointment, subject to satisfactory service according to the conditions of the agreement. Half-pay will be granted on the voyage out from the date of leaving England.

Leave will be granted on full pay to the extent of one month for every eleven months of active service, but for not more than three months at a time.

Preference will be given to candidates who have had experience in the design and maintenance of water-pipe distribution systems, including detection and prevention of waste by waste-water prevention meters, stethoscopes and other means.

Applicants must not be more than 35 years old, and copies of certificates of age, testimonials and medical certificate of fitness for service in India must be enclosed with the applications, which must reach the undersigned *not later than* 31st August, 1912.

The applications will be sent out to Madras, where the selection will be made by the President of the Corporation.

The President reserves the right of rejecting all applications without giving reasons.

The Officer appointed will be required to commence his duties in Madras not later than eight weeks after he has received notification of the acceptance of his application.

Applications must be in writing, and should be sent to the undersigned in envelopes superscribed "Waterworks Assistant."

JAMES MANSERGH & SONS.
Agents to the Corporation of Madras.

ASSOCIATION OF CONSULTING ENGINEERS.

FIRST MEETING OF DULY ELECTED MEMBERS.

The first meeting of duly elected members of the Association of Consulting Engineers was held at the Institution of Electrical Engineers on Monday, July 22nd, Mr. G. Midgley Taylor, M.INST.C.E., presiding.

The hon. secretary read the list of members to date, eighty in all, explaining that some had only joined conditionally on their being satisfied with the rules in their final form.

The CHAIRMAN then said the business of the present meeting was to receive the rules presented at the meeting held in January and the report and proposals of the Provisional Committee, and to elect the first committee of the association. In making the following remarks he wanted members to understand that he was not speaking for himself alone, but from a document prepared by the committee and with which the committee were in absolute and full accord. They were only following the lead of the United States and Germany in the formation of an Association of Consulting Engineers to look after their own interests. If they could not look after their own interests better than anybody else he would be surprised. In the formation of an association of this nature it was only natural that certain questions should arise, and one of the most important that had arisen was, What is a consulting engineer? The committee had devoted considerable attention to the matter, and had, after consultation with their legal advisers, adopted the following definition:—

"A consulting engineer is a person possessing the necessary qualifications to practise in one or more of the various branches of engineering who devotes himself to advising the public on engineering matters or to the designing and supervising the construction of engineering works, and for such purpose occupies his own office and employs his own staff, and is not directly or indirectly concerned or interested in commercial or manufacturing interests such as would tend to influence his exercise of independent professional judgment in the matters upon which he advises."

The next question which had been asked was, Why was it necessary to form a new association when there were such ancient and honourable institutions as the Institutions of Civil, Electrical and Mechanical Engineers? All the members present were connected with one or other of those honourable bodies, and they would remain loyal to them; but it was felt there was a necessity for the formation of a society specially devoted to the small proportion of consulting engineers who belonged to the vast numbers of those various institutions. The committee thought that probably not 5 per cent of the members of the three important institutions in question complied with the definition of a consulting engineer that the committee had already laid down, and that there had up till now been no source from which any one could obtain definite information as to who was an independent consulting engineer and who was not. The association, subject to the rules being amended, would be composed of those members of the three institutions on whom the rules of professional conduct drawn up by the Institution of Civil Engineers, and since accepted by the Institution of Electrical Engineers, were always binding, as distinguished from those members who were only bound by them when acting in a consultative capacity. The association did not suggest that any duly qualified engineer should not be consulted on any engineering matter on which he was an expert; but they did say that it should be possible to distinguish the independent consulting engineer from the expert who might be closely identified with manufacturing or contracting interests. The objects of the association were set out in the Articles of Association, and they were, briefly, to uphold the standard of professional conduct and to promote the professional interests, rights, powers and privileges of consulting engineers. Those objects were equally in the interests of the public and of consulting engineers, and could obviously best be promoted by the creation of such an association as this. Since the meeting in January last the committee had again reviewed the rules which had now been put into legal form. The Articles of Association and the rules, as proposed by the committee, were in the members' hands, including the alterations of the original rules, which the committee now asked the members to approve, and which were as follows:—

(1) That the subscription be raised from 1 guinea to 2 guineas.

(2) Corporate membership of the Institution of Civil Engineers or full membership of the Institutions of Electrical or Mechanical Engineers be accepted as evidence of technical qualifications for membership of the association.

(3) That members be entitled and requested to use the abbreviation M.Cons.E. when stating their qualifications.

(4) That the committee be increased to 18, of whom not more than 12 shall be London members.

The treasurer would tell the members that the association could not make both ends meet and become useful—by circularising members in regard to things current and probably by having some quarterly communications—if the subscription were only 1 guinea a year. With regard to the alteration of the rule which provided that corporate members of the Institution of Civil Engineers only should be admitted, the committee, after mature deliberation, thought they should throw their ranks open not only to corporate members of the Institution of Civil Engineers but also to full members, both the Electrical and Mechanical Institutions. The president-elect of the Electrical Institution, one of the most eminent men in his profession, was not a member of the Institution of Civil Engineers, and therefore, although anxious to join, would have been ineligible under the rule in its original form. After the rules had been finally approved by the meeting, the earliest opportunity would be taken to submit the Memorandum and Articles of Association for the approval of the Board of Trade and to register the Association, after which the final rules and list of members would be printed and circulated among the members, and Government departments and engineering and public bodies will be notified of the formation of the association. It was felt that the association, as the only body representing consulting engineers, would form a useful channel through which the opinions of consulting engineers could be ascertained and with whom bodies representing other engineering interests could usefully confer. It was hoped that all members would assist the association by reporting for the consideration of the committee any matter affecting consulting engineers which, in their opinion, could be usefully dealt with, and also by inducing all eligible consulting engineers who had not yet done so to join the association. He formally moved that the Memorandum and Articles of Association, including the alterations and additions which had been referred to, should be approved and adopted. In the document in the members' hands the proposed rules were included, and in addition to the specific alterations he had mentioned there were a number of new rules and a number of slight verbal alterations which had been put in by the honorary solicitor, on the advice of counsel, but they were merely formal.

The HONORARY TREASURER (Mr. S. R. Lowcock) said he did not think it was likely that the association could ever become a very large body, as the number of engineers who were eligible under these rules was, as the chairman had already pointed out, limited. With a comparatively small membership, and an annual subscription of only 1 guinea, the association would be always in difficulties, and could not be effective in the way he was sure they all desired and intended. Although it was not an association for profit, to enable it to be carried on properly they must not only make both ends meet, but must have a small margin. In addition to the annual expenses, the preliminary expenses, registration, printing the Memorandum and Articles of Association, and list of members had to be provided for, and from the estimates he had made he was quite sure it was not possible to conduct the business of the association properly with an annual subscription of less than 2 guineas.

Mr. CHARLES BRIGHT congratulated the committee on the care with which they had considered the whole subject, but he thought a subscription of a guinea should be sufficient for an association of that kind. He did not wish his remarks taken in any spirit of animosity.

Mr. W. FAIRLEY said he had rather expected the subscription would be raised above 2 guineas, because there must be an ordinary paid secretary in addition to the honorary secretary.

The CHAIRMAN said he trusted the meeting would approve of the proposal to increase the subscription. If they got a large membership they could, if thought advisable, reduce the subscription back to a guinea.

The meeting then approved the alterations and the

addition (with regard to the use of the abbreviation "M.Cons.E.") set out above.

The Chairman then moved, and Mr. W. R. Cooper seconded, a resolution that the Memorandum and Articles of Association, and the rules as amended and as printed in the document before the meeting be received and adopted.

Before putting the resolution to the meeting, the Chairman invited discussion on any points members might raise. After replying to questions by Mr. M. G. Weekes and Mr. J. H. Blizzard, the chairman put the motion, which was duly carried.

With regard to the constitution of the committee, the Chairman remarked that the committee were anxious to have a certain continuity of action for the first year, and they issued among themselves balloting papers for the London members, with the result that the twelve names printed in the Articles of Association received the majority of the votes. The hon. secretary and hon. treasurer were also (*ex-officio*) members of the committee. In accordance with the rules, one-third of the committee retired every year. The committee were not empowered to recommend names for filling up the four vacancies so created, and those who retired were not eligible, under the rules, for re-election, but it was open for any member of the association to propose a member of the committee, and they would be balloted for at the general meeting. With regard to the country members, the selection was one that required careful consideration, and the committee asked that, in the first instance, the election should be made by the twelve London members, whose election he invited some member to move. The suggested committee included representatives of civil, electrical and mechanical engineering.

Mr. J. H. Blizzard proposed that the members suggested by the committee (Messrs. John Sydney Alford, H. Percy Boulnois, William Tregarthen Douglass, Baldwin Latham, Ernest Lawson Mansergh, William Morris Mordey, William Henry Patchell, Henry Rofe, John F. C. Snell, Edmund Herbert Stevenson, James Swinburne and G. Midgley Taylor) be the London members of the committee for this year.

Mr. A. A. Campbell Swinton seconded, and the motion was duly carried.

The Chairman then proposed that the list of country members of the committee be left vacant for the present, on the understanding that the committee would fill the list up with the best names they could find for the provincial towns, but he invited suggestions from members. The committee felt that upon the country members would largely depend the amount of support the association would receive from the various provinces they represented.

Mr. Weekes seconded, and the motion was duly carried.

Votes of thanks to the Institution of Electrical Engineers (for the use of their rooms), to the hon. secretary (Mr. A. H. Dykes), to the hon. solicitor (Mr. F. W. Wright), and to the chairman (Mr. G. Midgley Taylor) closed the proceedings.

Problems in Engineering.*—This reprint from the popular students' section of our contemporary consists chiefly of questions that have been set at the examinations of the Institution of Civil Engineers and of the Institution of Municipal and County Engineers. There is no index to the work, but the matter is classified under the heads of Mechanics and Hydrostatics, Strength and Elasticity of Materials, Theory of Structures, Surveying and Levelling, Water Supply and Hydraulics, Sewerage, Sewage Disposal, Road Making and Tramways, Building Construction and Materials, Law, and Miscellaneous. This book is calculated to be of considerable use to students in these subjects, but it would have been an advantage if the source of the questions could have been stated. The answers have in general been given rather more fully than would be the case at an examination, with the object of explaining the principles to a student without his having to refer to a text-book for them. The price brings the work within the reach of all students, and there is so much useful matter compressed into a small space that even the best-prepared candidate cannot afford to be without it. *Sanitary Record.*

MUNICIPAL WORK IN BRISTOL.

CITY ENGINEER'S REPORT.

Some of the most important works carried out during the past year by the Bristol city engineer's department have been designed to prevent the periodic floodings that have occurred in the district of St. George, both before and since the inclusion of that area within the city boundaries. Due, in some parts, to the areas being so depressed that the storm waters could not easily discharge into the main sewers, and to the fact that since the system of the main sewers in St. George was carried out, nearly forty years ago, a very considerable portion of the district has been built over, with the result that a large increase of impermeable area has taken place, the rainfall from the hilly portions now finds its way very rapidly to the lower portions, causing a congested condition of the sewers and a consequent flooding of low-lying parts. This was the case at Chaplin-road, where the evil has been met by the construction of a storage tank under the street which retains the storm waters until such time as the main sewer is relieved, or, alternately, by discharging the surplus through a storm overflow into the river Frome. The flooding at Lypiatt-road was caused by a too great concentration of sewers at one point, and this has been met by diversion.

At Redland the sewage from the upper part of Cotham had to pass through a culvert constructed under the Clifton Extension Railway, which, although sufficient for the needs of the district when first made, became inadequate from the extension of roads and buildings. This culvert has been reconstructed of an increased size.

At Baptist Mills the flooded area had been very much reduced by preventive works in the past, and it is hoped that those completed by the department during the year under consideration will prevent a recurrence of any further trouble.

It must be remembered that, physically, the city of Bristol is built in a basin surrounded by hills, down which the storm waters pour rapidly on their way to the river Avon, which is their only outlet; and, if a combination of a very high tide and a severe storm occurs, temporary inconvenience must arise in some of the lowest parts of the city where basements have been constructed below tide level.

The number of houses built during the year shows a further decline, only amounting to 204, but there were 150 fewer empty houses than last year.

The surface treatment of macadam roads with tar was again carried on extensively in the early part of last summer, and satisfaction is expressed in the annual report of the city engineer—from which these particulars are extracted—that, in spite of the great change in modern appliances for locomotion, the total cost of maintaining the macadam roads shows very little increase over the cost five years ago, while the number of loads of sweepings and slop removed was over 20,000 less than the yearly average prior to this treatment being introduced.

The report, which bears the signatures of Mr. Lessel S. McKenzie, Assoc.M.Inst.C.E., the newly appointed city engineer, and Mr. T. H. Yabbicom, the consulting engineer to the corporation, states that the total area of the city is 17,004 acres, and its population 359,400. The total length of highways is 354 miles, and that of sewers 358 miles. Highways of a length of 26½ miles are lighted by 695 electric arc and 25 incandescent electric lamps, and there are 9,288 gas lamps, 178 oil lamps, and 5 acetylene lamps. Twenty-one bridges are maintained by the general district rate. The length of highways added to the city during the period covered by the report is 1½ miles.

"Velography."—In a booklet which has just been issued by Messrs. Norton & Gregory, Limited, of Castle-lane, Buckingham-gate, London, S.W., there is given an interesting description of that firm's well-known method of plan reproduction, "Velography," pointing out the many different uses to which the process can be put. The great increase of their business has again compelled the company to extend their premises, and their plant has been increased by the addition of the most up-to-date machinery they have been able to devise. "Velography" copies are claimed to be equal in every respect to original drawings, the finest details being perfectly reproduced in a deep and absolutely permanent black. An important point is that they are true to scale, being unattached by liquid from start to finish.

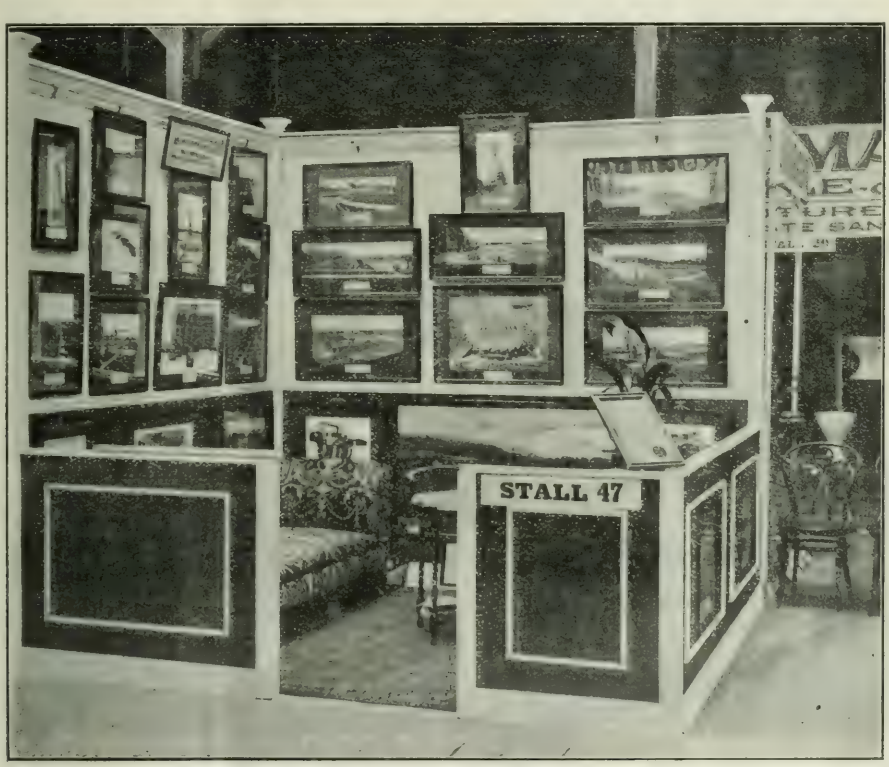
SEWERAGE AND SEWAGE DISPOSAL APPARATUS.

ADAMS-HYDRAULICS' EXHIBITS AT YORK.

We referred in our last issue to Messrs. Adams-Hydraulics' Stall, No. 47, at the York Exhibition of the Royal Sanitary Institute. In view of the fact that the firm have their large and handsome showrooms at their works fitted up with every type of apparatus in work, they considered it sufficient to show a series of photographs descriptive of a few of the more than 5,000 installations which they have fitted up in connection with works of sewage disposal, sewage lifting, and so forth. These photographs, numbering about forty, were shown on the walls of a tastefully fitted up lounge. They were all in sepia, richly mounted and framed, the pictures varying in size from 18 in. by 18 in. to 4 ft. 6 in. by 3 ft. One of the latter size is specially noteworthy as showing the bacterial filters at Horsforth, where three of Messrs. Adams' latest distributors (the "Adamic") have recently been fitted in place of those of another maker.

in which the extreme appreciation of the working of these lifts is expressed. This plant has effected a saving to the corporation of some £700 or £800 a year.

Interesting views were shown of Messrs. Adams' automatic apparatus for operating bacteria beds, where the airlock feed supplies each bed, and the timed withdrawing syphon discharges the contents of each in rotation and automatically. Probably the most imposing of these photographs was that descriptive of the Chiswick works. A picture of considerable interest was Mr. Dibdin's first bacteria bed at Barking, which was followed by the bacteria beds at Sutton, where, for the first time, automatic syphonic apparatus (made by Messrs. Adams) was used, when in the early years of bacterial purification the latter place became the Mecca of all sanitarians. It is interesting to remember that, while the pendulum has swung so far in the direction of percolating beds, contact beds are still being constructed, and that the effluent from many beds which have been in constant operation for the last ten years is as perfect and as pure as the effluent from any percolating bed to-day.



View of Lounge, Adams-Hydraulics' Exhibit, York.

Another specially interesting picture was that of the Exminster sewage lift, where the tower which supports the flushing tank is formed of the pipes of which the apparatus is composed, one limb of the tower serving as the supply main, from which the sewage is delivered to the flushing tank. Another limb serves for the discharge main from the flushing tank to the air cylinder.

A view which received considerable attention was the Douglas enlargement showing the magnificent bay with its hundreds of hotels and important boarding-houses, with the town rising up behind. The whole of the sewage from this area is raised by means of the sewage from the higher grounds by Messrs. Adams' patent automatic sewage lifts. This important installation was commenced some nine years ago after considerable discussion as to the wisdom of adopting the Adams' patent automatic lifts in lieu of non-automatic compressed air ejectors. The former were decided upon, and now, at the expiration of nine years, the Corporation of Douglas have presented Messrs. Adams with a testimonial under their seal,

A fine enlargement of a photograph of Messrs. Adams' patent conical manhole cover showed to advantage the continuous curved side which has been so valuable a feature in making this cover unique; the firm claim that it was the first cover made having a curved exterior, and that it still remains the only cover of this complete form. One very noticeable point in connection with this exhibit is the fact that Messrs. Adams-Hydraulics were the pioneers in the use and the original inventors of most of the apparatus shown.

Among the many visits arranged for the delegates at the congress was one to Messrs. Adams' showrooms and works. In their showroom various apparatus and plant were to be seen in operation, as, for instance, automatic sewer flushing syphons, alternating syphons, low-draught dosing syphons, automatic sewage lifts, and timed discharge syphons, and so on; in fitted ironwork, large penstocks with the Hingston two-speed gear, Adams' patent conical penstocks, Templeman's safety standpost, floating arms for storm water, decanting valves, and many other

fittings used in connection with water and sewerage work. Various sizes of Adams' well-known patent conical cover were also shown, demonstrating the extreme value of the continuous unbroken curve, which takes the place of the ordinary vertical side, making it, in the view of the firm, the only really safety cover manufactured. It is worthy of note that since the introduction of this cover by Messrs. Adams (prior to which all covers had vertical sides) an enormous number has been sold, and that this cover is now practically the type adopted by all engineers. Hundreds of testimonials have been received by the firm in which the high appreciation of the patent "Conical" is expressed.

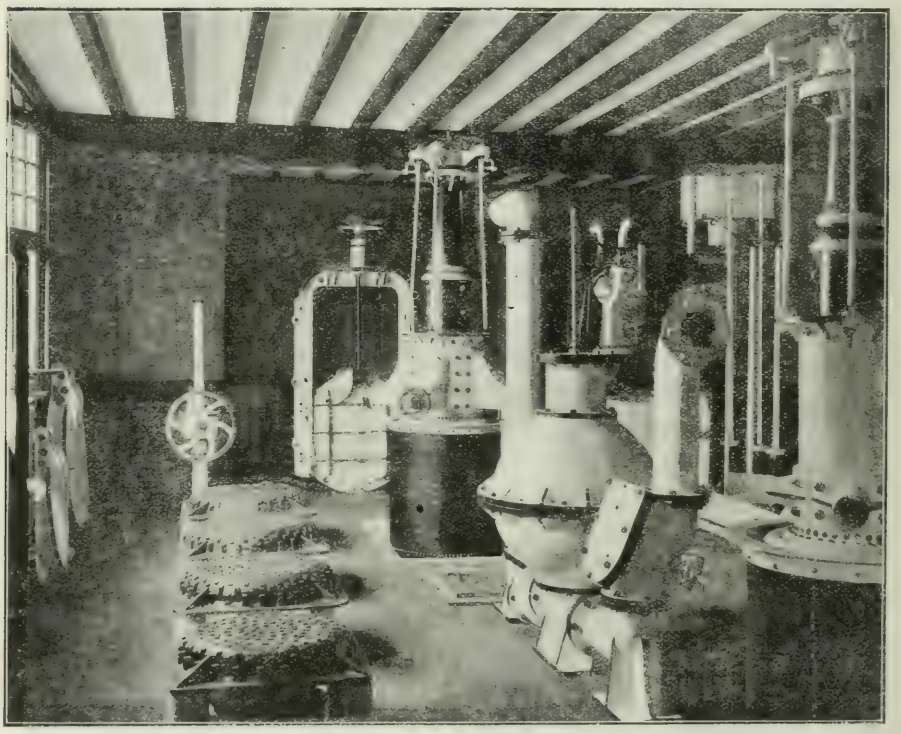
The immense improvement recently effected by Messrs. Adams in distributors, by the introduction of their new "Adamic," was well seen by comparing a large example of the latter with one of the former "Cresset" type, which, with all its advantages, has now been surpassed by the new "Adamic." This distributor has been made to overcome a difficulty inherent in every type of revolving distributor. The difficulty has been in the past to construct a distributor which would deliver a large variation in volume under a minimum head. It has been necessary formerly in such a case to use certain standby overflow arms, delivering the minimum discharge through two or more arms at a lower level and the maximum over the standby or overflow arms. This has meant that only one half of the arms have been available for driving power under the smaller head, when the greatest force was really necessary, with the result that in windy weather, or in exposed positions, it was impossible for a distributor to revolve with any certainty under the minimum. In the new "Adamic" distributor all the arms are used for the minimum delivery as well as for the maximum (a special connection between the arms and the revolving body making this possible), and, further, it is possible to deliver a volume which may vary as much as from 1 to 6 under a head of 18 in. This distributor will work with ease under a head of 6 in. The value of great variation in volume will be well understood by those who, having constructed filters and distributors which were capable of dealing with the flow, have found that as the flow increased, while the filters themselves were capable of producing an effluent with a larger volume, it has been impossible to get this larger volume on to the filters under the available head because of the limitation of the distributor itself, which, owing to its construction, could not deliver any greater volume than that which it actually passed at the time—*i.e.*, say, three volumes—the result being that new filters have had to be constructed. The "Adamic," as has been already said, will under the same head deliver a volume up to six times, if necessary, and thus would save the construction of the additional filters, to which we have referred.

We should mention in connection with distributors a new fitting, by means of which part of the sediment is withdrawn from the sprinkler arm and at the same time a concussion of water created in the pipe helps to clear any stoppage in the spray holes. This should be a very useful fitting for revolving distributors, as it obviates the risk of chokage from neglect, and this without the addition of any elaborate plant.

Messrs. Adams also showed their new ejector operated by compressed air electrically compressed, as well as installations of their automatic sewage lift for raising sewage by means of the sewage itself.

Visitors were much interested in the works themselves, which cover a large area, the lighter machinery and fitting department and foundry being on the east side, adjoining the river front, while the sewage disposal and heavier plant shops lie on the west side. Large new shops have recently been added to enable the firm to turn out more expeditiously heavy doors and sluice gates, which are now becoming a speciality with the firm.

The visitors were also able to see an 80-ft. distributor in actual operation under testing conditions. This more practical exhibit, combined with the photographic display of which we have already spoken, made one of the most interesting and instructive items on the congress programme.



A View in Adams-Hydraulics' Showroom, York.

Mansion House Well. The Corporation of the City of London proposes to spend about £1,400 on sinking an artesian well at the Mansion House.

MERSEY AND IRWELL JOINT COMMITTEE.

CHIEF INSPECTOR'S REPORT.

The present year completes the twenty-first year of the existence of the Mersey and Irwell Joint Committee. In the past two years, according to a report covering that period which has just been issued by Mr. Hugh Stowell, ASSOC.M.INST.C.E., the chief inspector, three new sewage works have been completed in the area under the jurisdiction of the board. Alterations and additions have been, or are being, carried out at thirty-five sewage works, and twenty-three local authorities have carried out extensions to their sewerage to intercept districts not fully dealt with, or to provide for the growth of their districts.

Good progress is shown in the number of efficient sewage works. The percentage of efficient works to the total number of works in operation has risen from 66 to 77 per cent, an improvement which, it is satisfactory to note, has been brought about, in most cases, without the necessity of legal proceedings. An unsatisfactory feature of the report is the position of the county boroughs, who have only five efficient sewage works out of fourteen, although at all the inefficient works extensions are either in progress, or schemes are under consideration or have been adopted. Among the total number of twenty-nine inefficient works are seven where extensions are in progress, five for which schemes have been submitted to the Local Government Board, and nine for which extension schemes are under consideration. Of the remaining eight works, four are to be abandoned on the completion of larger schemes which will intercept the sewage at present inefficiently dealt with, leaving four works where in the near future extensions will have to be taken in hand.

CLASSIFICATION OF WORKS.

"The classification of sewage works with regard to efficiency is not," says Mr. Stowell, "easy to settle, and many factors have to be taken into consideration, a very important one being the question of management. There are instances in the watershed where works, although not up to modern requirements, are nevertheless dealing satisfactorily with their sewage owing to careful and good management. On the other hand, there are instances of sufficiently designed works proving inefficient owing to unsatisfactory or insufficient attention, but these are chiefly at the smaller works, where continuous supervision by a skilled manager cannot be afforded. This is a very strong argument in favour of concentrating, where possible, the treatment of sewage instead of installing a number of small isolated works which cannot be so effectively supervised. Sewage treatment on modern scientific lines must be recognised as an operation needing skilled management, which should be provided for by the appointment of experienced and sufficiently paid managers, an expenditure which will undoubtedly prove economical rather than otherwise.

RECENT SCHEMES.

"The noticeable features of recent schemes in the watershed are the continued use of chemical precipitation, which, in this watershed perhaps more than in any other area, has always held its ground, the preference for percolating filters rather than contact beds, and the provision of tanks for the treatment of storm water. Since the last report it has been possible to observe the operation of these tanks at several works where they have been constructed, and the amount of sludge and detritus arrested has been surprising. This is all polluting matter, which was formerly largely discharged into the rivers, and a great improvement has undoubtedly been effected in this direction."

During the past two years (ending December, 1911) 5,220 inspections have been made at sewage works, and 952 samples have been taken, of which 349 were condemned as being of a polluting character, and 603 were passed. Mr. Stowell points out, however, that it is not possible to judge of the progress towards efficient sewage purification by these figures, as a large number of samples are always taken from works which are known to be inefficient, and where pressure is necessary for improvement; for instance, of the 349 samples condemned, just over one-third came from only three sewage works belonging to county boroughs.

RIVERS.

During the exceptionally dry summer of 1911 a certain number of complaints were received and investigated by the joint committee. In every instance but one these complaints referred to the smaller tributary streams, and in the one exception, the complaint about the river Irk was directly attributable to the state of the Wince Brook.

The complaints investigated were generally found to be due to the fact that either the streams were receiving little or no fresh water, and had become merely channels for conveying effluents from sewage works or manufactories, or that the whole stream was being impounded (often several times) and stagnating, with consequent putrefaction of the deposit. Mr. Stowell points out that the joint committee's powers only allow them to require a manufacturer to use the best practicable and reasonably available means for purifying his effluent, and that in ordinary weather such purification is sufficient to prevent nuisance when the effluent is discharged into a normal flow of water; but effluents from such works as bleach-works and print-works, even when reasonably purified, are liable to cause nuisance when not diluted with brook water, and are impounded, or travel over rough, ill-regulated beds of streams. Mr. Stowell adds: "A large diminution of complaints would occur on streams mainly used for manufacturing purposes if all mill dams were regularly cleaned and the beds of streams regulated to allow of an even and concentrated flow. An interesting work on these lines is being carried out in Germany, in the Emscher watershed, where one of the duties of the Watershed Board is the regulation of streams, and they consider that for the prevention of nuisance dilution is not so important as the condition of the bed of the stream. The regulation works consist mainly in substituting concrete channels with a good gradient and smooth surface for the irregular natural bed. It is said that since the regulating works have been carried out, the smaller streams, which in that district had been utilised for conveying practically unpurified sewage, often septic, do not give rise to objectionable odours, though previously they were an intolerable nuisance. This is a work which local authorities ought seriously to consider, especially with respect to smaller streams running through inhabited areas, and there are instances in the watershed where such work has been undertaken with obvious advantage.

"Increasing use is being made of the water even of the main rivers for manufacturing purposes, and a point has been reached when it may be said that practically all the main rivers are available for such use after filtration. When it is stated that such water can be made available at a cost not exceeding one halfpenny a 1,000 gallons, it will be understood that good work is being accomplished. Much improvement is, however, still necessary, especially as regards sewage pollution from the larger sewage works and elimination of colour from trade effluents."

City of London Improvement.—The Corporation of the City of London have decided to give immediate notice to acquire the ground needed to widen the public way between 57 and 69 Leadenhall-street, at a cost of £252,800.

Housing of the Working Classes.—In the House of Commons, on Tuesday, Mr. M. Barlow (Salford) introduced a Bill to amend the Housing of the Working Classes Acts, 1890 to 1909, and the Small Dwellings Acquisition Act, 1899, and to encourage the private ownership of dwelling-houses and business premises among the working classes. The Bill was read a first time.

Safety Locks for Automatic Lifts.—Messrs. Smith, Major & Stevens, Limited, lift engineers, Abbey Works, Northampton, send us particulars of a safety lock which they claim has removed all possibility of danger in connection with the operation of automatic lifts. With this the door or gate must first be completely closed. Until that is done, nothing more can be effected. Next follows the latching of the door, and until that is securely done it is impossible to give current to the machine. Finally current is given. On opening the door the reverse order is equally definite. First the current is cut off, then only can the gate be unlatched, and finally opened. By some recent improvements the general principle described above has been further strengthened against wilful interference by mischievous persons.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

SURVEYING ASSISTANT.—August 10th.—Borough engineer's office of a large Midland town. £130.—Box 1,174, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

TEMPORARY TRAMWAY ASSISTANT.—August 10th.—Engineer's office of large Midland town. £140.—Box 1,173, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

ASSISTANT SURVEYOR.—August 10th.—Rothwell Urban District Council. £65 per annum.—Mr. W. Dodgson, clerk.

CLERK OF WORKS.—August 10th.—Corporation of Northampton. £4 per week.—Mr. A. Fidler, borough engineer.

CLERK OF WORKS.—August 12th.—Thetford Town Council. £2 per week.—Mr. J. Houchen, town clerk.

SURVEYING ASSISTANT.—August 12th.—Corporation of Southport. £2 10s. per week.—Mr. J. Ernest Jarratt, town clerk.

CLERK OF WORKS.—August 13th.—Swansea Rural District Council. £2 10s. per week.—Mr. E. Harris, clerk.

ENGINEERING ASSISTANT.—August 16th.—Surrey County Council. £120—£200 per annum.—Mr. A. Dryland, county surveyor.

SECOND ASSISTANT ENGINEER.—August 16th.—Public Works Department, Shanghai. 250 taels (a tael is valued about 2s. 8d.) per month.—Messrs. John Pook & Co., 63 Leadenhall-street, London, E.C.

ASSISTANT INSPECTOR OF NUISANCES.—August 17th.—Chorley Town Council. £100 per annum.—Mr. J. Mills, town clerk.

JUNIOR ASSISTANT.—August 19th.—South of England county surveyor's office. £109—£130.—The Surveyor, 24 Bride-lane, Fleet-street, E.C.

ASSISTANT IN SURVEYOR'S OFFICE.—August 20th.—Hindley Urban District Council. £78 per annum.—Mr. Thomas Robey, clerk.

JUNIOR ASSISTANT.—August 23rd.—Corporation of Smethwick. £65 per annum.—Mr. Alex. Hosken, borough surveyor.

TEMPORARY TOWN PLANNING ASSISTANT.—August 23rd.—Corporation of Northampton. £2 per week.—Mr. Alfred Fidler, borough engineer.

HIGHWAY SURVEYOR.—August 24th.—Watford Urban District Council. £150—£180.—Mr. W. Hudson, clerk.

ASSISTANT ENGINEER.—August 31st.—Darjeeling Municipality, India. 150 rupees monthly.—The Chairman.

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

ST. AUSTELL.—August 22nd.—For plans and maps of all sewers and connections, together with water main and branch pipes and connections in the district, for the rural district council.—Mr. J. Stephens, clerk.

GOOLE.—September 1st.—Competitive designs and estimates for municipal offices, for the urban district council. Two premiums (£30 and £15).—Mr. R. Tyson, clerk.

CHORLEY.—September 9th.—Designs for a school, for the corporation.—Mr. J. Mills, town clerk.

LLANELLY.—September 30th.—Competitive designs and estimates for school buildings for over 1,000 children, also domestic subjects centre, for the Education Committee.—Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle-street, Cardiff, will act as assessor and award premium.—Mr. I. W. Watkins, clerk, Education Offices, Coleshill-terrace, Llanelly.

WANDSWORTH.—October 14th.—Competitive designs for public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas.—Mr. J. Henry Field, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

ABERDARE.—August 10th.—For the erection of thirty-two tenement dwellings, for the urban district council.—Mr. T. Phillips, clerk.

HUNTS.—August 10th.—For the enlargement of a secondary school, for the Education Committee.—Mr. S. G. Cook, clerk, County Education Offices, Huntingdon.

WOMBWELL.—August 10th.—For the erection of public baths, for the urban district council.—Mr. P. M. Walker, clerk.

SLEAFORD.—August 10th.—For repairs to bridges, for the rural district council.—Mr. E. Clements, clerk.

KINGSTOWN.—August 10th.—For the erection of baths and wash-houses and caretaker's house, for the urban district council.—Mr. J. Sherlock Vaughan, town clerk.

DISS.—August 12th.—For the erection of a cottage at the waterworks, for the urban district council.—Mr. A. Cooper, surveyor, The Terrace, Diss.

MERTHYR.—August 12th.—For the erection of forty-eight dwellings, for the corporation.—Borough Architect, Town Hall.

CARDIFF.—August 12th.—For the erection of two cottages, for the corporation.—Mr. W. Harpur, city engineer.

TAVISTOCK.—August 13th.—For the construction of works of water supply, for the rural district council.—Mr. A. Kenneth G. Johnstone, clerk.

DEAL.—August 14th.—For the enlargement of school buildings, for the education authority.—Mr. A. Brown, town clerk.

RADCLIFFE.—August 14th.—For alterations and additions to the technical school, for the education authority.—Mr. S. Mills, clerk.

BARNSTAPLE.—August 15th.—For works at Knowle Braunton, including reinforced reservoir, and water main, for the rural district council.—Mr. R. E. C. Balsdon, clerk.

BLAYDON.—August 16th.—For the erection of sixteen to twenty houses, for the urban district council.—Mr. G. Symon, surveyor, Blaydon-on-Tyne.

SOUTHEND.—August 17th.—For the erection of a lodge and refreshment-room, for the corporation.—Mr. E. J. Elford, borough engineer and surveyor.

HANTS.—August 19th.—For the erection of a classroom, for the county council.—Mr. A. L. Roberts, architect to the Education Committee, The Castle, Winchester.

HANTS.—August 21st.—For repairs, decoration, redrainage and conversion works, for the county coun-

The Surveyor

And Municipal and County Engineer.

Vol. XLII. AUGUST 16, 1912. No. 1,074.

Minutes of Proceedings.

Road Reform.

A considerable portion of the matter which we reproduced last week from the annual report of Mr. G. H. Jack, county surveyor of Herefordshire, bears upon the subject of road reform, and the report furnishes strong evidence of the soundness of views which we have put forward on this subject for some time past. Clearly many of Mr. Jack's roads need catchwater drains and that kind of drainage which effectually and quickly reduces the water level after rain to a considerable number of inches below the surface of the crust. His road crusts lack sufficient thickness—4 in., for instance, being hopelessly inadequate on clay soil, even for by-roads. As regards the immediate future, surveyors who are better situated as regards subsoils must not overlook the fact that a system of road reform which has been advocated in these pages is not capable of application in the simplest manner to roads with very thin crusts on soils which are soft for even a small part of the year. We allude to the system by which a small proportion of the total mileage of roads is thoroughly reformed every year and provided with crusts of adequate thickness and suitable type, this being done with the funds provided by starving not the whole mileage, but those parts of the roads which are to be reformed during the next few years, more especially the parts the reform of which will be undertaken in the year immediately following. It is assumed that these lengths of road are carefully preserved as far as possible by constant small repair, a little more than usual being spent in this way in order to save a far larger sum represented by the road metal withheld. This system can be applied either when the soil is a hard and good one, such as chalk or hard gravel, or when the crust, though a bad one, is fairly thick. It cannot so easily be applied in the case of roads with thin crusts on weak soils, or on soils which become very soft for a part of the year.

We venture, however, to suggest that in such cases the desired end may be gained by the same system carried out in two stages. Suppose that a 4-in. crust, on clay, demands heavy annual expenditure per mile, largely incurred by the use of considerable quantities of costly road metal. Let us in imagination take a length of, say, 10 miles and deal with it in five years. The first year starve the first 5 miles, treating the last 5 miles as before. The second year reform the first 5 miles as regards drainage, camber and earth-work generally, and put down a crust of adequate thickness of cheap materials, especially thick at the edges, in the meantime starving the last 5 miles and putting no hard metal at all on any part of the 10 miles. The third year make up 3 miles thoroughly with a wearing crust of hard metal on what remains of the cheap subsoil, the whole thickness being adequate, the least possible amount of material being put down on the remaining 7 miles. The fourth year do the same with the next 3 miles, starving the remaining 4, but keeping the first 3 miles with great care. The fifth year reconstruct the remaining 4 miles, thus bringing the whole up to its final state of strength and efficiency. Each length of road would thus pass through the following phases: (1) Starvation with constant small repair; (2) Reconstruction as regards drainage, earth-work and levels, and the placing of, say, 10 in. of fairly good sandstone or limestone; (3) Constant small repair of this surface during a period of small settlements and the wearing down of the 10 in. to say 7 in; (4) The scarifying and careful preparation of this crust and the placing of a course of 4 in. or 5 in. of hard stone as a wearing layer. The final result will be better, we imagine, than that which would be obtained by doing the drainage and reconstruction work on the bed and forthwith placing the final crust. The above is, of course, a mere sketch, and the actual procedure would vary with different circumstances.

Space does not permit of further comment on Mr. Jack's valuable report, but we note that he recognises that the high speed of motor vehicles at sharp bends is a cause of expense in road maintenance—the effect being, it may be observed, increased by the fact that on open roads and on turnings which have been "improved" a large proportion of the vehicles bending to the right use the same part of the road as those proceeding in the other direction. Lastly, it may be observed that Mr. Jack states in one part of his report that on the much used part of the roads "the water binding will have to give way to something more adhesive and waterproof." He states elsewhere, however, that on the strong roads and roads not subject to engine traffic "the existing system of waterbound metalling with Clee-hill binding material will suffice for a long time to come."

* * *

Conversion of Old Sewers into New.

The paper read by Mr. O. E. Winter, Assoc.M.Inst.C.E., borough engineer and surveyor of Hampstead, at the annual meeting of the Institution of Municipal and County Engineers last month, deserves a better title than that under which it was presented. "Maintenance, flushing, and cleansing of sewers" indicates an uninteresting description of some of the humdrum administrative duties of a municipal engineer, whereas the paper, which we print on another page, contains some

very interesting data upon two unusual methods of reconstructing and bringing up to date of old brick sewers, the effects of flushing and cleansing sewers, and the source of offensive odours from sewers. The fact that, in some cases, pipe sewers 15 in., 12 in., and even 9 in. in diameter were found to be large enough to take the present flow in existing brick sewers varying from 3 ft. by 2 ft. to 4 ft. by 2 ft. 8 in., gives some idea of the waste of money occasioned by the old-fashioned ideas of the sizes of sewers, and shows the saving effected by modern methods of scientific calculation. The information given as to the effective life of brick sewers is also interesting, and gives grounds for assuming that, when constructed of the best material throughout, they may be expected to have a life of forty to fifty years. At the same time we do not think this provides any good reason either for increasing or reducing the periods for which loans are granted by the Local Government Board for works of this kind, as suggested by some of the speakers during the discussion upon the paper. The method adopted by Mr. Winter for renewing the inverts of those sewers where the present flow of sewage did not permit of any reduction in the size of the sewer was ingenious, and it has enabled him to convert the old sewer into a new one, probably more durable than the original, at a comparatively small outlay considering the difficulties of execution.

The most interesting feature of the paper, however, which does not appear to have been mentioned in the discussion, is the result of the thorough cleansing of the sides and crown of the sewers. As the alterations to the sewers were completed, there was a marked improvement in the air within the sewers, but in addition to this the very efficient system of regular cleansing of all the sewers carried out by Mr. Winter's staff is well worthy of imitation. The author's expression of opinion as to the importance of regular and systematic flushing of sewers is emphasised by his further statement that it is "*absolutely necessary* in keeping the sewers in a clean condition and free from nuisance." In this matter the words "regular and systematic" are the essential qualifications to bear in mind, as irregular, occasional flushing here and there in a system of sewers is almost as bad as none at all so far as the effective prevention of nuisance is concerned. In large towns an efficient staff of flushers can be maintained, but in smaller towns and districts the use of automatic flushing syphons suitably arranged, and inspected at regular intervals for the purpose of giving any attention that may be necessary, and adjusting the rate of supply of water to give a greater or less number of discharges per week according to the season of the year or other special circumstances, would appear to be the most satisfactory method to adopt. In this connection it is interesting to note the testimony of some of those who took part in the discussion as to the efficiency of automatic tanks, and also to the success of the special pipe joint used by Mr. Winter in the work described in his paper. The experience related in the paper fully justifies the opinion expressed by Drs. Andrewes and Hurtley in their report to the Hampstead Borough Council on sewer ventilation to the effect that the source of smells from ventilating manhole covers is to be found in decomposing organic matter and fungoid growths on the sides of sewers, and not in the flowing sewage itself.

* * *

Madras Water Supply: Mr. Madeley's Report.

We are indebted to Mr. J. W. Madeley, M.Inst.C.E., for the opportunity of placing before our readers the main features of his water distribution scheme for Madras City, as set forth in a report of unusual interest and great value which he has kindly sent us. With regard both to the collection and the distribution of the water, the conditions at Madras are unusual. The natural features of the country whence the water is derived, and the methods of cultivation pursued, while they have rendered possible the collection and storage of a sufficient supply of water at a moderate cost as regards capital expenditure, are, at the same time, such that great care has to be exercised in order to preserve the water from contamination, while the moderate rainfall, the great rate of evaporation under a tropical sun, and the lack of certainty that really heavy falls of rain will follow one another at short intervals, even in the monsoons—all these factors introduce an element of uncertainty as regards the run-off, which must be counteracted by sufficient storage and by great care in the matter of waste prevention.

Mr. Madeley has, however, the satisfaction of knowing that there is always available in case of need that share of the water which is at present used in irrigation. The public works department, which places the water partly at the disposal of the corporation and partly in the hands of its own irrigation branch, has, during the past nine years, derived on an average a revenue of nearly Rs.22,000 from the water used for the supply of the city, and only some Rs.10,000 from the water used for irrigation. In the year 1889–1890 we find, in turning up the records, the shares were nearly Rs.11,500 from the corporation, and Rs.22,500 from irrigation, and in 1896–1897 we find, corporation Rs.16,700, and irrigation Rs.20,800 (nearly). It is clear that from this point of view the conditions have changed, the corporation share having become the larger instead of the smaller. A more important consideration is, however, that the revenue from irrigation, even if taken to represent a total crop value eight or nine times its amount, represents only some $2\frac{1}{2}$ per cent on the amount of the estimate for the works distribution alone. There is the further consideration that there are obvious disadvantages in cultivation by irrigation within the limits of the city. Paddy fields are not a very desirable feature even in those parts which are occupied partly by large bungalows standing in park-like compounds of great size, and partly by native villages which have most of the features of mofussil villages, and some of which consist largely or wholly of mud huts thatched with palm leaves. In view of the prevalence in Madras of a mild form of malarial fever, it is very desirable that the breeding places of mosquitoes should be as far as possible eliminated. A good water supply, by reducing the necessity for using wells and ponds, and by making it possible to flush the sewers properly, will doubtless go far towards making the more open parts healthier and, when supplemented by the improved system of sewerage, on which Mr. Madeley is also engaged, will have a further beneficial effect in the areas of a definitely urban type.

* * *

Some Notable Features of the Scheme.

As regards the distribution of the supply, the most striking features of the city are its flatness, its great size, and the marked distinction between the parts that are in themselves little cities or small towns and the other parts which are occupied by scattered houses and their grounds, by fields, by villages, and by country roads. It is no easy task to design a water-supply system which will suit the commercial seaport town of Georgetown, the native city of Triplicane, suburban Egmore, the town of Mylapore, and the villages scattered about in Adyar, all within the city limits. As regards the use of local pressure reservoirs it is worthy of note that Mr. Madeley proposes to hold these in reserve in order that, with the system of distribution mains which is now to be provided, it may be possible to furnish a considerably larger future population with a supply per head per day in excess of that now contemplated, simply by erecting these tanks in suitable places.

That part of the report which deals with rainfall, evaporation, and the available run-off is well worth study as an investigation of interest in itself, apart from its particular application, and the same may be

said of a great deal of the matter under the head "Prevention of Waste," a very useful study of this subject as applied to the conditions of an Oriental city. The Public Works Department of Madras is to be congratulated upon the fact that when the report based upon the instructions given to Mr. H. Nowroji—and faithfully carried out by that officer—came for scrutiny to the Technical Section of the Chief Engineer's Office, it was dealt with in a vigorous fashion which resulted in the recommendation, adopted by the Government, that Mr. Madeley should be entrusted with the preparation of a coherent scheme for which he could make himself responsible. The earlier instructions, it may be noted, had included two conflicting orders: the cost of the distribution scheme was to be kept "as low as possible" and it was to ensure "a complete and satisfactory distribution of the water provided." The report before us, relating as it does to the water supply of an Indian city of over half a million inhabitants, is one of the most important and valuable documents of the kind that we have ever seen, and marks an administrative change of much importance to the city and Presidency.

* * *

Sanitation in Small Urban Districts.

We have on more than one occasion directed attention to the excellent work which is being done by the Local Government Board in holding inquiries into the sanitary circumstances and administration of districts in which the public health services are not being carried out in an efficient or up-to-date manner. We have before us such a report in regard to the urban district of Mallwyd, Merionethshire, in which Dr. Morgan Rees, the board's medical inspector, expresses the opinion that the district abounds in conditions inimical to the health of its inhabitants, and that little has hitherto been done by the district council to secure removal or amelioration of these conditions. The worst features appear to be the inadequate provision of housing accommodation and a small water supply, which is liable to contamination. It is interesting to observe that the joint appointments of surveyor, inspector of nuisances and waterworks manager are filled by an officer who "holds no special qualification," and who is rewarded with the princely payments of £3 a year in respect of each of the first two offices, while his salary for the last-named appointment is 9d. a week! It is only fair to point out, however, that Dr. Rees expressly states that, while the council are to blame for their large degree of failure to carry out their duties as guardians of the public health, it must be recognised that the decreasing population, the dwindling industry, and the low assessable value of their district are circumstances that tend to hamper effective action on their part.

The circumstances which exist in Mallwyd are merely a particular example of a general evil—namely, the practical impossibility of securing sanitary efficiency in small urban districts. This matter was dealt with at some length in the annual report for 1904-5 of the board's medical officer. "It is a matter for serious consideration," he said, "whether the creation of small urban districts is in the true interests of efficient sanitary administration. Subdivision of administrative districts leads, in the aggregate, to larger disbursements in the way of salaries, due to the multiplication of officers, and in the way of office accommodation for these and for the local authority. To justify this increased expenditure the counterbalancing consideration should be increase of administrative efficiency. In districts that, after subdivision, still remain of considerable importance, this result may, perhaps, be attained, but it may be apprehended that a point of subdivision is not infrequently reached at which the increased expenditure is accompanied by diminished efficiency. If a district be so small that the salaries offered cannot secure competent officers; that it cannot afford the expenditure necessary for works of water supply, sewerage, and so forth; that it is unable to provide efficient means of disinfection and hospital accommodation for its infectious sick, and so has to attempt, often without success, to effect these ends by combination with neighbouring authorities—the result of subdivision is clearly decrease in efficiency of administration.

* * *

Town Planning Progress.

"The dreams of the idealist must be transmuted by the alchemy of common sense into something practical before they can serve as a basis for town planning and the laying out of garden cities." Although these words formed the conclusion of the paper on "Housing and Town Planning Progress," which was read at the Royal Sanitary Institute Congress by Mr. H. Gilbert Whyatt, ASSOC.M.INST.C.E., the borough engineer and surveyor of Grimsby, they might appropriately have been placed at the head as a "text." After giving statistics showing the progress which has been made in regard to town planning since the Act of 1909 came into force, Mr. Whyatt pointed to certain practical aspects of the question. In regard to restricting the number of houses per acre, he emphasised the fact that small houses must be allowed—"otherwise two or three families will inevitably arrange to occupy one house, and the interior of the house will be a slum, while the exterior is everything that could be desired in a garden city." Moreover, it must be remembered that unless the preparation of a scheme is followed by the development of the land by the builder, the scheme is abortive, the landowner is injured, and houses will be erected on other estates which are not subject to town planning restrictions. Mr. Whyatt also performed a useful function in pointing out what can be done without the preparation of a formal scheme under the Act. If there are no relaxations of by-laws, and if landowners will agree to lay out their estates on town planning lines, there is no need to go to the Local Government Board at all, and both time and labour will be saved. Further, a voluntary scheme of this kind implies that harmony between the landowner and the local authority which is so necessary if any effective work of town planning is to be accomplished.

* * *

Housing and By-Laws.

The Engineering and Architecture Section of the Royal Sanitary Institute Congress was under the able presidency of Mr. J. Walker Smith, M.INST.C.E., the chief engineering inspector to the Local Government Board for Scotland. In his inaugural address, which we publish in another column, Mr. Walker Smith spoke generally of the respective functions of the architect and the municipal engineer in regard to town planning, and instanced as an example of what ought to be done the commission of engineers and architects which was appointed to co-operate and collaborate in planning the new city of Delhi. Speaking of the housing problem, Mr. Walker Smith made some very pertinent observations as to the undesirability of perfectly rigid by-laws. It is, of course, necessary for the public to receive adequate protection against the operations of the professional jerry-builder; but when it is realised that existing by-laws only too frequently operate to render remunerative development of land for housing purposes an impossibility, the case for a wise relaxation should need no further advocacy. The Scottish Dean of Guild Courts, the constitution of which was explained by Mr. Walker Smith, have very useful powers in this direction, which could with advantage be conferred on a body in England which might be charged with the power and duty of suspending or modifying by-laws upon good cause being shown.

The Water Supply of Madras City.

PROPOSED NEW WORKS: MR. J. W. MADELEY'S REPORT.

In 1907 Mr. J. W. Madeley, M.INST.C.E., was appointed special engineer to the corporation of Madras, for the new works of water supply and sewerage. As regards the latter he was entrusted with the design of the scheme of sewerage to supersede the existing partial and unsatisfactory drainage of the city, as well as with the organisation and execution of the works. With respect to water supply it was intended that he should carry out the improvements recommended by Mr. H. Nowroji, who had been previously deputed to prepare a scheme. In the meantime, however, ideas on the subject had enlarged, and it was clear that the instructions given to Mr. Nowroji had not been wide enough nor sufficient to form the basis of a satisfactory scheme, though contributing to its substance. The proposals, together with Mr. Madeley's remarks, were considered by Government in 1909, being submitted to scrutiny in the Technical Section of the Chief Engineer's Office. As the result of this study the president of the corporation was requested to have the plans and estimates revised by the special engineer, the scheme to be placed before the corporation and the Government was to be that prepared by him, and he was to take full responsibility in the matter. In accordance with this order Mr. Madeley went into the whole matter and prepared a report, a copy of which he has kindly sent us. It is dated September, 1911, and contains a clear account of the factors affecting the situation, and Mr. Madeley's proposals for the distribution system within the city. It may be pointed out that in the meantime a covered conduit is being made to replace the old open channel from the reservoir to the city boundary, and will probably be finished by the end of 1912. The works which form the main subject of the report are the pumping station, the elevated tank and the system of mains; but references are also made to the reservoir, and the subject of the sufficiency and extent of the available supply is gone into very carefully. Use will be made of the old mains where they are still serviceable.

In the introduction to his report Mr. Madeley urges the importance of carrying out with as little delay as possible the following works:—

(1) The construction of the pumping station and the erection of the pumping engines.

(2) The erection of the elevated tank.

(3) The laying of the two large mains to the north and south of the city respectively.

It is expected that the conduit from Red Hills tank will be finished by the end of 1912, and the filters, now in course of construction at Kilpauk, some six months later, and these will come into use as soon as the pumping machinery, for which a contract has been let, is completed.

Special attention is drawn to the importance of preventing waste, and the use of taps with limited discharge is recommended for street fountains.

The total cost of the works recommended in the report is a little over 42 lakhs of rupees, or, in round figures, £280,000, and the following abstract gives the chief items of the estimates:—

	Rupees.	Sterling.
Engine and boiler house, engine foundations, pump wells and chimney	1,82,850	£12,190
Engines, pumps and boilers...	3,90,000	26,000
Elevated iron tank and low-level storage channel ...	3 20,300	21,353
Certain connections	20,700	1,380
Pipes and specials, valves, meters, laid complete, including labour and materials	30,30,000	202,000
Masonry work connected with distribution scheme... ...	2,65,110	17,674
Total	Rs. 42,08,960	£280,597

It is proposed to instal more powerful pumping engines and to construct a higher elevated tank than was originally contemplated. There has also been a large increase in the cost of labour and materials.

Supervision will be necessary in order that the water may be drawn off from the purest stratum only, and not from the top, where floating impurities collect, nor from the bottom, where sediment accumulates. The conduit will require periodical inspection, and the roughing filter frequent cleansing. Above all, it will be necessary to work the filters carefully and in a systematic manner. The pipe system will need careful watching to prevent contamination and the waste or misuse of water. The whole system should be under the supervision of an expert engineer. Mr. Madeley concludes his introduction by pointing out that Madras has now reached a stage of development at which it is desirable to place the different works of the corporation under different men, to each of whom would be delegated such powers that the chief engineer of the corporation would be saved much of the routine work that now occupies a large share of his time.

THE QUANTITY OF WATER AVAILABLE.

The general scheme, of which the distribution works described in this report are a part, allows for a supply of 25 gallons per head per day. This is likely to be exceeded unless the supply is carefully conserved. The rate in Bombay is about 40 gallons, and in Calcutta 27½ gallons of filtered water and 20 gallons of unfiltered water. In August, 1909, it was strongly urged by certain members of the corporation that a much larger supply should be provided, and it was, in consequence, decided that the quantity available should be ascertained before the 25 gallons was accepted as a final figure. The investigations included a study of—(1) Increasing the storage capacity of the Red Hills tank; (2) raising the lowest level for the use of irrigation water from Red Hills tank [that is, curtailing the use of the water for irrigation]; and (3) the effect of pumping at Red Hills upon the health of the inhabitants of Madras. [This "pumping at Red Hills" means the use of pumps to lift the water from the tank into the supply channel, when the level is so much reduced that it no longer flows in. The quality of the water so pumped is usually inferior to that previously drawn off.]

THE EXISTING WATERWORKS.

The Madras water supply is a part of a project for utilising the water of the Corteliar river, the upkeep and maintenance of the works being in the hands of the Public Works Department. The quantity used for irrigation is about three times that supplied to the city. The corporation pays 1 rupee per 1,000 cub. yds., or a little less than a tenth of an anna (tenth of a penny) per 1,000 gallons, and maintains a staff of men to prevent contamination of the Red Hills tank by cattle-washing, bathing, &c. A general idea of the situation may be obtained from Fig. 1, which is based upon one of the plates in the report. The anicut (weir) at Tamarapakam, where the river crosses the dotted line in Fig. 1, diverts the water of the Corteliar river into the Cholaveram tank by a channel, which also intercepts the waters of some small tributaries. A part of the run-off of the Corteliar catchment is, however, diverted into the Coum by the Kasavaram anicut. The smallest of the catchment areas shown is that of the Red Hills tank itself. It may be pointed out that these rivers only flow for short periods in the year, and are, under natural conditions, usually either sandy wastes or a succession of buffalo wallows, and stretches of sun-baked mud, thinly grassed.

When they flow, during the rainy season or in occasional cyclonic storms, the water is diverted to the "tanks" or shallow ponds which are dotted thickly over most of this coastal plain, and occupy a considerable portion of the total area. The water is used for irrigating crops, and in favourable seasons the irrigated area "under" one tank reaches nearly to the shallow end of the next tank. In many cases the seepage under the bund at the deep end supplies wells from which water can be drawn when the tank itself is dry or when the pools at the deep end are below draw-off level. In addition, there is some direct use of the receding waters on the nearly level ground along the shallow upstream margin, and when the water recedes from this area grass springs up and provides grazing land for a period depending upon the very variable, but sometimes considerable, casual rainfall of the dry season. It is from two such tanks, improved, protected, and adapted for the purpose of a water supply, that the supply of Madras

city is derived, while a larger quantity, not necessarily available, or fully available, for the use of the city, irrigates areas near and within the city boundary.

YIELD AND DEMAND.

Mr. Madeley's report gives the following figures for yield and demand. The estimated population on which the water supply study is based is 660,000, for which, at 25 gallons per head per day, the quantity needed is, in round numbers, 1,000,000,000 cub. ft. per annum, or, for a supply of 75 gallons, 3,000,000,000 cub. ft. The irrigation demand is 1,500,000,000 cub. ft. in the season including and following the north-east monsoon, September to February, and 544,000,000 cub. ft. in the season from March to June, the driest season of the year. Evaporation and percolation are taken as 9 ft. per annum over an average area of 140,000,000 sq. ft. for Red Hills tank, and 42,000,000 sq. ft. for Cholaveram tank, or a total loss of 1,638,000,000 cub. ft. All this information is plotted to curves in the report.

The total estimated yield from the catchment of 977 square miles is based upon an assumed fall of 27 in. in the north-east monsoon. October-November-December, and 14 in. under the influence of the south-east monsoon conditions, which usually begin in June, and may last for one, two, or three months, according to the strength of the monsoon. Taking the yield as from a "a bad catchment," and the figures given in Strange's "Indian Storage Reservoirs," the yield would be 1,194,000,000 cub. ft. If the monsoons were continuous and the yield "average" the quantity would be 3,860,000,000 cub. ft. Mr. Madeley regards the mean of these two quantities as fairly near the truth—that is, in round numbers, 2,500,000,000 cub. ft. a year. Direct measurements at Tamarapakkam anicut have also been used in calculating the yield. The areas of the catchment basins above and below the anicut are 837 and 140 square miles respectively, but the discharge per square mile for the smaller area is taken as 10 to 6, compared with the larger area. The reason for this may best be given in Mr. Madeley's own words: "At first sight this would appear surprising in view of the hilly nature of part of the larger catchment area, for the proportion of run-off to rainfall should be greater in a hilly district than in a flat district. With regard to this point, it may be remarked that though the number of tanks in the larger area is proportionately less than in the smaller area—there are 613 tanks in 837 square miles, as against 141 in 140 square miles—yet, because the former (613) are of greatly larger average capacity than the latter (141), it is found that the storage provided per square mile—and therefore the loss by percolation and evaporation—is decidedly greater in the case of the larger watershed. In addition, the average rainfall at Arkonam, about the middle of the 837 square miles catchment, is only 38 in. per annum, against 49 at Madras. Furthermore, the hills at the source of the Nagari river are in the most rainless part of the basin, so that the rainfall there provides a proportionately small run-off. Finally the discharge per unit area for a given rainfall from a small compact catchment is greater that for a large catchment area where the water flows over a large area, which at the beginning of the rains is dry and parched, and absorbs a large quantity of water. When all these factors are taken into account, it is seen that the estimated yield of the catchment draining directly to Red Hills and Cholaveram is not unreasonably high compared with the measured yield from the catchment above Tamarapakkam anicut."

It may further be pointed out, as showing the necessity for the thorough investigation of the facts undertaken by Mr. Madeley, that the north-east monsoon sometimes consists of a series of weak cyclonic disturbances with only a few falls of heavy rain—and it has been known to fail altogether. Sometimes the rains of the summer months include a number of really heavy falls, but in other years they consist largely of quite small showers, which have no direct run-off value, some of the smaller ones having no value at all.

THE AVAILABLE SUPPLY.

Taking the average of nineteen years, Mr. Madeley finds the annual yield to be 3,700,000 000 cub. ft. The full supply required in the past has been 4,100,000,000 cub. ft., and the shortage has been assigned to "irrigation." After deducting 1,638 000,000 cub. ft. for evaporation and percolation, the amount available would be 2,062,000,000 cub. ft., or 53 gallons per head per day if adequate storage were provided. For a series of three years, such as the worst three recorded, the storage would have to be 5,000,000,000 cub. ft. The actual storage, not allowing for pumping the dregs of the reservoir, is: Cholaveram tank, 500,000,000 cub. ft.; Red Hills tank, 1,712,000,000 cub. ft.; total 2,212,000,000 cub. ft. By raising the level of Red Hills tank by 18 in. this could be increased to 2,795,000,000 cub. ft. A supply of 75 gallons per head per day cannot be provided during dry years.

The following facts are brought out by a study of the curves:—

(1) That with 25 gallons per head per day, and a population of 660,000, there would have to be a shortage of irrigation water in many years, and there would be barely enough for the city in some years.

(2) That the quantity now supplied to Madras is, as it has been in the past, insufficient for both supplies.

(3) The available yield is enough to supply 50 gallons per head per day if all irrigation were stopped.

(4) With the present storage only 35 gallons could be provided, even if irrigation were stopped. A storage of 5,000,000,000 cub. ft. is needed to make available the yield of 3,700,000,000 cub. ft.

(5) The existing storage, 2,212,000,000 cub. ft., should be increased.

(6) The question of restricting Red Hills tank to the supply of Madras City is one which will have to be considered before long.

Mr. Madeley points out that the figures which he gives are based upon hypothesis and estimates, and that it is therefore necessary to begin to make accurate records by measurement as soon as possible.

He then goes into the question of the effects of storage. In the past the pumping has not supplied all the water needed; it has merely lessened the effect of the shortage. The average cost of pumping has been 16,000 rupees (well over £1,000) per annum.

The effect of this pumping from below draw-off level is strikingly shown by one of the curves in the report, from which Fig. 2 has been prepared. The death-rate for cholera goes up suddenly after pumping has been continued for some time, and the nine months of pumping and the low-water level reached in 1905 correspond to the worst cholera epidemic in the period under review.

RAISING THE FULL TANK LEVEL.

The full tank level can probably be raised 18 in., and another 18 in. could be gained by a temporary bund of clay on the top of the weir. It would pay the corporation to do this work, provided the level at which water may be used for irrigation were also raised.

The increase in the storage, if the level were raised 18 in., would be 277,616,300 cub. ft., the total capacity 2,439,670,300 cub. ft. If the lowest level for the taking of irrigation water were raised 18 in. the increased storage reserved to the corporation would be 175,000 000 cub. ft., or, after allowing for percolation and evaporation, enough to supply the population with 25 gallons per head per day for thirty days. In good seasons irrigation would be benefited by these two measures, and hardly any loss would be sustained by irrigation in dry years. The increase in the city's supply would involve an additional payment to Government by the corporation of about Rs.15,000 (£1,000) a year.

PUMPING PLANT AND PUMPING STATIONS.

Assuming an average supply of 25 gallons per head per day, Mr. Madeley concludes that the pumping plant should be capable of supplying water at a rate three times this: "When the pipe system had been worked out on these assumptions it was found that, to insure an adequate pressure all over the city, the top-water level of the elevated tank should be 84 ft. above mean sea level. The pumping plant has been designed on the basis of these data."

The corporation have entered into a contract with Messrs. James Simpson & Co. to supply and erect the plant complete for Rs.3,90,695. These pumps will be of 873 pump-horse power. Taking the population to be supplied at 550,000 during the first ten years, the pump-horse power required will be 231½, and the guaranteed coal consumption of 1·75 lb. per pump-horse power hour, 0·75 lb. for losses, and a margin of 0·5 lb. for lighting and drawing fires, gives a consumption of 3 lb. of Indian coal per pump-horse power hour. To raise 13¾ million gallons per day to a height of 80 ft. 231½ pump-horse power will be needed or, in the year, 2 000,000 pump-horse power hours. The quantity of coal used will therefore be 2,678 tons per annum. Allowing Rs.768 a month for establishment, the estimate becomes:—

	Per annum.
Establishment	Rs.9,216
2,678 tons of coal at Rs.14 per ton ...	37,492
Oil, &c.	3,000
Repairs	3,000
Total	Rs.52,708

The estimated cost in the original scheme was Rs.60,000. In the present estimate the height to which the water will be raised is 50 per cent greater, and the rate allowed for coal is higher. The new plant will comprise three pumping engines, each capable of delivering 12,000 gallons of water per minute against a maximum total head of 80 ft., including suction lift, delivery pressure and friction. The three boilers will each be capable of supplying steam to any two engines working together against the total head of 80 ft. It will be possible to work any two engines from any two boilers, and to clean or repair any engine or boiler without interfering with the other engines or boilers. Any two pumps will be capable of working at the same time and of pumping up into the elevated tank a total of 24,000 gallons of water per minute from the pure-water reservoirs. On leaving the pumps the water will be forced through a 4-ft. diameter main to the distribution system. The engines will be horizontal, direct-acting, compensated, high duty, surface condensing Worthington engines, each having two sets of steam cylinders, and two double-acting main pumps arranged in line with also be provided, to record the height of the suction lift and the head against which the pumps work.

Two designs have been prepared for the pumping station, one being a plain building of "country" bricks and surki mortar, plastered inside and out with lime mortar. Mr. Madeley does not recommend this design, but puts forward another for a building of better appearance, and one in which the machinery is likely to be maintained in better condition. "If," he says, "the building is mean in appearance, hot, badly lighted or ill-ventilated, the machinery is sure to suffer."

THE ELEVATED TANK.

The design recommended for the elevated tank provides for a capacity of 1,500,000 gallons. The diameter is 104 ft., and the depth of water is 28 ft. It has a flat bottom, 37 ft. from the ground, and the roof is 73 ft. above ground. It is to be of steel, with a steel roof, 6 ft. 6 in. above overflow level. Only a small proportion of the water will pass through this balancing tank, and one pipe will serve as inlet and outlet, a 36-in. branch from the 48-in. main.

The surface soil, where the tank will be built, is clay, but at a depth of about 8 ft. there is a sandy loam, on which the foundations will rest, with a pressure of 1½ tons per square foot.

The materials of the tank will conform to the British standard specification for structural steel for shipbuilding. The thickness of the top plates is calculated by allowing a ¼-in. minimum and

Fig. 1.—Madras Water Supply: Catchment and Tanks.

the steam cylinders, and driven direct by prolongations of the piston rods. The main pumps will be Worthington multiple-valve pumps, double acting on both suction and delivery. In each engine the pumps will be duplicate.

An automatic safety attachment will be fixed on the delivery of each main pump, which will stop the engines and immediately warn the attendant should a pipe burst or should the main be closed by the accidental shutting of a valve.

The boilers will be three in number, of the Babcock & Wilcox type. The total heating surface of each boiler will be 1,426 sq. ft., and the grate area 36 sq. ft. The working pressure will be 160 lb. per square inch. Each boiler will be composed of seven sections, and each section will be made up of nine seamless steel tubes, 4 in. in diameter and 18 ft. long, expanded at the ends into staggered "headers." Each boiler will be provided with a chain grate stoker, having an area of 36 sq. ft. The grate will consist of an endless chain of short cast-iron bars, linked together, running on rollers, and driven by a drum at the front end.

Three Babcock & Wilcox superheaters will be provided, each of 248 sq. ft. of heating surface. These will superheat to 150 deg. Fahr. under normal working.

There will be a Venturi meter on the 48-in. pumping main, with a throat ratio of 1 to 6, and a range of registration from 120,000 to 1,800,000 gallons per hour. A water-level and pump-pressure recorder will

another $\frac{1}{16}$ in. for corrosion. The next row will be $\frac{3}{4}$ in. thick, and the increases with depth bring the bottom row to a thickness of $\frac{15}{16}$ in. The vertical joints are to be butt joints, with internal straps, and double riveted except in the top row. The horizontal joints will be single riveted lap joints. The central overflow pipe, 36 in. in diameter, also serves as a support for the steel roof. It is bell-mouthed at the top to a diameter of 7 ft., which allows for the maximum overflow with a depth of 9 in. on the lip. The roof will be chiefly of ¼-in. plates, domed to a radius of 200 ft., carried on twenty-four main and twenty-four intermediate rafters, formed of 5-in. by 4-in. by ½-in. tees, trussed with steel rods and bars. The purlins will be mostly steel angles.

The tank will rest upon an outer ring of piers and arches in brickwork and concrete, and upon ninety-six internal steel stanchions, with centres 11 ft. by 6 ft. 6 in. apart, and arranged in fourteen rows, each row carrying two continuous 15-in. by 6-in. rolled-steel beams, 2 ft. apart, centre to centre, each beam stiffened by a 12-in. by ½-in. plate riveted along its bottom flange.

The stanchions and beams will be encased in concrete. Each stanchion will be 34 ft. 6 in. high, and will consist of two 10-in. by 3½-in. channels, fixed 4½ in. apart by means of ½-in. plates, 12 in. wide. The base of each stanchion will be 3 ft. 6 in. square.

Alternative designs for a steel tank and steel supports may be submitted, and any such design as in

the opinion of the engineer shows a substantial advantage over the proposed design will be carefully considered. The tank itself must be of steel.

THE DISTRIBUTION SYSTEM.

The existing distribution system fails in all the essential features of a good system. It is insufficient for reasonable requirements, and over a considerable area it fails during the part of the day when water is most needed. The pressure is almost everywhere deficient, and there is much waste. One of the objects of Mr. Madeley's investigation was to determine what is required to remedy these faults and to provide for a complete and satisfactory distribution of water, also to estimate the cost. To this end Mr. Madeley made a careful study of population statistics, the rates of increase in different areas, and so on. The pipes are designed to carry a maximum quantity of 75 gallons per head per day for a population of 660,000, with one elevated tank, that at Kilpauk. Should the increase in population be greater than is expected in any district it will only be necessary to erect a small tank sufficient for that district. Thus "the pipes which are designed to serve a population of 660,000 with an average daily supply of 25 gallons per head on the assumption that the whole supply comes directly from the single elevated tank at Kilpauk may, by means of subsidiary tanks, be made to supply a greater population with a larger quantity, say a population of 800,000, with 35 gallons per head per day."

The average supply, 25 gallons, will be exceeded on many days during the hottest part of the year, the excess draught allowed for under this head being 20 per cent. A higher figure is not taken because in the hottest weather many of the largest consumers are away from the city, in hill stations, and in Europe and elsewhere. Next, the allowance for the maximum flow during the day is based on the assumption that the rate during hours of great demand may be double the average for the day. Double 120 per cent of the mean for the *year* gives 2·4 times that mean. Further, allowing for fires and festivals, Mr. Madeley concludes that the pipe system should be designed with a capacity of 75 gallons per head per day.

While the minimum pressure allowed in some of the towns of the Madras Presidency is as low as 10 ft. head, the lowest head in Bombay is 50 ft., and the new works in Calcutta will ensure a head of 40 ft. For Madras, therefore, it is held that the lowest head of water should be 50 ft. "The pressure in some of the distributories will be less than this owing to the head required to force the water through pipes, but the loss of pressure will be reduced to a minimum owing to the interconnection of pipes which has been effected wherever possible."

The smallest new pipe proposed in the report is 4 in. in diameter, but it is proposed to leave in the existing 3-in. pipes where they are not too small to supply domestic requirements. It is believed that the provision of two kinds of house services will tend to reduce waste. The second-class service would be provided by taps, open to inspection without notice. The next few years will probably see a large extension of sanitary fittings in Madras [at present there are hardly any, even in the hotels], and for these lead pipes will be suitable. Experiments point to the probability that the Red Hills water has no solvent action on lead.

PREVENTION OF WASTE AND LEAKAGE.

In Bombay and Calcutta special staffs are engaged in the detection and prevention of waste. In Madras there are few factories, and it is unlikely that the consumption will be as great as in either of those two cities; but no precaution should be omitted to prevent waste. Intermittent supply is an evil, and should be regarded as only a temporary expedient. It leads to storage in vessels in the houses, to the inspiration of impurities, and danger from fire. Other and better means of preventing waste are: Limiting the number of house connections, metering every water service, house-to-house inspection, taking up and replacing all pipes and fittings, and the use of the waste-water meter system. These are dealt with seriatim in the report. As regards house-to-house inspection, it is costly, and depends for its efficiency on the honesty of comparatively low-paid inspectors. In Madras the caste system and gosha habits would seriously interfere with the work of inspection. The waste-water meter system is strongly recommended for Madras, and should be installed when the new pipes are laid. In Calcutta the use of this method of checking waste has led to a saving of nearly 23 per cent of the supply. The arrangement proposed for Madras is explained in the report and by means of a plan. The number of meters recommended is 120, of which 56 would be 4-in. meters, 58 6-in., and 6 8-in.

An important source of waste in Madras is that due to misuse of the public taps, and it is highly desirable that all fountains should be fitted with self-closing taps. Similar taps might be provided in the houses. "The importance of reducing the waste," writes Mr. Madeley, "cannot be exaggerated." There will be enough for every legitimate purpose if it is not wasted.

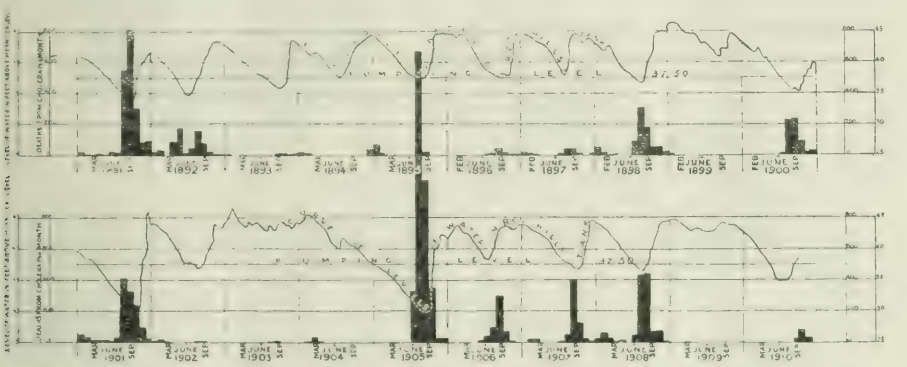


Fig. 2.—Madras Water Supply: Effect of Pumping from Red Hills Tank under Present Conditions.

DETAILS OF THE PROPOSED DISTRIBUTION SYSTEM.

The arrangement of the principal mains is shown in Fig. 3, which is prepared from a plan accompanying the report.

A primary main, 3,000 ft. long and 48 in. in diameter, will carry the water to the existing and new principal mains.

Main No. 1, which begins with a diameter of 42 in., and is reduced to 30 in., and finally to 6 in., is 35,162 ft. long.

Main No. 2, partly new and partly old, begins as an 18-in. branch off main No. 1, and diminishes gradually to 14 in. Its length is 17,692 ft.

Main No. 3 is an existing main, which will be connected with the 48-in. main, and end as a 10-in. pipe. The length is 17,559 ft.

Main No. 4 branches off No. 3, beginning with a diameter of 36 in. and being reduced to 14 in. Length, 14,770 ft.

Main No. 5 starts as a 22-in. pipe off No. 4, and ends as a 12-in. pipe, its total length being 15,688 ft.

Main No. 6, which is a part of the existing main, will branch off the new main No. 7. It is a 14-in. pipe, with a length of 17,250 ft.

Main No. 7 is a new main beginning as a 30-in. pipe, and will supply a large area. Its length will be 27,800 ft. In addition to these there will be ten branch mains, from 18 in. to 6 in. in diameter. Some of the principal quantities may be noted, the lengths of old pipes being the lengths to be retained in the scheme. These are the same as the lengths now in

use, except in the case of the 18-in. pipes. Most of the pipes of smaller sizes will be retained, down to 3-in.; all below 3 in. will be removed.

Diameter: inches.	Existing pipes.	New pipes.
48	—	3,230
42	4,200	13,759
36	3,750	6,110
33	—	300
30	1,300	14,795
27	11,750	11,975
24	4,160	3,700
22	3,700	—
21	8,650	—
20	2,170	5,610
18	18,000	9,495
16	3,295	3,755
15	300	—
14	24,325	3,160
12	23,360	12,750
10	26,280	8,300

Besides considerable lengths of the intervening sizes, the scheme includes the provision of 536,410 ft. of new 4-in. pipe, and 149,800 ft. of old pipes of the same diameter. The total length of old pipes to be removed will be 61 miles, to be retained 111 miles, and to be relaid 4 miles. New pipes to be laid, 132 miles; total length of pipes when the scheme is complete, 247 miles. In this connection the following figures are of interest. Total length of roads in Madras, 270 miles; length of roads where pipes will be laid, 232 miles. These lengths include unmetalled roads.

An important economy will be gained by the use of 24-in. valves on mains of 36 in. to 42 in.; 18-in. valves on mains from 24 in. to 33 in., and 12-in. valves on 12-in. to 22-in. mains. For instance, a 42-in. valve and pit would cost Rs.1,430 (£95), whereas a 24-in. valve and pit will cost Rs.630 (£42), a saving of Rs.800 apiece (£53).

At the head of each of the seven principal mains there will be a Venturi meter, with a counter and diagram recorder. At distances of about half a mile hatch boxes will be placed. As regards the pipe joints, Mr. Madeley has, after careful consideration, concluded that only socket and spigot joints run with lead should be used. The superiority of such joints over turned and bored pipe joints in the case of Madras will be partly on account of the large number of deviations and sharp bends that will be necessary, partly on account of the effects of settlement due to excavations, and partly because the turned and bored joints do not admit so readily of expansion and contraction taking place without injury to the joint.

Many hydrants will be provided, also 100 pillar fountains, 300 single wall tap fountains, and 200 double wall tap fountains.

UNFILTERED WATER.

It has only been possible to make a rough estimate of what the demand for unfiltered water would be. About 500,000 gallons a day might be used for sewer flushing, a somewhat larger quantity for industrial purposes, and about 250,000 gallons for road watering.

This amounts to about one-tenth of a full supply, and hardly justifies the laying of special mains. There are, however, three large consumers whose works are close together—the Buckingham Mill Company, the Carnatic Mill Company, and the Madras and Southern Mahratta Railway Company. As these companies find unfiltered water suitable for most of their purposes, it is proposed to devote an existing 16-in. main to the supply of such water, at any rate for a time.

THE ESTIMATES.

The estimated weight of spigot and socket straight pipes required is 16,747 tons, of which 42-in. pipes account for 3,581 tons, 30-in. for 2,197 tons, and 4-in. for 4,515 tons. The estimated cost, allowing for deviations from 2 to 4 per cent, is Rs.18,93,621 (£126,208). Socket and spigot bends account for Rs.14,903 (£994). Cast-iron tees for mains, Rs.33,592 (£2,239), and the estimates for other connections, taper pipes, and so on, bring up the total for cast-iron pipes and specials to Rs.30,30,000, or £202,000. The estimate for pumping machinery is Rs.3,90,000 (£26,000), for the elevated tank over Rs.3,20,000 (£21,333), and for the pumping station buildings Rs.1,63,350 (£10,890). The total of the estimates is Rs.42,08,960 (£280,597).

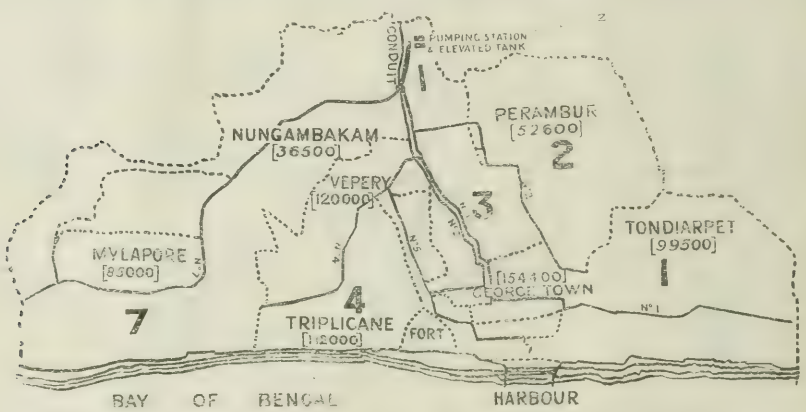

Fig. 3.—Madras Water Supply: Plan of Madras City, showing Leading Mains and the Areas Supplied by Them.

Note.—The boundaries shown are not those of the districts corresponding to the names on the plan, but are those of the areas served by the different mains.

Road Maintenance Charges.—The Finance Committee of Surrey County Council reported at the last meeting that they were of opinion that the only means of securing effective relief to county rate and tax payers from the heavy maintenance expenditure now necessitated by the traffic of road trains, motor wagons, traction engines and motor omnibuses, are a substantially increased revenue from motor owners, and an allocation to the Home Counties of a special share of the revenue derived from all classes of motor and steam vehicles proportionate to the increased cost entailed by this form of road traffic. The committee recommended that the council pass a resolution to the above effect, and that the same be sent to the Chancellor of the Exchequer, the county Members of Parliament, and the County Councils' Association. The motion was adopted.

University of Sheffield: Department of Architecture. We have received a prospectus of the Department of Architecture of the University of Sheffield. The next session will begin on October 2nd. The lecturer, Mr. W. S. Purchon, A.R.I.B.A., will be present at the University on September 30th and October 1st, from 9.30 to 12.30, to see intending students. The department provides: (1) A two years' day course; (2) an advanced course for diploma—part day, part evening; (3) an evening class in architectural drawing; (4) courses in surveying. A preliminary year course has been arranged to meet the requirements of the R.I.B.A. preliminary and the matriculation examinations. Students who obtain the first-class certificate (awarded at the end of the third year) are exempted by the Royal Institute from all but the final examination qualifying for A.R.I.B.A. Students who are unable to take a complete course may, by arrangement, attend any part or parts of the day or evening courses approved by the lecturer.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

Among the papers discussed at the recent annual meeting of the Institution of Municipal and County Engineers was the following:—

MAINTENANCE, FLUSHING, AND CLEANSING OF SEWERS IN HAMPSTEAD.

By Oliver E. Winter, assoc.m.inst.c.e., Borough Engineer and Surveyor, Hampstead.

From Photo. by Foster Brothers, Hampstead.

[Mr. Winter has held the appointment of borough engineer and surveyor of Hampstead since June, 1901. He entered the municipal service in his native city of Norwich, and received his professional training under Mr. I. F. Marsham, city engineer. He was afterwards appointed assistant and ultimately chief assistant under Mr. Marshall. He continued in this appointment at Norwich under Mr. John Buchan, assoc.m.inst.c.e., and Mr. Arthur E. Collins, m.inst.c.e. In 1894 he was appointed by the corporation acting city engineer and surveyor, carrying out these duties for several months. During the time Mr. Winter was at Norwich there was a large growth of the city, and he was actively engaged in extensive schemes in every branch of municipal engineering work. Since 1895 he has held chief appointments in London, in that year being selected as engineer and surveyor to the vestry of St. George the Martyr, Southwark. Here he initiated extensive drainage works, an important street improvement scheme around the Church of St. George the Martyr, and Long-lane in the Borough, which was adopted and carried out by the London County Council at a cost of about £200,000, and various building works. In 1898 he was appointed chief surveyor to the Poplar District Board of Works, and was reappointed as borough surveyor on the constitution of the borough councils in 1900. At Poplar he carried out several miles of new paving works; designed and erected the new generating station for the electricity works at a cost of about £20,000, a bridge over North London Railway, and various other extensive works, which were all carried out by direct administration, under his supervision. In 1901 he was appointed borough engineer and surveyor of Hampstead. Since then many important works have been designed and carried out by him. Among these may be mentioned a new works depot (cost £18,000), a housing scheme (£12,000), extensive drainage and paving works, underground conveniences, a branch library, a cemetery extension, improvements to public baths, and street improvements. Mr. Winter is an associate member of the Institution of Civil Engineers, and a member of the Institution of Municipal and County Engineers, of which body he was this year elected to the council as a district representative of the metropolitan area.]

The object of the author in submitting this short paper to the institution is to describe some special features of work recently carried out in the metropolitan borough of Hampstead, under his direction as borough engineer, in connection with the maintenance, cleansing and flushing of the sewers in the borough. Hampstead drains into the metropolitan drainage system, and there are about 4 miles of main trunk sewers under the control of the London County Council in the borough. There are 60 miles of sewers under the control of the borough council, of which 35 miles are brick and 25 miles are pipe sewers. The sewers take both sewage and storm water. The gradients are generally good throughout the borough, the surface varying between 100·1 and 441·3 above ordnance datum.

MAINTENANCE.

Many of the older brick sewers, constructed between forty and fifty years ago, have in recent years become defective, calling for considerable repair or reconstruction. The chief defects are generally in the invert—which has been mostly constructed in brickwork in cement blocks or cases. This has become worn, with settlements in places. The side walls and arch of sewer have been built of good hard bricks, but with wide joints, in lime, and often burnt ballast mortar. The brickwork has consequently become uneven, with rough surface, and impossible to keep in clean condition. The brick sewers are egg-shaped, the usual sizes being 3 ft. 9 in. by 2 ft. 3 in. and 3 ft. by 2 ft. In many cases these sewers are much larger than required, and where extensive repairs are required it is necessary to decide, first, as to the advisability of reducing the size of the sewer and reconstructing in a glazed stoneware pipe sewer of sufficient size so as to be self-cleansing, or of carrying out repairs and renewals to the old sewer, if material reduction in size is impracticable. A good and somewhat unusual example of the first method is a reconstruction which has been carried out to a 3-ft. by 2-ft. brick sewer, passing under the West Heath, including the "Leg of Mutton" pond, and draining the portion of the borough known as "North End." This sewer was constructed forty-seven years ago, and it is stated that considerable difficulties attended its construction, owing to the running sand and water. The side walls and arch in places were being pressed in, and water and sand were being forced through the rough joints of the brickwork by the outer pressure. There appeared to be serious risk of the collapse of the sewer. After careful consideration and experiment the author advised the construction of a 15-in. pipe sewer, within the old 3-ft. by 2-ft. brick sewer, and filling around the new pipe solidly with concrete. Although the space available for working in the old sewer was very confined, the work has been carried out and completed in a sound and watertight manner, working from the existing manholes, and the shafts for the new manholes it was desirable to construct. Otherwise, any further opening in the difficult ground was avoided.

The stoneware pipe adopted for the work was the grouted composite jointed pipe manufactured by Messrs. Doulton & Company. It was necessary that a joint should be used which could be easily and quickly made in running water, and thus avoid any diversion of the running sewage. On inserting the spigot into the socket, the composition rings (which are previously greased) at once form a sound joint. The attached canvas casing (or bag) allows the cement joint to be easily made. When the cement grout is poured into the canvas casing, any water within the casing is driven out through the canvas by the heavier grout, and a perfect cement joint is secured. In laying the new pipes it was desirable they should be laid to a true gradient between manholes. As the old sewer had settlements in places it required considerable care in fixing the new levels. This was done in the following manner: The level of the new invert was fixed at each manhole; 2-in. by ¾-in. wooden battens were fixed on each of the side walls, at the required level, by a boning line from manhole to manhole. Gauge is then worked from the under side of the batten to the invert of the pipe, and the pipe-layers can easily work to a true line, whatever the gradient may be. Periodically, when the flow of sewage was at the minimum, the sewage was dammed back, and a water test of 25 ft. to 35 ft. head was applied to lengths of pipes laid, varying from 20 ft. to 30 ft. These tests showed that the joints were quite watertight, notwithstanding that the pipes were laid in water varying from one-third to three-quarters the diameter of the pipe. After the test mentioned, the whole space between the pipes and the old brickwork was filled in with cement concrete. The length of sewer dealt with in this manner was 2,806 ft. The estimated cost of this work, including new manholes, abolishing two very objectionable stepped ramps, and constructing in iron pipes in the form of tumbling bays, amounted to £2,300. The actual cost of the work carried out by the council's staff has amounted to £2,234. A loan was obtained from the London County Council for this amount, to be repaid in twenty years. An excellent self-cleansing sewer has thus been obtained in substitution for a defective and offensive brick sewer, for about one-fourth the cost of the original sewer. The actual cost of the 15-in. pipe sewer work alone, including filling into the old

3-ft. by 2-ft. sewer, worked out at about 9s. 6d. per foot run, complete. The same method has been adopted with other defective brick sewers, the same jointed pipe being used in each case as last described, but of the diameter to meet the needs of each case. The following particulars may be given of these:—

Size of old sewer.	Diam. of new pipe.	Cost per foot run complete.
3 ft. 9 in. × 2 ft. 6 in.	9 in.	10s. 0d.
3 ft. 6 in. × 2 ft. 3 in.	12 in.	8s. 9d.

The following data may be useful in connection with this work:—

Fifteen-inch stoneware pipe in 3-ft. by 2-ft. sewer; one pipe-layer and three labourers laid and completed, including concrete filling, on an average 5 ft. per day.

Twelve-inch stoneware pipe in 3-ft. 6-in. by 2-ft. 3-in. sewer; one pipe-layer and three labourers laid and completed on an average 9 ft. per day.

Nine-inch stoneware pipe in 4-ft. by 2-ft. 8-in. sewer; one pipe-layer and three labourers laid and completed on an average 12½ ft. per day.

In cases of old brick sewers, where it has not been practicable to reduce to much extent the size of the sewer as last described, a different method must be adopted. As already stated, the chief defects to be remedied were in the invert. But the brick inverts are not generally so defective as to require entire under-pinning, nor the complete removal of the inner ring. To meet such cases, the author designed a reinforced concrete invert, to fit the existing invert of the sewer. The invert was made to the section shown on the drawing, 2 in. in thickness, and in lengths of 2 ft., with rebated joint. Of this size they could be readily handled and got into the sewer through the existing manholes or side-entrances. The inverts are made by the Imperial Stone Company of Tottenham, and usually stored three or four months to permit them to thoroughly harden before being sent to the works. The concrete inverts were bedded and jointed in cement mortar, and where any depressions existed in the old invert, or more regular falls could be obtained, on fine cement concrete. To firmly secure the inverts in position, over each joint a corbel, 4½ in. by 6 in. by 2¼ in., was pinned into the side walls of the sewer. A cement benching was formed on the top of the invert, enclosing the corbels, and making one finished continuous line. The inverts were lowered into the sewer in a rough frame to prevent damage, and placed on a specially made trolley, and conveyed to the point required. During the time the inverts were being fixed in position the sewer was dammed up, and the flow conducted along the side walls in galvanised iron troughs, arranged sufficiently low to receive the drainage from the house connections. Several thousand feet run of this invert has now been fixed in such old brick sewers as described, with very satisfactory results. The cost of the new invert, including bedding and laying complete, averages from 4s. to 4s. 2d. per foot run. This is a much lower cost than would have been incurred in cutting out 4½ in. of the defective brick invert, and renewing in brickwork. The sides and crown of the sewer were scraped and thoroughly washed, the joints of side walls raked out about 1½ in. deep, and filled in and repointed with cement and sand mortar (1 and 1). In a 3-ft. 9-in. by 2-ft. 3-in. sewer the cost of this work varied from 2s. to 3s. per foot run of sewer, according to the amount of defective brickwork requiring to be cut out and made good. The total cost, therefore, of putting these old sewers into a thoroughly good and sound state of repair did not exceed 6s. to 7s. per foot-run. Good, clean sanitary conditions have thus been obtained at a comparatively small expenditure. After these works have been completed there has been a very marked improvement in the air within the sewers, which cannot fail to have an important beneficial effect on the general sanitary condition of the neighbourhood.

Hampstead Sewers.

Flushing and Cleansing.

Regular and systematic flushing of sewers is of great importance, and absolutely necessary in keeping the sewers in a clean condition and free from nuisance. For this work in Hampstead the borough is divided into three districts, and six men are regularly engaged—two in each district. There are forty-two flushing tanks constructed underground, with a capacity of about 2,000 gallons, which are discharged at least once a week. Water is supplied through a meter from the Metropolitan Water Board's mains.

These tanks are arranged at such points that they can flush two, three, or more sewers—by means of flaps. The flushers who attend to their working also clean out the surface ventilators, and see that all gully gratings in their respective districts are free from obstruction, and report any defects. Flushing manholes are also arranged at the apices of other lengths of sewers, and are flushed out from time to time as circumstances require by a steam motor watering and flushing van of 1,000 gallons. This van has proved very efficient for the purpose. A gang of not less than three men traverse all the brick sewers for the purpose of removing any deposits. They also see that the flaps to house drains are working freely.

Where large brick sewers exist, and especially where such sewers are only at long intervals fully charged in times of exceptional rainfall, it is desirable that further cleansing should be carried out in addition to the regular flushing. The author's attention was called to this very forcibly in a report on sewer ventilation made to the Hampstead Borough Council in 1905 by Dr. F. W. Andrewes and Dr. W. H. Hurtley, after a careful examination of the older brick sewers. They state:—

"It is probable that much, if not all, of the smell arising from the ventilating grids depends not on emanations from the flowing sewage, but on decomposing organic matter and fungoid growths on the walls of the sewers, which are in some places in an exceedingly filthy condition. We were informed that when the men employed in the sewers had to work for any length of time in one place, they did, of their own accord, wash down the walls for some distance from where they were working, and that this expedient considerably reduced the offensiveness of the air. We therefore recommend that where nuisance arises from the sewer grids the walls of the whole sewer in question should be thoroughly washed and cleaned and finally rinsed over and otherwise treated with a disinfectant. Should it be found, on trial, that the nuisance can thus be abated, the cleansing should be carried out as far as possible throughout the district, attention being especially paid to the older brick sewers."

For the purpose of thoroughly cleansing brick sewers, the author has devised an arrangement of a portable meter with hose pipes. The portable meter is attached to a street hydrant, and a 2½-in. hose pipe is conducted from the meter to a side entrance or manhole. An attachment is fitted at the end of the 2½-in. hose pipe, with two valves and smaller hose pipes, each controlled separately, and arranged so as to work up or down the sewer. Four men are employed in the sewer, two at each end of the smaller hose pipe, one spraying the water on the walls, the other scrubbing with a bass and steel brush. Two men are required on the surface or near the entrances to manipulate or guard the hose pipes. The Water Board insist upon having a waterman in attendance while the meter is working, and a charge of 6d. per hour is made. The cost of such cleansing, including water and labour, works out at about 1½d. per foot-run for a 3-ft. 9-in. by 2-ft. 6-in. brick sewer. There has been a very marked improvement in the air of a sewer after this cleansing has been carried out, and there can be no doubt as to the desirability, from a sanitary point of view, of such cleansing from time to time, as occasion requires.

The work described in this brief paper is not so striking or sensational in character compared with other work carried out by a municipal engineer, and it is almost entirely hidden from the public eye. Such work may add little or nothing, for the moment, to the reputation or credit of the official responsible for advising thereon, and carrying out the work in a sound and satisfactory manner. But in conscientiously and energetically discharging his important duties in connection with the maintenance of the drainage system under his control in a clean and sanitary condition, he very quickly sees substantial beneficial results accruing to the public he serves.

DISCUSSION OF MR. WINTER'S PAPER.

Mr. E. J. Silcock (Westminster and Leeds), in proposing a vote of thanks to Mr. Winter for his paper, called attention to the particular value of the contribution in giving information as to the life of the sewers, a matter which frequently turned up with regard to the length of the term for which loans should be granted for the construction of works. The length of a loan period must naturally be regulated by the life of the works. Thirty years, which was the maximum term allowed by the Local Government Board, seemed all too short for works such as sewers, which undoubtedly, if well constructed, had a much longer life than thirty years. They had in this paper a record of sewers constructed forty or fifty years ago, and reading between the lines they thought they would infer that the sewers, as first constructed, were not made of the highest class of materials, or with the best class of workmanship. Being in the London district, they might assume that the bricks would not be so good as Staffordshire blues, or the bricks which could be obtained in many districts to-day. The joints also were of inferior material to those of to-day. Under these circumstances it would seem that the life of the sewers of Hampstead was considerably over thirty years, and now they had a chance of their life being considerably extended. With regard to the system adopted by Mr. Winter of putting a pipe sewer inside a brick sewer, it could not be adopted often on account of consideration of the size and carrying capacity of the sewer. The sewers in this case were considerably larger when constructed than was necessary, but, even so, the placing of a 15-in. pipe sewer inside a 3-ft. 9-in. brick sewer must have required a special type of man—smaller than the ordinary navvy. This applied particularly to the work of concreting round the pipe. The author told them that the work was done in lengths of 20 ft. or 30 ft.; certainly there could not have been very much room for a man to get in to work. The system of jointing for stoneware pipes was one of which he had had considerable experience, and he wished to confirm the statement that it was a very satisfactory method of jointing pipes when water was running during the time the joint was being made. The test applied to the pipes seemed to be unnecessarily severe, and he doubted whether under ordinary working conditions it would be necessary to put such high pressure on the inside of the pipes.

Mr. E. J. Elford (Southend-on-Sea), seconding the vote of thanks, said he did not quite understand how the concrete inverts were reinforced, nor could he see the value of reinforcement, having regard to the conditions under which they were used. Mr. Winter referred to the tanks for flushing the sewers, and it would be interesting if he could give them some figures as to the cost of these fixed flushing tanks as compared with movable tanks. The capital cost of the fixed tanks must be a considerable item.

Mr. J. S. Brodie (Blackpool) said the paper would have been still more interesting if Mr. Winter had given them in a little more detail the defects he found in these brick sewers. He took it that the chief defects would be the interior mortar joints and brick settlements. It was always interesting when they had to substitute new sewers for old ones to know in what respect the old had failed, and then they could tabulate the information. One peculiar thing was the unusually large size of the old sewers as compared with the new one. There seemed a large reduction in the area, and therefore in the carrying capacity, of the sewer, and either the old sewer must have been too large or the new one must be rather too small. With regard to flushing tanks, he did not think there was much to be said against them; the only question was the quantity of water required to make them really effective. It was not every town that was so well off as Blackpool, for they had both a fair supply of fresh water and an unlimited supply of salt water. The length of time allowed for repayment of loans in regard to sewers had been alluded to. There seemed to be a feeling that sewers once put down were there for ever. But those who were in charge of these matters knew that was not so. The time came when even the best work showed defects and had to be made good. The loan period should not be a very long one—that is to say, it should not be calculated on the probable length of life of the work, but rather on the convenience of the authority with regard to the repayment of the loan. He had known some cases of sewage work where the enormous period of sixty years was granted. He thought that was far too long, and if it were cut down to one-half, or even a shorter period, it would do away with the temptation to local authorities to go in for enormous capital expenditure because the annual payments were so small.

Mr. E. Willis (Chiswick) added his thanks to Mr. Winter for his practical paper. While he was assistant engineer at Willesden there was one case of a similar character. The particular sewer was subjected to heavy pressure from traffic at the time of the Great Exhibition, and did not stand it as it should have done. They found that, instead of

the inverts going, the haunches were pushed in. He went through the sewer, and found it was about 1 ft. 4 in. in width in places, and that in some cases the road was resting on an open cavity owing to the haunch being pushed in. It was cut out in short sections, and, although it was only a 3-ft. by 2-ft. sewer, it was repaired by a man over 6 ft. in height. Fortunately there was not a big flow of sewage along it. The work was perfectly done; the only thing was it took a good deal of time, but he did not think the expense came out quite so much as in Mr. Winter's case. He had just left a similar piece of work where the sewer was constructed prior to 1861. He had had it under observation, and had seen signs of trouble. About a fortnight ago he went there and found a cavity had formed 6 ft. 9 in. by 4ft. 6 in. by 8 ft. deep. He could not get the council to undertake remaking entirely, but by careful observation he was able to prevent any accident. These were difficulties which he feared Mr. Winter's process would not overcome. It occurred to him that, as space was limited, he might have concreted 30-ft. lengths, and he asked Mr. Winter if it was possible for a man to joint up as he carried the pipes along. When he had had somewhat similar works he had always had the jointing done as they progressed, and by that means he had been able to give the men a fair amount of room to work in, and never had any trouble on that score. He had used the same joint as Mr. Winter with marked success. He thought, on the whole, the cost was not excessive, and Mr. Winter was to be complimented on the length he was able to keep going every day.

Mr. S. E. Burgess (Middlesbrough) inquired what provision was made for rainfall in these small sewers. Was it one-third or one-quarter of an inch per hour?

Mr. E. R. Matthews (Bridlington) asked whether in this first section of the brick sewer Mr. Winter did not find great difficulty in connecting the house drains. As regarded the bottom section and the reinforced concrete invert, he did not see the need for reinforced concrete in that position. He thought ordinary cement would have been quite sufficient. With regard to automatic flushing tanks, he had fourteen tanks going at Bridlington, and had experienced no difficulty with them. So far as the Water Committee were concerned, they relied entirely on the figures he gave them of the number of gallons used yearly in the tanks. They paid for the water used 6d. per 1,000 gallons, and the committee encouraged them to use the tanks as much as possible. At the height of the season they let the tanks go off twice a day on three days each week, and they found that very effective.

Mr. W. Harpur (Cardiff) said he had numerous flushing tanks at work—if he said 100 he would not be far wrong. There was a water meter attached to each tank, so there was no difficulty about measuring the quantity of water used. They could turn on the supply at any time it was desirable to do so, as fast as they needed it and as often as he thought necessary, and he found the tanks did an immense amount of good used in that way. They had not experienced the slightest trouble with them.

The President, in closing the discussion, remarked that it was from the results of wear and the actual conditions of old work that they learned very largely what to avoid and what to continue doing. The more they got from experience in actual working the better they would be enabled to carry out work in the future.

The vote of thanks was passed.

Mr. Winter expressed his thanks to those who had taken part in the discussion. As to the precise condition of the old brick sewer, as he had said, the bricks were of fairly good and sound quality. The defects were mainly in the jointing, very inferior mortar having been used. The chief defects were in the invert, where the joints were open, making them receptacles for filth, and they had settled in places, so it was a question of putting in a new invert of blue brick or dealing with it on the lines described in the paper. If he had adopted blue brick the invert would have been improved, but the cost would have been increased, and the general result would not have been so good as that he had obtained. With regard to laying the 15-in. pipe in the sewer, perhaps he had not made it sufficiently clear that two or three pipes were laid at a time and concreted as the testing was carried out. It would, of course, have been impossible to make the concrete good except as the pipes were laid. The reinforcement was of a slight character, stout steel wires placed in sections in the moulds as the concrete was manufactured. He thought the reinforcement was useful. The thickness was only 2 in., and the extra cost was small. He had no exact figures as to the comparative cost of flushing by motor vans and by tanks, but he was pleased with the result obtained from the tanks. The payment for water in London for this purpose was 6d. per 1,000 gallons. The connection of house drains where the pipe sewer was put into the brick sewer added to the cost, but they had no difficulty in the work.

(To be continued.)

ROAD MAINTENANCE IN WARWICKSHIRE.

COUNTY SURVEYOR'S ANNUAL REPORT.

In his report for the year 1911-12, Mr. John Willmot, county surveyor of Warwickshire, states that the total expenditure on roads directly maintained by the county council during that period has been £52,124. The full rate per mile for ordinary expenditure was £111·25, but, deducting the grant of £7,050 received from the Road Board, the figure is reduced to £100·6 per mile.

The length of roads remains at 457½ miles.

The average number of men employed full time on the roads was 202, the highest number employed during any one fortnight being 230, and the lowest 173. These figures have not been equalled in any previous year.

The cost of materials, including stone breaking, was £20,960, which is equal to about 41 per cent of the total cost of ordinary maintenance. The quantity of granite and other hard stone purchased, exclusive of pebbles, was 36,262 tons, the cost of which, including breaking, was £14,608, giving an average price of 8s. 1d. per ton. Slag and rubble, chiefly used for strengthening the foundation of the roads, amounted to 17,488 and 515 tons respectively, the average price of the former being 4s. 9½d., and that of the latter 3s. 5d. per ton. Over 300 tons of tarred material were used for patching purposes.

The quantity of stone and slag consolidated by the council's seven steam rollers was 37,918 tons, giving an average of 23 tons per day for each roller. Some 12,367 tons of material were consolidated by hired rollers, the average reached by each roller per day being the same as with the council's rollers.

A total area of 490,500 sq. yds. of road were remetalled during the year, the length dealt with being nearly 54 miles, and the average thickness of coating applied, including slag and rubble, of an average of 3·4 in. Surface tarring cost £3,926. The Taroads Syndicate covered 606,752 sq. yds., at a cost of £3,722, and the council 35,008 sq. yds., at an outlay of £204.

The work done by the Taroads Syndicate and the council's own men cost 1·47d. and 1·40d. per super. yard respectively. The total number of gallons of tar used was 124,986, and the area treated 641,760 super. yds. This gives an average of 1 gallon of tar to each 5·13 super. yds. of road. The work was principally carried out during May and June, and, for the most part, in very favourable weather. The result has, on the whole, been quite satisfactory, and has undoubtedly prolonged the life of the roads in many cases, and conduced to the comfort of the public.

Modern Traffic Conditions.—In a report presented at the last meeting of the Surrey County Council, the county surveyor, Mr. A. Dryland, reviewing the work of the past year, stated that the nett cost of the main roads would be about £80,410, an increase of only £24 upon the estimate. The annual census of traffic showed an increase of about 11½ per cent in self-propelled vehicles and a decrease of about 4 per cent in horse-drawn vehicles. Mr. Dryland added: "We are all impressed with the large cost of roads at the present day compared with the past, but relative cost can only be judged by a comparison of expenditure in conjunction with the work accomplished, which in the case of roads means traffic carried. It is unfortunate for that purpose that we have no records except in quite recent years. Were statistics available over a long period I think it is quite probable that the cost has only kept pace with increased use, and with the better surfaces of to-day it is quite possible that per ton per mile the traffic is now being carried at a cheaper rate than in the past when the expenditure on maintenance was very much less."

ARTIFICIAL SURF BATHS.

A MINIATURE INDOOR OCEAN.

Probably no feature of the International Hygiene Exposition held in Dresden last year attracted more general attention than the Undosa surf bath. During the five months of its operation it was visited by nearly half a million persons, and earned about £6,000, which more than covered the cost of construction (£4,000) and the operating expenses (about £1,400). Half this construction cost, however, was due to the contribution of many parts of the equipment by exhibitors, and the site cost nothing. The receipts from the sale of bath tickets, and especially of spectators' tickets, amounted sometimes to £90 in a single day, while the cost of operation was only about £8 per day. The additional outlay for the wave-producing apparatus is said not to exceed £1,400.

The mechanical device by which the waves are produced is very simple in principle. It consists essentially of one or more hollow wedge-shaped bodies made of sheet iron, which are rythmically immersed in and drawn out of the water by appropriate machinery. In situations in which the vertical elevation and depression of the wedges present difficulties the waves may be generated by oscillating vanes, but the operation is always so conducted that the water which rushes in to fill the void produced by the elevation of the wedge or the retraction of the vane passes the point of equilibrium and is heaped up by the return swing of the vane or the immersion of the wedge. The wave-forming action, therefore, is identical in principle with that of a stone thrown into a pond. If the stone falls close to the bank, so that the water can escape in only one direction, the height of the resultant waves is increased.

In designing the artificial surf bath at the Dresden Exposition, steam was chosen as the motive power, in order that the water of the bath (which was constructed by Herr Recknagel) and the air of the bath-house might be heated by the exhaust steam, for the purpose a locomotive boiler of 100-horse power being installed in the bath-house.

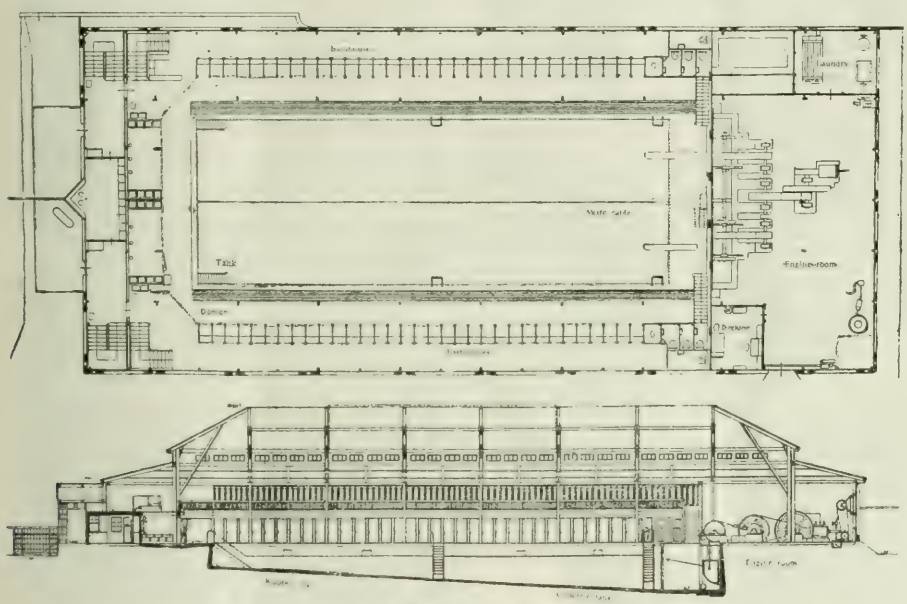
The wave-generating plungers were suspended from cranks attached to a shaft extending across one end of the swimming tank, which was about 40 ft. wide and 115 ft. long. This shaft could be connected by belt wheels and clutches near its ends, with a counter-shaft, at the middle of which was a wheel driven by a belt from the engine shaft. The gearing was constructed to immerse the plungers eighteen times per minute when the engine was running at its normal rate of 125 revolutions per minute. The bottom of the basin was inclined in the usual manner, and the plungers were placed at its lower end, where the depth of water was about 7 ft. The waves generated at this end of the basin were more than 3 ft. in height, and as they moved toward the other end and reached a point where the depth of water was less than their height they began to comb and break, and thus produced a very good imitation of the surf of a natural sea beach.

The arrangement of the plungers or vanes, and the character of the impulse impressed upon the water, can be varied in divers ways. Where space is limited, for example, a plunger could be attached directly to the piston-rod of a vertical engine placed above it, as in one form of steam-hammer. Plungers could be operated in the middle of a long basin so as to send waves towards both ends. The two parts of such a basin, divided by the machinery and a screen, could be used as separate baths for men and for women.

The height of the waves is conditioned by the volume of water displaced, and it can be varied within wide limits by varying either the travel of the plungers or the depth of water. For artificial basins the best practical method consists in varying the travel and distributing several plungers across the deep end of the basin. With three plungers constructed to be operated separately a great diversity of wave motion can be produced by using one plunger, two, or all three. If the three plungers, properly distributed, are operated together and synchronously, the whole basin is filled with regular waves of uniform height; while if even one plunger remains idle, the waves generated by the others spread into the calm water in front of it, and thus lose force and height as they approach the farther end. By accelerating or retarding individual plungers it is possible, as observation has shown, to produce a very complex wave pattern resembling that of the open sea.

Practically all of the conditions presented by a natural beach can be reproduced by doing away with the vertical wall at the shallow end of the basin and extending the inclined floor well beyond the water line. The difficult art of swimming in rough water can be practised at one end of the basin, while at the other end bathers can enjoy the breakers, the outrunners of which furnish safe amusement for small children. All of these persons may derive benefit from the massage effected by the moving water.

The diagram and description (abbreviated) are taken from *Scientific American* of July 27th last.



The Undosa Surf Bath.

(The upper diagram shows the plan of the building, comprising dressing rooms for men and women, bath 40 ft. by 115 ft., laundry, engine room, superintendent's office and wire rope. In the longitudinal section is shown a canvas roof, which is opened by rolling up.)

Royal Sanitary Institute Congress at York.

THE CONFERENCE OF ENGINEERS AND SURVEYORS.

At the conference of municipal engineers and surveyors held in connection with the recent annual congress of the Royal Sanitary Institute at York, the following paper was submitted for consideration:—

HOUSING AND TOWN PLANNING PROGRESS.

By H. Gilbert Whyatt, Assoc.M.Inst.C.E.,
Borough Engineer and Surveyor, Grimsby.

The Housing, Town Planning, &c., Act, 1909, received the Royal Assent on December 3, 1909, and has now been in force 2½ years; but not until the Local Government Board published their code of Regulations under the Act, on May 3, 1910, could any progress be made.

The Regulations at first reading appeared to be unnecessarily complicated, and seemed to require in the earlier stages a large amount of work which might with some advantage be postponed to a later stage; they also made no provision for the case where the local authority prepared the scheme and the landowner was in entire agreement with the proposals and needed no compulsion in the matter. The Regulations, however, included one to the effect that the Local Government Board might suspend any of their requirements, and the test of time has shown that the Regulations are not so unworkable and formidable as they at first sight appeared to be. A White Paper was laid before the House of Commons in November, 1911, showing the then position of town planning in seventy towns, urban or rural districts, and the present writer has been favoured with a letter from the Comptroller of the Housing and Town Planning department of the Local Government Board, showing the further advance from the date of that Memorandum to the end of May. The following shows what further progress has been made:—

	Schemes finally made and submitted.		
	At Nov. 1, 1911.	At May 31, 1912	At July 31, 1912.
Authority given for the preparation of schemes	8 schemes by 7 local authorities	14 schemes by 11 local authorities	14 schemes by 12 local authorities
Applications for authority	2	7 schemes by 6 local authorities	7 schemes by 6 local authorities
Local authorities which have taken the first steps and have served the necessary notices	11	13	13
Authorities which have schemes under consideration	22	31	32
Authorities which are in touch with the Local Government Board in the matter	28	36	44

Since the promulgation of the Regulations under the Act in May, 1910, many conferences have been held and many papers have been read before various learned societies and professional associations; the present writer has been privileged to attend several of them, and the outstanding feature has been the remarkable difference in local circumstances. The area to be dealt with may be purely agricultural land worth £50 or less per acre, or it may be ripe for building purposes and worth £500 per acre before the roads are made, and from £800 to £1 250 per acre afterwards, or at any intervening price. The area may be one where the roads are already arranged or even partly constructed, the scheme being required to preserve the amenities of the district and prevent the erection of factories alongside already occupied villas; or it may be one where the roads are not constructed nor even set out, and the landowner unable to deal with the financial part of the work without outside assistance. The area may be one where the landowner is willing to have the number of houses limited to eight, or ten, or twelve per acre; or it may be one where the lower working class is to be housed at a rental of 4s. or 5s. per week, and the number of houses per acre has to be fixed by considering the builder, his outlay, and leave the margin required by the landlord to cover ground rent and road making. It is seldom that small houses must be allowed, otherwise two or three families will inevitably arrange to occupy one house, and the interior of the house will be a slum, while the exterior is everything that could be desired in a garden city.)

From the point of view of a local authority (which includes the departments of the medical officer of health and the surveyor), as well as that of the ratepayer, town planning is in theory the only thing; there is no alternative. But if, after laying down a scheme, the land is not taken by builders and covered with model houses the landowner is injured, and houses are erected on other estates with less salubrious surroundings, all the labour expended in preparing the scheme being thrown away. From the point of view of the builder, the investor, and the landowner, the whole question is one of finance, and for any great progress to be made the question of finance must be carefully considered.

Where land is worth £50 per acre, a ground rent of less than 1d. per yard per annum will cover both the value of the land and the cost of street making; and at this there is no difficulty either in keeping the number of houses per acre down to ten or twelve, or in providing a decent sized piece of land even for the smallest type of house. Where land is worth £500 or more per acre the ground rent will need to exceed 2d. per yard per annum to cover both the value of the land and the cost of street making on Model By-law lines. Therefore, to bring the estate within reach of the working man, either a larger number of houses per acre must be allowed or there must be some relaxation of the Model By-laws as to streets and buildings, a power which is specially provided by sec. 55 in conjunction with the fourth schedule of the Act. At any intermediate price between £50 and £500 per acre, the problem varies in ratio to the price plus the cost of street-making. It is for local authorities, when preparing town planning schemes, to consider what relaxations they can consent to in return for healthier surroundings and amenities.

First, then, with regard to streets. The Model By-laws generally prescribe that a street shall be 33 ft., 36 ft., 40 ft., or even 50 ft. in width under certain conditions, that the streets shall be properly sewered, made, kerbed, channelled, and flagged; the cost of which works out at from £2 to £3 per foot run, according to width and nature of materials. It was suggested at the Town Planning Conference held in London on April 24th last to divide the streets into two classes, according to traffic: (*a*) to construct main roads from 70 to 100 ft. in width, arranged and constructed to take all the traffic ever likely to come over them; and (*b*) to arrange the secondary roads so as to discourage or prohibit "through" traffic, to be only available for access to houses, and to be constructed accordingly very much narrower in width, less substantial in construction, and possibly not provided with either kerbs or channels, the footpaths being provided with only one row of flags instead of being flagged the whole of their width. In the discussion which follows this paper it is desired to elicit opinions on the foregoing suggestion, and as to what is the minimum construction that should be allowed; also the liabilities that may devolve upon future generations of ratepayers if any portions of the street (kerbs, channels, or footpaths) are not now constructed.

Secondly, with regard to buildings. The Model By-laws with regard to buildings are not very onerous, except with regard to brickwork; and this is not so much in London as it is in the Northern and Midland counties, where bricks are so much better in quality than in the Metropolis. The carrying of party walls through the roof is quite unnecessary for two-storeyed houses; a 9-in. wall might be allowed 30 ft. or 32 ft. high instead of only 25 ft.; the 18-in. open channel between the slopstone pipe and the gulley might be dispensed with; but with the exception of these there is not much to complain of, and it is difficult to see what relaxations can be allowed in the Model code. It is certain that the erection of small houses as detached or semi-detached villas adds to the cost in many ways, there is an extra gable wall,

with its foundations and slating; an extra footpath alongside the gable; an extra length of front and back and party fence, and other items. On this point it is desired also to elicit opinions as to what economies in building may be made and what relaxation of by-laws should be allowed.

It may be pointed out that if there are no relaxations of by-laws, and if landowners will agree to lay out their estates on town planning lines, providing wider streets for "through" traffic, and allocating a portion of the estate for park or recreation ground purposes (either by gift or sale to the local authority), there will be no need to lay the scheme before the Local Government Board, and many valuable months will be saved, in addition to an enormous amount of office work.

Finally, it must be remembered that the dreams of the idealist must be transmuted by the alchemy of common sense into something practical before they can serve as a basis for town planning and the laying out of garden cities.

DISCUSSION OF MR. WHYATT'S PAPER.

Mr. F. W. Spurr (York), in a communication on the subject of the paper, said he had found that Mr. Whyatt had touched on a subject which must concern every surveyor and municipal authority exercising the powers of the Town Planning Act. For that reason the paper before the conference must be very valuable. He felt quite sure that economies could be brought about in street construction, varying in amount with the particular form of construction now adopted. In York the method of private street construction consisted of laying the footways with 3-in. Yorkshire flags, 12-in. by 8-in. kerb-paved channels, 14 in. wide, while the carriageway was constructed of either 9-in. stone pitching or 6-in. concrete finished with 3-in. tar-macadam the full width between channels. By adopting the following method of construction a saving of about 30 per cent could be made, and he might say the corporation agreed to that amended method of construction, provided the width of the street was not less than 42 ft. and the distance between the houses themselves 62 ft. Footways were constructed of tar paving composed of limestone chippings in place of 3-in. Yorkshire flags, 10-in. by 3-in. kerb in place of 12-in. by 8-in., channels 8 in. wide in place of 14-in. channels. With regard to the carriageways in residential streets, he did not advocate any alteration in the form of construction beyond reducing their width to about 16 ft., the remaining width being grassed and planted. With regard to economies in cottage construction, he did not think much could be done in York unless some other form of construction were adopted, but there could be no doubt that to build at the least possible cost, cottages must be erected in blocks of not less than six. Some saving in cost could be effected where by-laws provided for carrying the party walls through the roof, a precaution which he thought was unnecessary, and something might also be saved by an alteration in the thickness of walls for two-storey cottages, as suggested by the author.

Mr. T. Moulding (Exeter) said that, generally, he quite agreed with Mr. Spurr's observations. The standard in Exeter was not as high as that of York in the matter of building construction. In certain streets where there was not much traffic they allowed gravel footpaths. They were rolled and tar painted, and lasted a considerable time, besides which they were cheap to renovate. In the carriageway it would be a good thing if they could get landowners to put 6 in. of concrete, having regard to future upkeep, but it was rather a great deal to expect. They accepted the roads with the ordinary foundations. He thought that the cost of houses could be cheapened if the outbuildings could be built as suggested by Mr. Whyatt, and in Exeter the by-laws with regard to that matter were modified.

Mr. E. R. Matthews (Bridlington) said he quite agreed with Mr. Whyatt that local circumstances differed so considerably that what might be effectual in one would be impossible in another district. His own district was a residential one, and he had been contemplating how it differed from, say, a manufacturing city, where the town planning area was a purely industrial one. Therefore it was incumbent on surveyors to make the best of the district each had to deal with, and not be guided too much by what was being done in other towns. He did not agree that because a house was occupied by two or three families the interior was a slum. At Doncaster quite recently a housing scheme was submitted to the Local Government Board, and at the inquiry it was elicited that the tenants for whom the houses were intended had previously been paying 3s. and 3s. 6d. weekly. On it being stated that the rents which it was proposed to charge for the new buildings was 5s., the inspector said he could not recommend the board to approve that, and that fresh plans must be drawn up for houses to be let in tenements to two families at rents of 3s. a week. He saw no reason why persons inhabiting half a house should not be inclined to keep it in as sanitary a condition as if he occupied the whole house. He certainly thought that in town planning schemes any roads which were not "through" roads might be of somewhat less width than others—say, 30 ft. He did not agree with a suggestion made at the Manchester town planning conference that such thoroughfares might be of light construction, for there was always the risk of heavy traffic going on to them.

Mr. J. S. Munce (Belfast) said at every congress of the Royal Sanitary Institute that he had attended he tried to convince English engineers of the superiority of Irish practice in regard to the acquisition of land for building purposes. In Ireland they took the land on lease, and did not buy it outright, the period of the lease being up to as long as 9,999 years, less one day. (Laughter.) Land was taken over and laid out, and afterwards leased at a rent varying from 3s. to 4s. per foot frontage to the street, and as the houses were from about 13-ft. frontage the ground rent varied from 39s. to 52s. per annum. When the land was covered with houses the ground rents were sold at from 14 or 15 to as many as 20 years' purchase. Instead of grass plots along a street, it was, in his opinion, far better to provide open spaces. He was more convinced the longer he lived that the best thing to do was to spread out a town and bring the people into the centre to the factories by tramcars, even if they were obliged to run the tramcars free.

Mr. R. W. Cass (Farnham) said he considered there were many illusions with regard to housing, and one of these was that houses, great or small, should always front on a street. He did not think that was essential, particularly in the case of cottages, for it resulted in houses being placed back to back, and enormously increased the cost of roads. He had a plan for the erection of twenty houses on two acres of ground, and he found by making a very short street and a little square the cost would be greatly reduced. It was a mistake to crowd houses on a frontage; rather scatter them about and turn them to the sun as much as possible, and the result, he was certain, would be a much more economical and healthy plan. With regard to roads, he admitted that the carriageways should be decently made, but he had been impressed with the waste in the matter of kerbs. He knew of streets in suburban districts where nothing heavier than a furniture van went down in which 10-in. by 12-in. kerbs were laid, and, taken from an æsthetic or municipal engineering point of view, he contended that this was altogether uncalled for.

Mr. Munce said he would like to add that his view was that £150 for a working man's house was absurd. They could build a first-class house for £100 if they went the right way to work.

Mr. Whyatt, in replying upon the discussion, said it might be possible to build a house for £100 in Ireland, but not in England. The smallest house of which he knew—with two rooms up and two rooms down—could not be built for much under £140 here, and if they arranged for three rooms upstairs, as was certainly necessary, the cost would be between £160 and £170 at least. Personally, he was rather inclined to think that a 3-ft. strip between the road paving and the footpath was a mistake, as coal and milk carts would draw on to it, and in the course of a few years it would become an ugly, grassless strip, and a nuisance to everyone; moreover, it would have to be made up at the expense of the ratepayers instead of the estate owner. He agreed with Mr. Cass that it was not necessary for every cottage to face a street, but if they were going to build cottages in pairs, or singly, the cost of the gable walls and the extra fencing had to be added, and the capital cost was increased. With regard to Mr. Matthews' remarks, it was true that in theory the occupation of a single house by two or three families did not make it a slum, but he knew that in practice the tendency was in that direction.

ENGINEERING AND ARCHITECTURE SECTION.

Mr. J. Walker Smith, M.Inst.C.E., chief engineering inspector, Local Government Board, Scotland, occupied the chair in the Engineering and Architecture Section of the congress, and at the opening sitting delivered the following

PRESIDENTIAL ADDRESS.

In many of their works the respective provinces of the engineer and the architect are clearly defined and well separated; in many respects they are tangential and in some they overlap, or at least have their interests so interwoven that it becomes highly desirable that they should co-operate upon lines and in circumstances of mutual agreement and understanding. In affairs of the last class there falls one of the greatest importance in the work that arises from the operation of the Housing and Town Planning Act of 1909. I do not know of any sphere where co-operation of the two great professions can be more profitably effected, and where the results of such co-operation will yield greater beneficial results.

It must have been a source of satisfaction to all who have at heart the advancement of the science and art of city development that the British Government should have appointed a commission of engineers and architects to co-operate and collaborate in planning the city of Delhi. This is an example which I feel may, with very great profit and advantage, form a precedent for the future.

This work of town planning, of which we have such excellent examples in our country, and the absence of which, too, is exemplified in many deplorable instances, will need and will receive careful consideration from those of the engineering and architectural professions who feel drawn to specialise upon it.

THE WORK OF MUNICIPAL ENGINEERS.

In many cases the lines of town development will, as has been the practice in the past, rest with the estate owners and the municipal engineer and surveyor. No one has a greater appreciation than I of the qualifications, the assiduity and the earnestness of the municipal engineer. He has, with the limited powers and resources at his disposal, done most excellent work, and striven strenuously in the past in the interests of satisfactory and creditable town development. No one appreciates better than I the enormous scope of his duties, and the great amount of routine and administrative work which falls to his lot. The municipal engineer will continue his good work, and will ever remain an active figure in determining the lines of development of his district; but I feel satisfied that no engineers and architects need thereby be deterred from specialising in this work, for if they, untrammelled by much important routine and administrative work, are capable of assisting in the great work of town development upon lines of amenity, convenience, and improvement in the sanitary conditions, the broad-mindedness and public spirit of the municipal engineer will lead him to gladly accept and welcome such co-operation. I therefore look forward to considerable development in this direction, wherein the engineer and architect will play an important part.

There is already great public interest in the question of housing and town planning, and it is a little surprising that it is not even greater, for it should form common ground and a common interest for so many. . . . Better housing conditions, which will bring in its train a brighter home life and a better standard of life, is a step in the direction in which all desire to move who have at heart the improvement in the condition of mankind.

The movement beneficially affects both the well-to-do and those less favoured by fortune. The well-to-do are perhaps sufficiently housed themselves, but town planning will affect them, as it will provide for a town development upon lines that make for improved sanitary conditions and amenity, and will induce the wealthy and prosperous citizen to reside in his town, to take his share in the assessments, in the management, charities, social work, and administration of his town. A community often suffers much from the exodus of its prosperous and capable citizens, of whose assistance and support it is thus in great measure bereft. The thrifty and fairly paid workman in regular employment will appreciate better housing and a better standard of life. The thriftless, but well-paid (and there are many such), who does not appreciate the idea of improved housing and of a higher standard of life must be educated to appreciate and *demand* the better housing and better conditions of life for which he can already afford to pay. Then follows the class, all too large, whom it is difficult efficiently to house. It includes those whose employment is casual, whose wages are small, whose physique is indifferent or bad, whose mental and moral condition leaves much to be desired.

This class may need careful selecting and segregation, as one solution will not be found for conditions which are so complex and so difficult to fully appreciate as those which govern this problem. It is possible that some may be trained and fitted for some other sphere of life, where better opportunities await them; others, again, on account of some mental or physical defect, may never be able to fight their own battle in life, and will need consideration upon special lines. But most of them will be required, and must remain where they are, in the centres of industry, and should therefore be provided with better housing conditions (and be educated to an appreciation of them), where they may lead a brighter life, and where they may bring up happier and healthier children. So far—and it is considerable—as engineers and architects are able to assist in the solution of this great and complex problem, they will use their skill in a good cause and earn the gratitude of all right thinking men.

I am a little afraid that in discussing, even so generally as I have, this question of housing and town planning, I may have encroached upon the province of some other section of this conference. But I am satisfied that in this work there is room for the manifest and active interest of all; all may take a hand in this great movement; and to none can we look for greater assistance in the satisfactory town planning of cities and the efficient housing of all classes than to those who are drawn to this section of the conference.

RURAL HOUSING.

We shall come face to face with the housing aspect of this problem in the set subject for discussion of our section—*viz.*, "Modification of the Model By-laws from the Rural Point of View," which will be opened by Mr. Halsey Ricardo, whose knowledge of this subject is well known.

There is no doubt that the problem of rural housing is becoming particularly acute, and that all unnecessary restrictions must be removed, and all possible facilities rendered to enable efficient and sanitary housing conditions to be provided in our rural districts. New legislation is also thought to be called for by the importance of housing conditions upon the industrial unrest. It is urged, as I understand it, that by-laws operating in England framed under sec. 157, Public Health Act, 1875, are too stringent and too rigid. It is quite probable that this may be the case, for while too easy departure from carefully conceived by-laws is to be deprecated, it is obvious that by-laws which may be quite justifiable and desirable in a manufacturing burgh, where there is a great intensity of building of the tenement type, may be unreasonable and unnecessary in a residential or agricultural village, sparsely populated with cottages detached or arranged in short blocks.

There is already power given under sec. 44 of the Housing and Town Planning Act of 1909 to revoke unreasonable by-laws in connection with the erection of dwellings for the working classes. There is also given to local authorities under sec. 55 (2) of the same Act somewhat drastic suspensory powers in connection with by-laws where the local authority prepares or adopts a town planning scheme. This power may be of very great use, but in order that it may be made available it is necessary that a town planning scheme be prepared and approved, when the suspension of by-laws would form part, and would be shown to be in the circumstances, and having regard to the general scheme, reasonable and desirable.

In circumstances such as these there is permitted the full consideration of special conditions and local circumstances which would be denied with by-laws of rigid application.

SCOTTISH POWERS.

Some might think that suspensory powers might be granted without the necessity of preparing a town planning scheme, while others would apprehend thereby confusion and resulting detriment to the public health and safety. In Scotland, between densely crowded cities and vast uncultivated tracts of deer

forest and grouse moor, there is a large range of conditions which would obviously render one, or even two, sets of by-laws insufficient. The larger cities in Scotland, as a matter of fact, operate under powers obtained in special Acts of Parliament.

The Scottish counties, in most cases divided for public health purposes into districts, are empowered under the Public Health (Scotland) Act, 1897, to make by-laws, subject to confirmation by the Local Government Board (Scotland). These are, where existing, less detailed in character than the building rules relating to burghs. In certain respects, the powers of the District Committee in relation to streets and buildings might, with advantage, be extended. The burghs of Scotland are regulated as for streets and buildings by the Burgh Police Acts, 1902 and 1903. Most of the burghs have no by-laws, but rely upon the building rules contained in Schedule IV. of the 1892 Act, and upon secs. 146 1 3 (subject to such modifications thereof as may be introduced by the 1903 Acts).

The Act of 1903, under Part II., which is adoptive, gives powers to burghs to make by-laws in considerable extension of the powers contained under the 1892 Act, but only about two burghs in Scotland have availed themselves of this provision. Under sec. 30 of the Burgh Police Act, 1903, which is of general application, and not adoptive, the Dean of Guild Court is empowered, with the approval of town councils, and upon report by the medical officer of health and the burgh surveyor that adequate provision is made for light and ventilation, "relax or modify all or any of the provisions of the Burgh Police Act with regard to laying out of streets, erection or alteration of buildings, open spaces adjoining buildings, &c. . . . if the Court are satisfied that there are exceptional circumstances justifying such relaxation or modification."

It may perhaps be explained that a Dean of Guild Court is the authority in Scotland for dealing with building plans, very much as they are dealt with by the competent committee of an English town council. To burghs which had no Dean of Guild Courts at the time of the passing of the Burgh Police Act, 1892, power is given by that Act to set up such courts, which shall then consist of the Dean of Guild and two other members of the town council. The composition of the Court varies somewhat in other burghs, but in Edinburgh it consists of the Dean of Guild, appointed by the Guildry, and ten members appointed yearly by the magistrates and council, five of the members being councillors, and the other five registered electors of the city other than town councillors, of whom three must be civil engineers, architects, surveyors, or master builders. Their functions exceed those of an English committee, principally inasmuch as they deal, not only with practical questions such as relate to engineering, architectural, and building operations, which involve questions of fact, but to some extent also deal with questions of law, which relate to possessionary rights.

I merely mention the composition of this Court and their functions in connection with the power under the Burgh Police Act to relax or modify building rules, as it may be considered that some such composition as that of the Edinburgh Court would find general acceptance for the body in England that might be charged with the power and duty of suspending or modifying by-laws upon good cause being shown therefor.

(To be continued.)

SEWAGE POLLUTION OF RIVER MUD.*

By E. L. Dove, M.B., D.P.H.

It has come to my knowledge that in several cases before the Courts the results of the chemical and bacteriological examinations of mud taken from a watercourse have been adduced as evidence in support of the pollution of the stream by sewage. As it is therefore suggested that it is of practical value to make such examinations, I have recently made efforts to ascertain to what extent this evidence is useful and reliable. With this object in view I have examined many samples of mud, collected from sources where human sewage contamination was out of the question, both before and after sewage matter had been allowed to stand upon the mud for several days.

The results warrant the conclusion that chemical and bacteriological examinations conducted on the lines followed in water examinations both fail to furnish any reliable evidence of contamination even after the mud has been exposed to considerable sewage pollution; and unless the pollution is gross, the only reliable evidence of such contamination appears to be the discovery, where possible, by a microscopic examination of certain objects which are significant of sewage contamination. Indeed, my experiments corroborate the following statement which appears in Kenwood's "Public Health Laboratory Work":—

"An examination of the bed of a waterway or pond may serve to furnish corroborative evidence of the sewage contamination of the water. Of such contamination there is little or no reliable indication by chemical analyses, but a low-power microscopical examination and a bacteriological examination may furnish a clue to a gross contamination. If any parts of the bed are covered with gravel or large stones which are not clean, and especially if the greyish flocculent growths characteristic of certain sewage fungi are found to be attached to them or to any other parts of the bed, and if the mud is of a dark colour and emits gas bubbles and offensive odour on being disturbed, then there are good reasons for suspecting gross sewage contamination. It is common in these circumstances to find some opalescent floating bubbles, which have but little tendency to burst, on parts of the overlying water. Although the organic matter in pond and river mud will be found on an ordinary microscopical examination to be largely in the form of unrecognisable *débris*, with only a relatively small (but variable) quantity of the vegetable structure of plant life distinguishable, such objects as a textile fibre or animal hair, &c., would indicate animal contamination."

Road Board Finance.—The abstract of the accounts of the Road Improvement Fund for the year ending March 31st was issued on Wednesday. It shows that during the year £1,209,859 was received from the Consolidated Fund in respect of the proceeds of motor spirit duties and carriage licences. The principal items on the expenditure side are: £244,038 in grants for improvements of roads, £24,823 in loans for improvements of roads, £1,800 in grants for construction of new roads, and £6,663 for salaries and allowances. The fund has no less than £3,202,523 invested. Its loans for improvements of roads, as distinct from grants, amounted to £24,823.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

264. Concrete Beam.—A concrete beam reinforced with steel rods is to be designed to carry a distributed load of 20 tons. The span is 15 ft. Show by calculations what size of beam you would use—the method and formulæ to be as simple and short as possible. ("Greenland Farm.")

266. Surveying.—Describe in detail the operation of measuring a horizontal angle with a theodolite. ("Surveyor.")

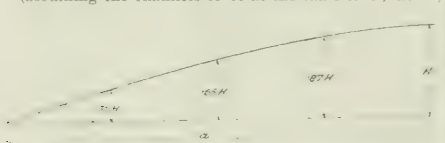
267. Road Making.—Will some reader kindly give the heads of a specification for the conversion of a macadamised into a wood paved road? ("Inquirer.")

268. Text-books.—In what text-books can information be found in regard to (1) Theory of earth pressure suitable for reinforced concrete design; (2) Theory of elastic bridges; (3) Methods of taking float observations to ascertain the probable effect of tides on sewage discharged at different positions along shore? (R. W. T., *Gosport.*)

REPLIES TO QUESTIONS.

262. Wood Paving.—What contour should be given to a wood-paved (soft wood) road 60 ft. in width? Describe the best method to adopt in fixing the screeds. (A. B.)

Undoubtedly the best cross section to adopt for a wood-paved road is the one recommended by Mr. G. F. Deacon in a paper read before the Institution of Civil Engineers, session 1878-9. This section is now in very general use, and is as shown on the sketch appended. Taking the height at the mid width (assuming the channels to be at the same level) as H,



the heights above the channel at the $\frac{1}{4}$, $\frac{1}{2}$ and $\frac{3}{4}$ of the half-section are .65H, .65H and .87H.

The H for wood-paved streets is usually taken as $\frac{a}{30}$ to $\frac{a}{15}$ according to circumstances, the former being adopted when little longitudinal fall can be obtained.

The best method of laying down the screeds is to divide the half-section into four equal divisions, drive in steel pins at these points and mark on them the contour heights. Battens about 3 in. by $\frac{1}{4}$ in. are then embedded in cement mortar to these levels, care being taken that the curve is neatly maintained between the pins. After the screeds have become set the floating is proceeded with, the wood battens subsequently removed and the floating made good. (H. F. W., *Tottenham.*)

265. Strength of Shafting.—A 10-in. shaft has a 4-in. hole run through it. what fraction of its weight is removed? To what extent is its strength in resisting torsion affected?

Weight of hollow shaft as compared with solid shaft of same diameter.

Weight of 10 in. diameter solid shaft $= \pi r^2 lw$

Weight of 10 in. diameter hollow shaft with 4 in. diameter hole $= \pi r^2 lw - \pi r_1^2 lw$

Where r = radius of outside in inches

r_1 = radius of hole in inches

w = weight per cubic inches

Now as all of the formula with the exception of r are constant, the weight varies as the square of the radius—*i.e.*, as $5 \times 5 : 2 \times 2$, 25 to 4, or 16 per cent.

Therefore weight of a hollow shaft 10 in. diameter with 4 in. hole is only 84 per cent of the weight of a solid 10 in. diameter shaft.

The strength of shafting varies as the cubes of the diameters (for solid shafts.)

Hence strength of 10 in. diameter solid shaft is $10 \times 10 \times 10 = 1{,}000$.

Strength of hollow shaft.

$$d_1^3 = \frac{D^4 - d^4}{D}.$$ where D = 9's diameter, d = diameter of hole, and d_1 = diameter of solid shaft of equal strength

$$= \frac{10^4 - 4^4}{10} = \frac{10{,}000 - 256}{10} = \frac{9{,}744}{10} = 9744$$

$$d_1 = \sqrt[3]{9744} = 9{\cdot}91 \text{ inches.}$$

Now as strength varies as the cubes of the diameter our hollow shaft is $\frac{9{,}744}{10{,}000}$ as strong as a solid one, or is 97·44 per cent as strong as solid one.

A hollow shaft with a hole $\frac{4}{10}$ of its diameter and equal in strength to a 10 in. diameter solid shaft would be

$$d_1 = \sqrt[3]{\frac{10^3}{1 - \cdot 4^4}} = 10{\cdot}09 \text{ in. diameter.}$$

(E. W., *Gilwern.*)

STOCKPORT SEWAGE WORKS.

PROPOSED EXTENSIONS.

A scheme for the extension of the Stockport sewage works is being considered by the Corporation Sewage Outfall Committee.

In a report issued by Mr. A. W. Ward, the deputy borough surveyor, it is stated that the daily dry-weather flow of sewage reaching the outfall works is 5,000,000 gallons, as against 2¾ millions in 1902, the increase in a large measure being due to the extension of the borough. Of the 5,000,000 gallons, about 1,500,000 consist of trade waste. The following is the estimated cost of the new works and materials: Separating chamber on high-level sewer, £420; detritus, equalising and precipitation tanks in reinforced concrete, £12,000; 30-in. duplicate feed pipes to filters, £2,475; percolating filters (including £16,625 for new clinkers), £39,800; humus tanks, £3,955; sludge main, &c., from humus tanks, £510; storm-water tanks (additional works) and feed from separating chamber, £1,440; sheet piling the river bank at Butty Warth for tipping purposes, say, £400; total, £61,000.

At a meeting of the town council Alderman Sharples, the chairman of the committee, referring to Mr. Ward's engagement as engineer of the scheme, said the committee had come to the conclusion that Mr. Ward was sound in his advice, practical in the application of it, and was careful as to the expenditure. The services he had rendered to the committee were of an exceptional character, and would be advantageous to the corporation. Alderman Sharples added that he did not think they could do better by seeking outside advice, and the committee were quite satisfied that nothing they had seen or knew of could be an improvement on the scheme proposed.

London County Council Finances.—An abstract of the receipts and expenditure of the London County Council for the ten years ended March 31, 1911, has been issued at the price of 6d. Condensation and rearrangement have resulted in considerably diminishing the size of the publication, but will, no doubt, add materially to its usefulness.

MUNICIPAL WORK IN THE CITY OF LONDON.

CHIEF ENGINEER'S REPORT.

In his report for the year 1911, Mr. Frank Summer, M.Inst.C.E., chief engineer to the Corporation of the City of London, mentions that, with a view to minimising as far as possible any inconvenience that may be caused by carrying out maintenance repairs to pavements in important thoroughfares, instructions were given for experiments to be made by commencing such works at night and continuing them until completed, and for the purpose of ascertaining the actual additional cost incurred, the carriageways of Fleet-street, Ludgate-circus and Ludgate-hill were selected for the trials, which will extend over a period of two years. The various contractors were approached with a view to ascertaining what additional cost this would entail, and the prices they submitted varied from 30 per cent to 50 per cent upon those at present obtaining, which, in the case of main streets, will mean an expenditure of about £6,000 per annum.

EXPERIMENTAL PAVEMENT.

The British Cork Asphalt, Limited, were permitted during the year to lay a specimen of "Corkite" in the footway on the east side of Wood-street (between Love-lane and Little Love-lane) to the extent of about 50 yds. super., on the usual terms and conditions relating to experimental pavements, but it has not been down long enough for the city engineer to speak as to its wearing or other qualities.

STREET LIGHTING.

The lighting of most of the main thoroughfares by arc lamps was continued throughout the year. The number of the original type "open" electric lamps in lighting at the end of the year, at a cost of £26 each, was 332, being a decrease of two. In addition to this number there were 92 "Oliver" and "Excello" flame arcs and 46 metallic filament lamps in lighting during the year. The number of defective electric lamps reported was 81. In addition, there were 21 experimental arc lamps and 46 experimental metallic filament lamps, making a total of 470 electric lamps.

The number of gas lamps (including experimental lamps) paid for by the public health department of the corporation at the end of the year was 2,648, being a decrease of 11 on the previous year. High-pressure gas lighting in Fleet-street was satisfactorily maintained throughout the year. No stoppages occurred, and only a few defective lights were observed. There are (including experimental lighting) 113 other high-pressure "Keith" gas lamps in the City thoroughfares, making 130 in all. The number of low-pressure gas lamps at the end of the year was 2,518, principally consuming 4½ cub. ft. of gas per hour each, the illuminating power being from 60 to 70 candles. When possible, the lamps are fixed on brackets, about 60 ft. to 70 ft. apart on the diagonal, at a height of about 12 ft. from the pavement level to the burner, the cost of each lamp with gas at 2s. 2d. being £3 5s. 7d. per annum, including maintenance of mantles, &c., but not capital charges.

The present cost of lighting the streets of the City with gas is £10,099, and by electricity £10,774, making together an annual charge of £20,873. The corporation, however, have recently made an arrangement with the Gas Light and Coke Company and the City of London Electric Lighting Company for lighting the principal streets with centrally hung lamps in equal proportions, and this will effect an annual saving of £6,830, while an increase in illuminating power of about 600,000 candles will be obtained. In the case of the electric lighting company the corporation will have the option of purchasing the lamp standards, brackets, suspension gear and lamps at the price of £2,000 at the expiration of ten years, but in the case of the gas company the fittings will become the property of the corporation.

STREET CLEANSING AND REFUSE REMOVAL.

The quantity of water used during the year for washing and watering streets and courts was 73,761,668 gallons, the number of nights when it was used being 307. From June to September inclusive the gullies were disinfected at least once a week, and in many places a daily disinfection was carried out, while in the streets adjoining Billingsgate Market the gullies were usualy disinfected three times a day during the summer months.

The quantity of refuse removed during the year amounted to 50,470 cart-loads taken from premises, and 28,113 loads of sweepings and slop from the public ways, making a total of 78,583 loads, or about 262½ per working day during the six days of the week, there being no removal of dust or sweeping of the thoroughfares on Sundays or Bank Holidays.

UNDERGROUND CONVENIENCES.

No record is kept of the number of people using the City conveniences, but some idea of their utility may be gathered from the fact that £8,517 was received during the year under review for the use of the water-closets and lavatories. Free accommodation is provided at all the conveniences for women, and the question of increasing this is now under consideration. The total cost of the upkeep of the structures during the year was £9,910.

BELPER RURAL DISTRICT.

SURVEYOR'S ANNUAL REPORT.

The total cost of maintenance and improvements in connection with the 162 miles of highways in the Belper rural district amounted during the year ended March 31st last to £5,142, or £31 14s. 10¾d. per mile. The payments made from various sources to the credit of highways is £149, reducing the cost to £4,993 nett, or practically £30 16s. 6d. per mile. The estimated expenditure was £4,893, an excess of expenditure over estimate of £100. Included in the above, improvements to the value of £252 were carried out.

The following analysis of expenditure is given in the annual report of the surveyor, Mr. Robert C. Cordon: Manual labour, £1,633 10s. 8d. (31·764 per cent); team labour, £1,040 12s. 9d. (20·235 per cent); materials, £1,548 0s. 2d. (30·100 per cent); miscellaneous accounts, £564 1s. (10·968 per cent); salaries, £338 (6·572 per cent); establishment charges, £18 11s. 3d (·361 per cent); total, £5,142 15s. 10d. (100·000 per cent). The miscellaneous accounts include, among other things, for asphalting, surface-water culverts, drains, and repairs to steam roller.

The council's steam roller consolidated during the year 5,548 tons of stone, covering an area of 70,476 super. yds. of roadway, a daily average of 367 yds. rolled, with 29 tons of stone, each ton covering 12·70 super. yds. of road. The expenditure with the roller was £252, the cost per ton consolidated being 10·87d.

Mr. Cordon mentions in his report that serious consideration will require to be given to the question of a bridge over the river Derwent at Ford-lane, Allestree. At this point the river is nearly 100 ft. wide, and a bridge to carry ordinary traffic will cost approximately £2,000.

The special expenditure on various works of sewage disposal and other engineering works during the year amounted to £506. The scheme of drainage for Crich township, prepared by Mr. Cordon, and estimated to cost £10,250, has received the approval of the Local Government Board, and it is expected that the works will shortly be put in hand.

Enforcing Building By-Laws at Doncaster.—At Doncaster on Monday a property owner was summoned for two breaches of the corporation building by-laws. In the first case, the town clerk said the defendant had constructed a projection from an existing building without submitting plans. The corporation deemed the projection a new building. Defendant contended that all that had been done was to raise a boundary wall, and that was not a new building. The bench decided against the defendant, and inflicted a fine of £5 and costs. In the second case, the summons was for making an addition beyond the front main wall of a house, and the bench imposed a penalty of 5s. a day from August 5th so long as the erection remained.

A South Lincolnshire Water Supply Scheme.—The Local Government Board have sanctioned the purchase by Spalding Rural District Council of that portion of the undertaking of the South Lincolnshire Water Company within the Spalding Union. The works had been carried out by the South Lincolnshire Water Company as part of their scheme to supply the district from Spalding to Sutton Bridge, a distance of 17 miles, but they failed to complete the undertaking, and the matter came into the hands of a Receiver, who agreed to sell a portion of the works to the Spalding Rural District Council for £2,500. In sanctioning the purchase the Local Government Board make it a condition that the council will carry out an offer originally made to supply any surplus water in bulk at a fair price to the other authorities in the district.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Barnard Castle U.D.C. (July 30th. Mr. H. R. Hooper).—£2,971 for (*a*) works of sewerage in the Bridgegate and Thorngate districts, (*b*) works of street improvement in upper and lower Galgate, (*c*) works of water supply in Bridgegate, and (*d*) the provision of an underground sanitary convenience in the Market-place.—The clerk, Mr. J. Ingram Dawson, stated that nothing in the way of improving Galgate had been done for twenty-five years, and the cattle market had been closed, owing to the fact that the regulations of the Board of Agriculture had not been complied with in the matter of the provision of an impervious surface and the enclosing of the cattle. After considering various plans and suggestions, a terraced road was the only one which seemed to meet all the requirements. Evidence with respect to the other matters was tendered.

Cambridge T.C. (August 6th. Mr. M. K. North).—£3,960 for the improvement and widening of the streets surrounding the Market Hill.—The town clerk, Mr. J. E. Whitehead, stated that the scheme included the repaving of the existing market and of Peas Hill and St. Mary's-street; also the reducing of the size of the market, so as to widen the streets all round. The inspector: You know that the board have expressed an opinion that half this sum ought to be charged for market purposes? The town clerk: Yes; and, as I pointed out in my letter, it will benefit the streets rather than the markets. The assistant surveyor mentioned that some of the setts which it was proposed to relay had been down since 1850. The inspector: Isn't that a very long time?—Yes, but they appear to be in good order. We shall, of course, replace those that are worn out.

East and West Molesey U.D.C. (August 9th. Mr. W. O. E. Meade-King).—£1,019 for the improvement of Nightingale-road, Hansler-grove, Matham-road, Feltham-avenue, New-road and Hurst-road.—The surveyor, Mr. J. Stevenson, stated that there was no debt outstanding with regard to any of the footpaths. All the streets complied with the by-laws as to width, except New-road and Hurst-road, which were old public highways.

East Riding C.C. (August 13th. Mr. F. O. Stanford).—This was an inquiry regarding an application for a loan for the reconstruction of Hull Bridge, which spans the river Hull in the townships of Storkhill, Sandholme and Tickton, and which is part of the high road from Beverley to Hornsea, and other parts of Holderness.—Mr. J. Bickersteth, clerk to the county council, said the present old brick bridge had a steep gradient which made it extremely dangerous for vehicular traffic. Towards the cost of the new structure the Road Board had promised £4,000, the Beverley Corporation £500, the Beverley Rural District Council £1,000, and the Skirlaugh Rural District Council £300. It was proposed to raise the rest (£6,700) in one loan, the repayment to extend over thirty years.

Mansfield T.C. (August 6th. Mr. Edgar Dudley).—£5,450 to enable the corporation to carry out improvements in Leeming-street.—The town clerk, Mr. J. H. White, explained that the corporation had entered into provisional agreements to purchase 120 sq. yds. of land from the Kimberley Brewery Company for £3,500, including £500 tenants' compensation. This worked out at £29 per square yard. They had also agreed to purchase 49 sq. yds. from the Mansfield Brewery Company for £1,850, which averaged £38 a yard. Two licensed premises occupied the sites, and the taking of the frontage for this street widening would necessitate rebuilding the houses. The inspector asked for evidence of the price paid for land in the neighbourhood, and the borough surveyor, Mr. T. P. Collinge, said the town council resold land in the same street for prices varying from £7 to £22 10s. a yard.

Petersfield U.D.C. (July 23rd. Mr. P. M. Crosthwaite).—£2,000 for extending the water mains into the rural district, and the provision of hydraulic motor and steam pumping plant, and the construction of a ferro-concrete reservoir of 95,000 gallons capacity. Messrs. Taylor & Wallin (Mr. Harry W. Taylor, Assoc.M. Inst.C.E., of Newcastle-upon-Tyne and Birmingham, are the engineers. There was no opposition.

APPLICATIONS FOR LOANS.

Antrim R.D.C.—£500 for a new burial ground.

Barrow-in-Furness T.C.—£16,400 for public baths, and £5,500 for laying out the public park.

Blyth U.D.C.—£13,830 for an elementary school.

Chesterfield T.C.—£697 for road widening and fencing.

Dartmouth T.C.—£1,050 for the purchase of land for an open space.

Derby T.C.—£3,000 for sewerage works.

Durham T.C.—£1,020 for workmen's dwellings.

East Dereham U.D.C.—£450 for gas supply extensions.

Harrogate T.C.—£1,687 for private street improvements.

Nantwich R.D.C.—£1,350 for works of sewerage.

Nelson T.C.—£1,000 for municipal offices and workshop, and £3,300 for public parks and pleasure grounds.

St. Thomas (Devon) R.D.C.—£600 for three cottages.

Scarborough T.C.—£2,600 for an open-air swimming bath, and £2,250 for cliff protection works.

Sheffield T.C.—£9,000 for a building scheme.

Southgate U.D.C.—£2,350 for an open-air swimming bath.

Torquay T.C.—£6,300 for a 1,000 k.w. turbo-alternator.

Walsall T.C.—£1,000 for alterations and additions to Croft-street schools.

Wilts C.C.—£1,200 for a new school at Idmiston.

Wimbledon T.C.—£10,000 in aid of the Wimbledon and Putney Commons extension scheme.

LOANS SANCTIONED.

Ardsley U.D.C.—£500 for extensions to the cemetery.

Bognor U.D.C.—£2,660 for the provision of workmen's cottages.

Bray U.D.C.—£1,000 for an improved water supply.

Bromley T.C.—£4,247 for street improvement works.

Cookstown U.D.C.—£2,000 for artisans' dwellings.

Dewsbury T.C.—£1,750 for extensions to a school.

Eastbourne T.C.—£2,325 for works of sewerage.

Felixstowe U.D.C.—£243 for extensions to a public convenience.

Grantham T.C.—£1,200 for laying down tar-macadam.

Hendon U.D.C.—£2,562 for street improvement works.

Hereford T.C.—£2,100 for electricity undertaking.

Kensington B.C.—£1,760 towards the cost of a street improvement.

Kirkby-in-Ashfield U.D.C.—£12,000 for the construction of sewage disposal works.

Laurencekirk T.C.—£1,500 for sewage disposal works.

Malden R.D.C.—£600 for water supply works.

Nantwich R.D.C.—£12,500 for the sewerage of Haslington.

Nelson T.C.—£18,904 for works of sewage disposal.

Okehampton R.D.C.—£1,893 for water supply works.

Southport T.C.—£10,683 for a new school.

Stoke-on-Trent T.C.—£16,000 for a school of science and technology.

Wilts C.C.—£3,800 for a new school at Rodbourne Cheney.

BREAKING TESTS OF CONCRETE SLABS FOR ROAD BRIDGE FLOORS UNDER ROLLING LOAD.

To the Editor of The Surveyor.

Sir,—I have not come across any breaking tests of concrete slabs for a heavy rolling load such as on bridge floors, when the stone is the 2-in. size of ordinary concrete work. The following may be of interest—the work was deliberately done under what may be termed the ordinary conditions of a small rural contract job:

A slab of concrete 24 ft. long was laid over rails 2 ft. 9½ in. apart, lying on sleepers. It diminished from 12 in. thick at one end to 4¼ in. at the other. The concrete was composed of 4 parts by measure of middling limestone, hand broken to a 2-in. ring, 2 of good sand, 1 of cement. Another exactly similar slab was made, but with 4 parts of machine-broken limestone, unscreened, maximum stones about 2½ in., and 1 of cement; no sand.

The sandless slab used 9 per cent more cement than the other. It got an unexpected light frost, which, however, did not seem to harm it. It was forty-five days old when tested. The sand one was thirty-nine days.

A heavily loaded cart wheel was first run down the centres of the slabs without effect; then a 10-ton roller (wheels unworn) was run with a driving wheel down the centre of the slabs, a ridge of gravel being first laid down the centre line so that the weight bore fairly in the centre and was not distributed.

The slab of machine-broken stone without sand did not give way at any point, even when bumped over pieces of wood. The slab of 4, 2, 1 did not give way immediately on the first run through, but after a moment or two gave way at 3 ft. 3 in. from the thin end (about 5¼ in. thick), and the engine being slowly backed broke before it to 10 ft. from that end (about 7¼ in. thick), but no further. The broken concrete dropped about 3 in. in the centre. The thick ends were supported right across, but not the thin ends.

Duplicate slabs of both the preceding had been made. These were also tested three days later. The sandless one was now forty-eight days, and was again unaffected throughout. The 4, 2, 1 slab was now a forty-two-day test instead of thirty-nine. It did not give way at the first or second run, but then broke 2 ft. from the thin end (4⅛ in. thick), and remounted at 4 ft. 6 in. from that end (5¾ in. thick).

A fresh experiment was then made. A pair of rails were laid 9 ft. 8 in. apart at one end and 3 ft. 10½ in. at the other, and a slab of uniform 7 in. thickness and 25 ft. 6 in. long was laid over all, composed of the 4, 2, 1 mixture. But the half from the wide end for 13 ft. had one transverse row of ⅜-in. square steel rods at 12-in. centres, turned down 1 in. at ends, and bellied to ¾ in. from under surface of slab in centre, and rising to ¾ in. from upper surface at sides.

A similar test to above was made at forty-seven days. The slab gave way near the narrow end after a moment or two pause, and the engine was driven slowly ahead, breaking before it till within 6 in. of the first reinforcing rod, when it mounted. No effect could be taken on the remainder right on to the 9-ft. 8-in. end, and not even when the wheel was bumped first over small obstacles and finally over a 3-in. piece of iron at good speed. The non-reinforced half of this slab was intended to be considerably thicker, but was made 7 in. in error, and broke, as might have been expected.

I have to thank the generosity and wisdom of my county council for this, to me, very useful experiment.—Yours, &c.,

Jas. P. Burkitt,
Enniskillen. County Surveyor, Fermanagh.
August 12, 1912.

THIRD INTERNATIONAL ROAD CONGRESS.

PAPERS FROM THE UNITED STATES.

During Mr. Rees Jeffreys' visit to the United States of America, a Committee of Selection was formed for the purpose of assisting Mr. Logan Waller Page to nominate the writers of the papers to be contributed by the United States to the International Road Congress, London, 1913. That committee has completed its labours, and the results attained are embodied in the following letter from Mr. Nelson P. Lewis to Mr. Rees Jeffreys. The list of writers is a very strong one, and some valuable papers may be expected from those interested in road problems on the other side of the Atlantic.

[COPY.]

BOARD OF ESTIMATE AND APPORTIONMENT.
City of New York.

August 2, 1912.

W. Rees Jeffreys, Esq.,
General Secretary, London Road Congress,
Broadway, Westminster, England.

Dear Mr. Jeffreys,—On July 5, 1912, I addressed to you a progress report upon the writers of papers for the London Road Congress who had been recommended to Mr. Page. While this list was fairly complete, there were some omissions, and I am reporting now a complete list of authors recommended, all of whom have indicated their willingness to accept invitations to prepare papers.

Question No. 1.—Nelson P. Lewis, chief engineer, Board of Estimate and Apportionment, New York City.
Question No. 2.—Henry B. Browne, Columbia University, New York City.
Question No. 3 Arthur H. Blanchard, professor of highway engineering, Columbia University, New York City; W. W. Crosby, consulting engineer, Baltimore, Md.; Provost Hubbard, Washington, D.C.
Question No. 4.—George W. Tillson, consulting engineer, Borough of Brooklyn, New York City.
Question No. 5.—Dr. Clayton H. Sharp, New York City.
Question No. 6.—W. H. Connell, chief of the Bureau of Highways and Street Cleaning, Philadelphia, Pa.; — Hewes, Office of Public Roads, Washington.
Question No. 7.—William Phelps Eno, Washington, D.C.
Question No. 8.—Paul D. Sargent, Office of Public Roads, Washington; J. C. Travilla, commissioner of streets, St. Louis, Mo.
Question No. 9.—Clifford Richardson, consulting engineer, New York City.
Communication No. 1.—A. W. Dean, chief engineer, Mass. Highway Commission, Boston, Mass.
Communication No. 2.—L. W. Page, director of public roads, Washington, D.C.
Communication No. 3.—A. B. Fletcher, state highway engineer, Sacramento, Cal.; A. M. Johnson, State highway engineer, Springfield, Ill.
Communication No. 4.—John R. Rablin, chief engineer, Metropolitan Park Commission, Boston, Mass.
Communication No. 5.—Morris R. Sherrerd, city engineer, Newark, N.J.
Communication No. 6.—A. G. Batchelder, American Automobile Association; Powell Evans, president, Philadelphia Automobile Club.
Communication No. 7.—Horace M. Swetland, New York City.
Communication No. 8.—Harold Parker, vice-president, Hassam Paving Company, Worcester, Mass.; Prof. Jos. Hyde Pratt, Chapel Hill, N.C.
Communication No. 9.—Arthur Lewis, chief engineer, Lincoln Park Commission, Chicago, Ill.
Communication No. 10.—The Committees on Terminology of the American Society of Civil Engineers and the American Society for Testing Materials.

Where two names are given under any subject it means that the authors are to collaborate either in the preparation of the entire paper, or that each of them will treat of one or more phases of the problem. I hope that you had a pleasant voyage home, and that your impressions of this country have been such that you will want to come again.

Very cordially yours,
(Signed) Nelson P. Lewis.

"Ceresit."—The variety of uses to which this material can be applied in building operations is clearly demonstrated in a booklet which the British Ceresit Waterproofing Company, Limited, of Princes Mansions, 68 Victoria-street, London, S.W., have just issued. Reference to the several sections of the pamphlet is facilitated by means of a thumb-index, and the reader is enabled to turn at once to the information he requires. The value of "Ceresit" as a waterproofing medium for weatherside walls, roofs, cellars, and so forth has long been established, and its efficiency in other directions is equally well known to surveyors and architects.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below. Buildings—Dartford £13,000, East Riding £9,140, Stockport £15,000, Wallasey; housing and town planning—Richmond (Yorks); roads and materials—Nelson, Warwickshire; sewerage and sewage disposal—Derby £3,000, Droitwich £12,603; water, gas and electricity—Elgin, St. Columb, Sheerness £16,950, Widnes £8,500.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

ADMINISTRATION.

Cwyrfai (Carnarvon) R.D.C.—At a recent meeting of the council a complaint was made by the surveyor, Mr. J. Thomas, that certain members of the council persisted in urging him to employ men in whom they were interested either as friends or relatives. Mr. J. Lloyd Williams regarded the practice as most reprehensive, and he moved that the surveyor be instructed not to pay any notice to the requests made to him. The council unanimously endorsed this.

BUILDINGS.

Blackburn T.C.—A recommendation of the Tramways Committee advising the erection of six shelters has been approved.

Chelmsford T.C.—Upon the recommendation of the borough surveyor, Mr. P. T. Harrison, it has been agreed to construct additional cattle pens in the market at an estimated cost of £340.

Chesham T.C.—The tender of Messrs. Rust & Ratcliffe, of Chesham, at £465, has been accepted for the construction of an open-air swimming bath.

Dartford U.D.C.—Designs are being invited for a public hall and free library, to be built on council property. The cost of the former building is not to exceed £8,000, and that of the latter £5,000, and premiums of £75, £50, and £25 are offered.

East Riding C.C.—The tender of Messrs. Braithwaite & Kirk, of West Bromwich, at £9,140, has been accepted for the reconstruction of Hull Bridge, near Beverley. The engineers are Sir John Wolfe Barry and Partners.

Haddingtonshire C.C.—The Western District Committee have accepted the tender of Mr. W. Cuthbert, of Aberlady, at £1,340, for the provision of houses at Gullane, for police and roadmen.

Hartlepool T.C.—A new school is to be erected at Throston to replace existing buildings.

Hereford T.C.—The roof of the butter market is to be reconstructed at a cost of £690.

Hove T.C.—A public lavatory is to be constructed underneath the southern part of the footway leading from Kingsway to Western Esplanade, at an estimated cost of £1,080.

Lindsey (Lincs) C.C.—It is proposed to build a new bridge at Hoddah, on the Lincoln and Saxilby main road, at an estimated cost of £730.

Northallerton R.D.C.—The surveyor, Mr. G. Easdale, has been asked to prepare an estimate of a bridge to obviate the inconvenience caused at times of flood.

Northampton T.C.—The tender of Mr. W. Higgins, at £6,948, has been accepted for the widening of South Bridge.

Pontefract T.C.—Consideration is being given to tenders for the erection of new public baths and [illegible] Mr J. G. Lyon has offered to assist the scheme by defraying the cost of the children's baths, estimated at £600.

Salford T.C.—Plans are being prepared for a new electricity sub-station.—Alterations and additions to the town hall are to be carried out at a cost of £2,042.

Scarborough T.C.—An open-air swimming bath is to be erected in front of Belvedere Gardens, at an estimated cost of £2,600, and protective works are to be carried out on the face of the cliff from the Chil[illegible] Chapel to Black Rock.

Southport T.C.—A lodge is to be built in the Bedford-road cemetery grounds at a cost of £650, and a greenhouse in Victoria Park at a cost of £245.

Stockport T.C.—Extensions to the police buildings are to be carried out at an estimated cost of £15,000.

Wallasey T.C.—The council have called for an amended scheme for the proposed new town hall. The plans prepared show a building estimated to cost £102,000, and the architects have been requested to effect a 15 per cent reduction.

Willesden U.D.C.—The tender of Messrs. Alan Fairhead & Sons, at £1,875, has been accepted for the erection on the Carlton Vale site of a school for ninety defective children.

HOUSING AND TOWN PLANNING.

Bognor U.D.C.—The tender of Messrs. H. W. Newell & Son, at £2,660, has been accepted for building thirteen cottages.

Eastry R.D.C.—Four cottages are to be erected by the council at a cost of £200 each.

Fife C.C.—It is proposed to engage the services of an expert to prepare a planning scheme for North Queensferry, and in view of further developments in the Limekilns and Crombie areas, the master of works for the Dunfermline District Committee has been instructed to prepare tracings showing the boundaries of the areas which are likely to develop and to submit them to an early meeting.

Forehoe R.D.C.—The tender of Mr. H. G. Tofts, of Hingham, at £1,054, has been accepted for the erection of six double cottages at Hingham.

Richmond (Yorks) T.C.—A committee has been appointed to consider the question of building houses for the working classes.

Stockport T.C.—It is proposed to apply to the Local Government Board for authority to prepare a town planning scheme in the urban districts of Cheadle and Gatley, and Hazel Grove and Bramhall.

PARKS AND OPEN SPACES.

Ashington U.D.C.—A scheme has been prepared for laying out Hirst Park at an estimated cost of £4,000.

Broadstairs U.D.C.—A plot of land at Pierremont Park is to be purchased for £2,000 for the purpose of a park and pleasure ground.

Hartlepool T.C.—Half an acre of land fronting Cliff-terrace has been purchased for £500 for the purpose of a park.

ROADS AND MATERIALS.

Antrim C.C.—A letter has been received from the Road Board to the effect that, though recent grants made by the board to the county council in respect of improvements to roads had been very liberal, the board would be prepared to make grants up to £3,000 to the council this year on works of which they were able to approve.

Barnsley T.C.—Several properties have been purchased with a view to the widening of Church-street.

Brighouse T.C.—An important street improvement is to be effected at the Briggate end of Bethel-street by the demolition of a block of buildings and the widening of the thoroughfare.

Camborne U.D.C.—The surveyor, Mr. C. D. Bell, has been instructed to prepare an estimate of making up Highville-street.

Cannock U.D.C.—Street improvement works, [illegible] £1,039, have been approved.

Chorley T.C.—A scheme of road improvement, to cost £6,689, is to be carried out.

Dawlish U.D.C.—The High-street is to be widened, at an estimated cost of £300.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, has presented estimates and plans and specifications (which have been approved) for making up, under the Private Street Works Act, the following roads: Beeches-road, Crowborough, £1,841; Avicen-road, Crowborough, £1,249; Beacon-road West, Crowborough, £225; Warren-road, Crowborough, £468; Melfort-road, Crowborough, £462; Old-lane, Crowborough, £547; Hamsey-road, West Hoathly, £934.

Gainsborough R.D.C.—A new road is to be constructed from Pilham to Bonsdale-lane, at a cost of £300.

Grantham T.C.—The Road Board have granted a loan of £1,200, free of interest for five years, for improvements on the Great North-road in the borough, and as the Local Government Board have sanctioned the arrangement, the council have given instructions for the reconstruction in tarred macadam of High-street, St. Peter's-hill, and a portion of London-road, to be proceeded with as soon as possible.

Greenwich B.C.—That portion of Bramshot-avenue which extends from Wyndcliff-road to Eastcombe-avenue is to be formed and paved, at an estimated cost of £985.

Hastings T.C.—The tender of Bristowe & Co., Limited, of Westminster, at £1,663, has been accepted for laying tar-macadam.

Hendon U.D.C.—A tender has been accepted, at £9,318, for widening and improving the main road from the "Bull and Bush" at Hampstead to Brent-street, Hendon, work rendered necessary by the large increase of traffic.

Kesteven (Lincs) C.C.—As a result of a deputation to the Road Board, that body has agreed to increase the grant of £1,000 for the current year to £1,250.

Nelson T.C.—The borough surveyor, Mr. W. Shackleton, has been requested to prepare plans and estimates for the execution of private street works in several thoroughfares.

Scarborough T.C.—The promenade in the North Bay is to be extended, at a cost of £600.

Settle R.D.C.—Kerbing and channelling works are to be carried out, at a cost of £185.

Shepton Mallet U.D.C.—What would appear to be a policy of extra caution with respect to tar-spraying was disclosed at a recent meeting, when the Highway Committee reported that they had gone fully into the differences between the council and the county council, as to the cost of tar-spraying and had instructed the clerk to forward a statement to the county. Colonel Clerk understood the surveyor was given instructions at a previous meeting to ascertain from various contractors whether if they used their material and did the work of tar-spraying in a proper manner they would guarantee the council against any risk of an action brought against the council for polluting the stream. Had the surveyor made any inquiries? The surveyor, Mr. D. Hinchcliffe, said there had been a lot of correspondence, and a number of interviews with the contractors, but no one came anywhere near thinking they would take the responsibility off the council. A number of letters were read, and the result of interviews relative to the matter were stated by the clerk and the surveyor. Colonel Clerk said he had journeyed all over the county, and found the roads tar-sprayed nearly everywhere but in Shepton Mallet. The policy of not tar-spraying the roads was a benighted one, and they ought to perform their duty as a council and protect the property of the people whose houses adjoined the roads. If the council were afraid to undertake the responsibilities of tar-spraying they ought to see that the roads were properly watered. Mr. Halstead said the county council would not take any responsibility when tar-spraying was carried out within half a mile of a stream, and said unfortunately in Shepton Mallet the roads in the majority of cases ran parallel with the stream, or near it. Mr. Allen said if they did anything which might be suspected of polluting the stream they would find themselves in "queer street." It was ultimately left to the Highway Committee to investigate and report whether there had been any pollution of the stream from tar-spraying.

Tottenham U.D.C.—The engineer and surveyor, Mr. W. H. Prescott, has submitted a report in connection with the consideration of the improvement of the main roads within the area of Greater London. One of these proposed roads is designed to relieve the rapidly growing traffic along the two existing roads from Finsbury Park to Enfield, and from Tottenham through Edmonton and Cheshunt to Ware and Cambridge. It had been provisionally styled the proposed new Cambridge-road. The other proposed road affecting Tottenham, he said, was known as the North Circular-road, and this had been suggested with a view to enabling traffic to pass round London and to avoid congested streets in the central area. It commences at Chiswick, and passes Brentford, Ealing and Acton, through Ballard's-lane, Finchley, and Colney Hatch, along Bowes-road, New Southgate, through Edmonton, to Higham's Hill, Epping, and New Wanstead. The proposed width of both roads was 100 ft. each, but nothing could be ascertained as to the financial aspect of the question.

Warwickshire C.C.—The council have agreed to apply to the Road Board for grants in support of the following schemes: Sutton Coldfield widening and strengthening of the Tamworth main road, estimated cost £1,500; Coventry and London main road from Northamptonshire boundary to Dunchurch—strengthening foundations and tarmacing, estimated cost £7,250; Watling-street, from Quarry Hill, Wilnecote, to Birch Coppice, and again from Mancetter House to the end of the Warwickshire length by Lindley Park—strengthening and tarmacing, estimated cost £6,569; also an application by the Atherstone Rural District Council for a grant towards the cost of tarring 12,000 sq. yds. of highway from Chapel Hill through the village of Hartshill.

Wembley U.D.C.—The Road Board have agreed to lend £2,900 free of interest for four years towards the improvement of Pinner-road, the main road between Wembley and Harrow.

West Sussex C.C.—The county surveyor, Mr. H. W. Bowen, has reported on the unsatisfactory way in which the district foremen recently appointed had discharged their duties, and it has been decided to abolish the appointments of district foremen, and that the county surveyor be authorised to appoint in their place district surveyors to work under his direct control. This arrangement would mean an expenditure of £9 10s. per week in place of £10 as at present, but it was recommended that the salaries of each of the officials appointed be raised by annual increments of £5 for the next five years.

SEWERAGE AND SEWAGE DISPOSAL.

Brierley Hill U.D.C.—The tender of Messrs. J. Guest & Son, at £3,115, has been accepted for making house connections to main sewers.

Derby T.C.—The sewers in the Ormaston district are to be improved at an estimated cost of £3,000.

Droitwich R.D.C.—Mr. Fiddian's plans have been approved for the construction of sewage disposal works for North Claines, at an estimated cost of £12 603.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, estimates the cost of surface-water drainage works in the Crowborough roads at £979.

Godalming T.C.—It was reported at the council meeting recently that all the crops on the sewage farm were looking wonderfully well, the only shortage being in oats. In regard to stock, the Sanitary Committee received £100 from the council in the first instance, and on a rough estimate their stock was now worth £250, and they had £40 cash in hand.

Hove T.C.—In consequence of the withdrawal of a tender for the construction of new sewers in Queen's-gardens, Grand-avenue The Drive, Holland-road, and Davigdor-road, the Works Committee recommend the acceptance of the next lowest tender, that of Messrs. George Bell & Son, Limited, Bruce Grove-road, Tottenham, London, for £7,344. The council are also recommended to construct an underground lavatory for both sexes underneath the southern part of the footpath leading from Kingsway to the Western Esplanade and opposite the south end of Carlisle-road, in accordance with a scheme submitted by the borough surveyor, Mr. H. H. Scott. This will cost approximately £1,080, and provides for the lighting of the lavatory being obtained entirely from prismatic lights in the roof, and the ventilation secured by ventilators placed among the shrubs in the adjoining bank.

Winchcombe R.D.C.—The tender of Messrs. Johnson Brothers, of Hereford, at £2,937, has been accepted for the carrying out of the sewerage works at Bishop's Cleeve, near Cheltenham.

Worthing T.C.—With respect to the provision of an additional outfall for surface water, and the construction of new surface drains in various roads at the west of the town, to discharge into the West Worthing outfall, the Sanitary Committee recommend that the surveyor, Mr. F. Roberts, be instructed by the council to prepare the necessary plans and estimate for submission to the council. A scheme

has also been considered from the committee for the provision of additional pumping plant and new outfall in connection with the sewage works, and the council are recommended to give provisional approval, and instructions to the surveyor to prepare the necessary plans, estimate, &c., to enable application to be made to the Local Government Board for a loan.

WATER, GAS, AND ELECTRICITY.

Elgin T.C.—An improved water supply is contemplated, including the construction of a new reservoir, at an estimated cost of £8,000.

Gainsborough U.D.C.—The services of a consulting engineer are to be retained for the purpose of considering an improvement in the water supply.

Godalming T.C.—A sum of £978 has been allocated from the profits of the water undertaking in aid of the rates.

Lanarkshire C.C.—Additions have just been made by the council to the electric supply station at Cambuslang. The capacity of the station has been doubled, and its arrangements modernised. The feeder cables supplying the district have also been doubled, and already the increased demand for current has justified the outlay.

St. Columb T.C. The provision of an additional water supply is to be considered by the council.

Sheerness U.D.C.—Mr. F. W. G. Stanton has prepared plans for a constant water supply, estimated to cost, inclusive of machinery, £16,950, and they have been forwarded to the Local Government Board.

Sheffield T.C.—There was a surplus of £9,969 upon the working of the water undertaking last year.

Widnes T.C.—To cope with the increasing population at Sutton Manor and Bold it is proposed to construct a new water tower on Pex Hill at an estimated cost of £8,500. The tower will have a capacity of 500,000 gallons. An extension of the gas supply is also proposed.

MISCELLANEOUS.

West Hartlepool T.C.—It has been decided to purchase the remaining tramway routes not already acquired by the corporation, and to appoint a general manager of tramways at a salary of £200 a year.

PERSONAL.

Mr. Peter Sinclair, burgh surveyor of Carnoustie, has been voted an increase of salary.

Mr. F. A. Delamotte, borough surveyor of Conway, has had his salary increased by £25 per annum.

Mr. J. F. Hawkins, county surveyor of Berkshire, has had his salary increased to £750 per annum.

Mr. H. C. Crummack, borough surveyor of Hartlepool, has had his salary increased by £30 per annum.

Mr. W. Shackleton, borough engineer and surveyor of Nelson, has had his salary increased by £50 a year.

Dr. Gilbert J. Fowler has removed from Broad Oak, Urmston, to Rufford, Dickenson-road, Rusholme, Manchester.

Mr. James Hammond, surveyor to the Bedale Rural District Council, has had his salary increased by £25 per annum.

Mr. E. J. Saunders, surveyor to the Leighton Buzzard Urban District Council, has been voted an increase of salary.

Mr. T. Moss, surveyor and gas manager to the Withnell Urban District Council, has had his salary increased by £33 per annum.

Mr. W. Epton, surveyor to the Welton (Lincs) Rural District Council, has been voted an extra £20 a year for the employment of a clerk.

Mr. Fred. Wilkinson, surveyor to the Prestatyn Urban District Council, has, we are pleased to state, recovered from his recent illness.

Mr. J. S. Hurst, assistant surveyor of Bridlington, has been appointed borough surveyor and inspector of nuisances at Southwold at a salary of £130.

Mr. B. Comb, of Chesterfield, has been appointed surveyor to the Whittington and Newbold (Derbyshire) Urban District Council, at a salary of £150 a year.

Mr. S. Dean, assistant surveyor to the Greetland (Yorks) Urban District Council, has obtained an appointment in the surveyor's department at Barnoldswick.

Mr. F. Kirby, of Bishop Auckland, assistant in the Auckland surveyor's department, has been appointed assistant surveyor to the Sedgefield Rural District Council.

Mr. William Moser, of Nelson, has been appointed engineering assistant in the borough surveyor's department of the Nelson Corporation, at a salary of £85 per annum.

Mr. E. Cuthbert, surveyor to the Bulkington (Nuneaton) Urban District Council, has resigned after nearly forty years' service. Mr. Cuthbert is seventy-nine years of age.

Mr. George Sutcliffe, of Halifax Corporation waterworks, has been appointed chief water inspector to the Loughborough Corporation out of eighty-six applicants, and Mr. Thomas Tyler, of Loughborough, has been appointed assistant water inspector out of 105 applicants.

Mr. H. J. Bennett, for many years surveyor and inspector to the Northwich Rural District Council, died, we regret to state, somewhat suddenly on the 1st inst., in his seventy-fourth year. Since his retirement from active service Mr. Bennett had been consulting engineer to the council.

Mr. H. E. Goldsmith, of the Public Works Department, Hong Kong, whose transfer to membership of the Institution of Municipal and County Engineers was recently noted in our columns, should have been described as chief assistant to the executive engineer in charge of municipal work generally, Public Works Department, Hong Kong.

Folkestone Town Council have made the following appointments in the borough engineer's office, consequent on the resignation of Mr. L. Luck, who has received an appointment at Walsall: Mr. H. F. Jackson, third assistant, to be second assistant, at a salary of £117 per annum; Mr. W. S. Pain, fourth assistant, to be third assistant, at £78 per annum; Mr. H. St. G. Tolputt, temporary assistant, to be fourth assistant, at £65 per annum; Mr. H. Dunglinson to be tracing clerk at £52 per annum.

Mr. W. E. Blizard, STUD.INST.C.E., B.SC. (Engineering, London), the younger son of Mr. John H. Blizard (Sir James Lemon and Blizard, MM.INST.C.E.), has been appointed assistant civil engineer in the Indian Public Works Department. He has been posted to the United Provinces on irrigation work, and will sail for India in the P. and O. steamer "Maloja" on September 27th next to take up his appointment. His brother, Mr. J. Mortimer Blizard, ASSOC.M.INST.C.E., is the assistant sanitation engineer of Colombo, Ceylon.

Dr. Galbraith, Dean of the Faculty of Applied Science of the University of Toronto, has been elected as chairman of a Canadian Committee which has been formed to undertake the necessary organisation work for the forthcoming International Road Congress. Mr. W. A. McLean, provincial highways engineer, is the hon. secretary, and the other members are Major T. L. Kennedy, president of the Ontario Good Roads Association; Mr. W. G. Trethewey, chairman of the York County Highways Commission; Mr. Hiram Donkin, Commissioner of Highways for Nova Scotia; Mr. C. H. McLeod, of Montreal, secretary of the Canadian Society of Civil Engineers; and Mr. W. J. Kerr, of New Westminster, B.C., president of the Canadian Highways Association. The Right Hon. R. L. Borden has been offered the honorary chairmanship of the committee, the formation of which is the result of the visit to Canada of Mr. W. Rees Jeffreys, the secretary to H.M. Road Board.

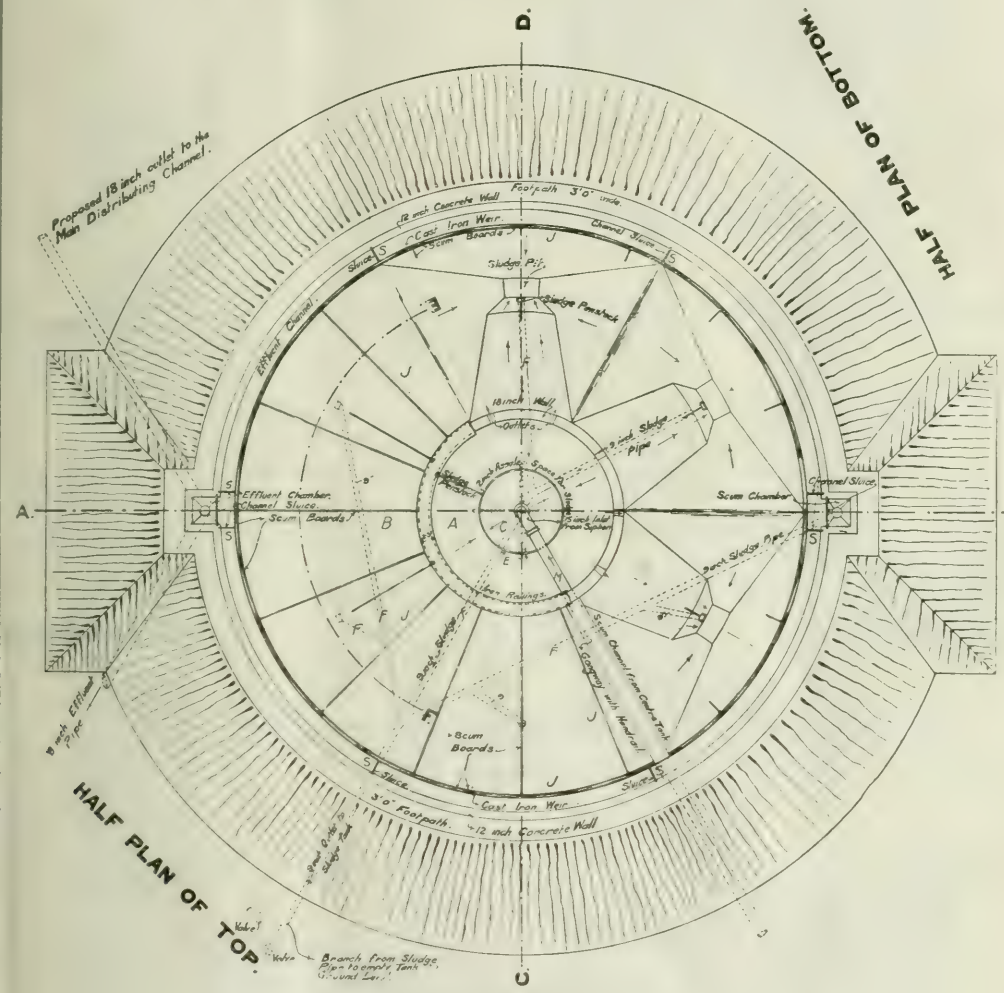
In the list of successful candidates at the recent final examination for the degree of Bachelor of Science (Engineering), London University, appears the name of Mr. H. M. Webb, a pupil of Mr. Thomas Caink, ASSOC.M.INST.C.E., city engineer, Worcester. Mr. H. E. Lunn, of the borough engineer's department, Islington, N., a former pupil of Mr. Caink, was also successful at the same examination.

Saddleworth Housing Scheme.—The erection of fifty-five cottages, estimated to cost £16,000, is proposed by the Saddleworth (Yorks) Urban District Council.

THE CLARIFICATION OF SEWAGE.

THE "FIELDHOUSE" TANK.

In our issue of October 21, 1910, in connection with a meeting of the Institution of Municipal and County Engineers, reference was made to the construction at Guildford of a "Fieldhouse" sewage tank, the advantages of which, as compared with square or rectangular tanks, were set out by the borough engineer, Mr. C. G. Mason, ASSOC.M.INST.C.E. The Ames Crosta Sanitary Engineering Company, Limited, 12 Victoria-street, Nottingham, the sole agents, have now issued a pamphlet in which a detailed description, accompanied by diagrams, is given of the tank.



THE "FIELDHOUSE" TANK.

It is realised by the patentees that the construction of tanks for continuous running, in order to give the necessary facilities for the removal of the deposit and scum and for producing an equalised effluent with the greatest freedom from suspended solids, must of necessity increase the capital cost compared with the ordinary type, capacity for capacity, but they point out that this is only first cost, while the advantages due to the saving in labour in tank manipulation, attention to distributing apparatus, and the extended life of filtering area, together with more uniformly satisfactory results obtained with less worry and expense, far more than compensate for the extra cost. It is stated that the original cost of the "Fieldhouse" tank may be reduced by constructing this form of tank 25 per cent to 50 per cent less in capacity than tanks of the ordinary type, the ground for this assertion being that the latter do not give the same facilities for producing a uniform highly clarified tank effluent, are incapable of dealing with large, increased flows, and do not possess proper means for the removal of deposit or scum without emptying the tank. Moreover, it is pointed out, the perfect displacement and reduced stagnation allows of a fresher sewage and a more clarified tank liquor being secured in a much shorter period of time.

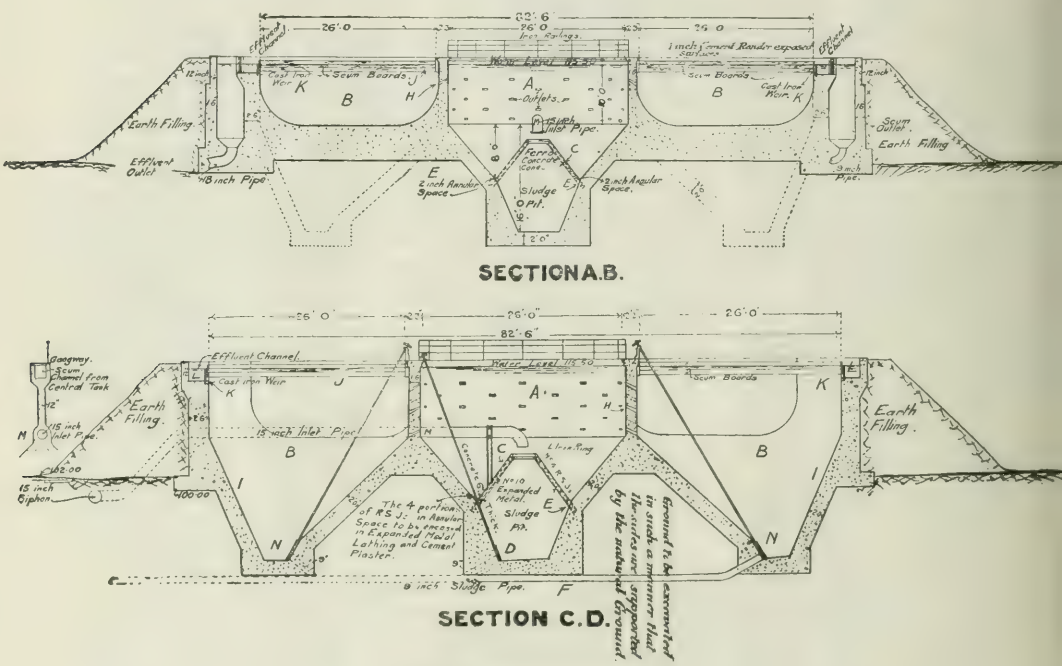
OPERATION OF TANK.

The sewage enters along pipe "M" and passes to inner or roughing chamber "A," where the bulk of the heavier solids are deposited, passing by gravitation to underside the inverted cone "C." The object of the cone "C" is to prevent the deposit being churned up and to form an annular space "E" to allow depositing solids to settle, to be afterwards removed through the valve "D."

The liquid, after depositing its heavier solids in tank "A," passes through pigeon holes or passages "H" to outer tank "B," these passages "H" being constructed so as to cause even displacement and to deflect the finer depositing solids which have a downward tendency towards the collecting chambers containing penstocks "N" in the deposit chambers before passing under slide or scum boards "J" and over sill or weir "K" into channel "L." The scum boards "J" are made to dip below the surface according to the process adopted. From the point of entrance to the point of exit the liquid is constantly spreading

outward, covering a larger area, and consequently reducing its velocity as it approaches the weir "K," and by this means the most clarified and oxidised effluents are obtained.

On opening the valve "D" the deposit is forced by the head of water down the sludge pipe "F." The inverted cone "C" tends to prevent a column of liquor flowing down the pipe, and also deflects the liquor on to the sloping sides of the sludge well, cleansing them from deposited solids as the sludge is forced out. The outer tank is divided into sections, according to the size of the tank; at the bottom of each section is constructed a chamber with a valve "N" to sludge pipe "F." The bottom of each section is formed with inclined faces to allow the solids to be deposited near the valve "N" ready for withdrawal on the opening of the valve. The outer inclined face "I" is formed at a sufficient inclination as to prevent accumulations of solids, thereby preventing any decomposing deposits being again thrown into suspension near the weir "K." The outer tank "B" is divided into sections by radial scum boards "T," and end slides or scum boards "J" which form traps and prevent the wind from breaking up any scum and causing the liquor to be weired over unequally. To remove the scum from the tank. The latter is, of course, of the greatest importance in any continuous sewage tank, as if not regularly carried out septic action and aërial nuisance rapidly occur.



The "Fieldhouse" Tank.

scum, the end slides "J" or slides "S" are closed down and the tank allowed to head up, when, on removing one or more end slides "J" and a slide "S," the increased head causes the scum to be readily floated into channel "L" to be conveyed to sludge tank or on to the land.

Generally, it is claimed that a more uniform effluent is obtained in this form of tank, as the incoming sewage is forced to mix with the liquor already in the tank by spreading outward as it goes forward towards the sill or weir "K" into channel "L." Thus when the trade wastes are entering tank "A" it is impossible for them to leave the outer tank without first undergoing a thorough mixing with the other sewage, much more so than is possible in straight or upward flow tanks of the usual construction. The effluent is much freer from suspended solids, owing to the reduction of velocity and the very large weiring surface, which allows the flow to pass away in a thin film at the greatest distance from the inlet, thus avoiding currents which carry out solids that may be in motion due to gases or from other causes. In addition to the large weiring surface, there is also the possibility of keeping the tank at its maximum capacity on account of the easy means of periodically withdrawing the deposit or

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE, WEST HAM: PRELIMINARY NOTICE.

The annual conference of the Municipal Tramways Association (Incorporated) will be held in West Ham on September 25th, 26th and 27th next. De Keyser's Hotel, Victoria Embankment, E.C., has been selected as headquarters for delegates, and the following programme has been arranged: —

September 25th.

10.15 a.m.—Reception by the Mayor and West Ham Council.

10.30 a.m.—Presidential address by Mr. H. E. Blain, tramways manager, West Ham.

Paper: "Tramways Administration by Municipalities: A Retrospect and a Forecast," by Mr. Councillor S. C. T. Neumann, deputy-chairman Bradford Tramways Committee.

1 p.m.—Luncheon.

2 p.m. Proceed to Tramways Depot, Greengate-street, Plaistow, by special cars.

2.15 p.m. Discussion on the interim report of the Corrugation Committee.

3.30 p.m.—Inspection of depot and of the Exhibition of Tramway Appliances, &c.

7.30 p.m.—Corporation reception at the town hall.

September 26th.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, Assoc.M.Inst.C.E., Borough Surveyor, Windsor.

ANNUAL DISTRICT MEETINGS.

The annual district meetings of the South-Eastern and Southern Districts of the Institution of Municipal Engineers were held in the Council Chamber, at 39 Victoria-street, on August 7th. The following reports were presented by the honorary secretaries of the respective districts.

SOUTH-EASTERN DISTRICT.

I beg to submit the third annual report of the South-Eastern District Committee of the Institution of Municipal Engineers.

The second annual general meeting was held at the offices of the Institution, 39 Victoria-street, Westminster, on July 3, 1911, when Mr. Henry C. Adams was again re-elected chairman and Mr. Bernard Partridge honorary secretary. During the past year the following district meetings have been held:—

October 11, 1911, at Brentwood, when a visit was paid to the new sewage works and a paper upon their construction was read by Mr. J. Edward Willcox, of Messrs. Willcox, Raikes & Read, the engineers. There were 65 present.

March 6, 1912, at 39 Victoria-street, when a discussion was opened by the chairman (Mr. H. C. Adams) on "The Methods of Inviting Public Tenders."

May 22, 1912, at 4 Southampton-row, when a paper was read by Dr. John F. Meyer, entitled "Notes on Water Softening" and afterwards was very fully discussed. There were over 40 present.

In addition to the above there were four general meetings of the Institution held in the district during the year as follows:—Windsor, October 21, 1911; London, December 16, 1911; London, February 24, 1912; Hendon, June 12, 1912.

The district committee has during the past year been represented on the council by the following gentlemen: Messrs. W. Louis Carr, C. H. Eyles, A. J. Meeson, H. C. H. Shenton, with Mr. H. C. Adams as vice-president.

The number of members and students of the Institution in the district at present is 67.

It is with regret I have to report the resignation of Mr. Bernard Partridge, the honorary district secretary, who has left the district.

J. Woolford Brook,
Acting Hon. District Secretary.

SOUTHERN DISTRICT.

I have to submit a short *résumé* of the work done by the district committee during the past year, together with notes of meetings held in or near the district, although not actually district committee meetings.

As will be seen by the "Minutes," four district meetings have been held, namely:—

1. Annual meeting (July).
2. Meeting at Lewes and Seaford (September).
3. Meeting at London. Mr. Palmer's paper (May).
4. Meeting at London. Superannuation and Security of Tenure (June).

Other (general) meetings of the Institution in or near the district have been:—

1. Annual general meeting, Windsor (October).
2. General meeting, London (December), for Mr. Horace Boot's paper on "The Electric Trolley Omnibus System and Railless Traction."
3. General meeting, London (February), for Mr. Winter Gray's paper on "Superannuation and Security of Tenure."
4. Visit to Messrs. Doulton's, Lambeth (June).
5. General meeting at Hendon (June).

It is interesting to note that in connection with the latter three of the meetings held were at the initiation of members of our own district: Mr. E. A. Stickland, our president; Mr. Horace Boot, our chairman; and Mr. Winter Gray, member of council.

There has thus been no paucity of opportunity for members to inspect works and join in discussion of papers which have been of undoubted value and assistance, the subjects embracing all of greatest moment to surveyors generally, including sanitation, workmen's dwellings, railless traction, aviation, and superannuation.

I should like, however, to see more meetings held in the outlying portions of the district, and it only needs the co-operation of members resident therein to ensure this. The interest thus obtained means a larger membership of the Institution, and benefits individual members by the intercommunication of ideas and experience of varying methods of practice.

In conclusion, I have to acknowledge my grateful thanks to our chairman, Mr. Horace Boot, for the great assistance he has always rendered me, to Mr. Taylor for his work in connection with the meeting at Lewes and Seaford, to the gentlemen who have read papers, and last but not least, to the secretary, Mr. Wyand, who is ever ready to help on the fortunes of the Institution.

Ernest W. Veale,
Hon. District Secretary.

The only remaining business of the meetings was the election of officers for the year 1912-13. For the South-Eastern District Mr. Henry C. Adams, vice-president of the Institution, was re-elected district chairman, and Mr. J. Woolford Brook was elected honorary district secretary. For the Southern District Mr. Horace Boot, vice-president, was re-elected district chairman, and Mr. Arthur Palmer was elected honorary district secretary. Votes of thanks for their long services were passed to Messrs. Bernard Partridge and E. W. Veale, the retiring officers.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. BRADFORD.—October 9th.—For the construction of circular outfall sewer in tunnel, and two shafts, for the corporation.—Mr. Frederick Stevens, town clerk.

Northumberland Roads.—The county surveyor, Mr. J. A. Bean, in his annual report, states that the expenditure for the year ended March 31st last, in the maintenance of 616¾ miles of main and subsidised roads in Northumberland, was £57,097, against £57,057 in the previous year. The cost per mile during the past five years has been as follows: Year ended March 31, 1908, £85 9s. 2d.; 1909, £81 6s. 4d.; 1910, £92 13s. 5d.; 1911, £92 10s. 8d.; 1912, £92 11s. 11d. The year ended March 31, 1912, was the first year in which the council had received a grant from the Road Board towards the main roads of the county. The amount received was £8,500, of which sum £6,925 was spent, the balance of £1,575 being brought forward to the current year. The council had ascertained from the Road Board their precise specification for road making, and the principle was precisely similar to the one adopted by the council with the exception that sand was added for the purpose of preventing the tar coming to the surface in hot weather. This had been adopted, and it was hoped would be effective. The report added that the year had been a good one for tar-grouting roads.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

ATCHAM.—For the construction of 5,100 yds. of sewer, for the rural district council.—Mr. H. Asher, surveyor:—
